and about 500 students in the University of Panamá, besides various special, normal, and vocational schools. Roman Catholicism is the dominant religion but other faiths have a considerable following.

**Production.** The chief occupations are agriculture, cattle raising, lumbering, pearl fishing, commerce, and the tourist business. Bananas are the chief domestic export; shipments were about 5,413,154 stems valued at \$2,429,921 in 1939. Sugar production in 1939 was 7727 metric tons. Some gold and salt is mined and there is manufacturing on a small scale for local consumption. A total of 118,833 passengers transited the Panama Canal during 1939, an increase of 1392 over 1938, and the tourist trade benefited.

**Foreign Trade.** Imports in 1939 were valued at \$20,464,000 (\$17,651,000 in 1938); exports and re-exports, \$6,826,000 (\$7,669,000). The United States furnished 58.2 per cent of the 1939 imports (Japan, 9.8; Germany, 7.9) and purchased 85.8 per cent of the domestic exports (Germany, 4.0). See TRADE, FOREIGN.

**Finance.** Budget receipts and expenditures for the biennial period 1939-40 were estimated to balance at \$22,795,000. For the period Jan. 1, 1937 to June 30, 1938, actual budgetary revenue was \$14,441,000; expenditure, \$15,171,000. The public debt on Dec. 31, 1939, totaled \$21,567,961 (internal, \$2,833,390; held in United States, \$18,684,571). The unit of currency is the balboa, equivalent to one U.S. dollar.

**Transportation.** Including the Canal Zone, Panama has 230 miles of railways; 726 miles of roads (248 miles of modern surfaced highways); a local air service linking Panamá with David (233 miles) and San José, Costa Rica; and the Panamá-Cristóbal air service (35 miles), connecting at Panamá with Pan American Airways' international network. Practically all overseas trade passes through the Canal Zone ports of Cristóbal (serving Colón) and Balboa (serving Panamá). Congestion at these ports in 1940 led the government to authorize a survey for a modern port at Panamá. For shipping, see PANAMA CANAL.

**Government.** The Constitution of 1904, amended in 1918 and 1928, vested executive power in a President elected by direct popular vote for four years and ineligible for re-election. Legislative power was placed in a National Assembly of 32 members elected for four years, meeting biennially on September 1. For the new Constitution adopted in 1940, see below under *History*. President at the beginning of 1940, Dr. Augusto S. Boyd, who assumed office on the death of President Juan Demóstenes Arosemena Dec. 16, 1939.

## HISTORY

**Presidential Election.** The presidential campaign started in 1939 (see YEAR BOOK, 1939, p. 593) reached the expected conclusion on June 2, 1940, when Dr. Arnulfo Arias, candidate of the government coalition, and the government's candidates for the National Assembly were elected without opposition. Dr. Ricardo J. Alfaro, former Provisional President and former Minister to Washington, entered the presidential race with the support of the Socialists and three other small parties. However the electoral battle engendered extreme bitterness and on May 31 Dr. Alfaro issued a manifesto asking his supporters to boycott the polls on the ground that the government machine had made a fair election impossible.

During the campaign Dr. Alfaro repeatedly

charged the government parties with using violence, coercion, and petty persecution to elect their candidates. Acting President Ernesto Boyd in turn accused the Alfaro supporters of subversive and provocative actions. On April 28 police seized an arms cache, arrested a number of opposition politicians and charged them with plotting a revolution. On May 26, 10 more leading members of the parties supporting Alfaro were jailed on conspiracy charges. Dr. Alfaro and many other oppositionists took refuge in the Canal Zone, where they remained until requested to leave by Maj. Gen. Daniel Van Voorhis, United States military commander of the Zone, on June 4. Dr. Alfaro then returned to Washington, where he had resided previous to the presidential campaign. He declared the conspiracy charges against his followers were frameups to justify the suppression by the government of "every right, every liberty, and every constitutional guarantee."

**New Constitution.** Upon his inauguration on October 1, President Arias outlined his policy as one of "peace and friendship toward all nations." Urging improved educational facilities and control of public information, he called for a revision of the Constitution along "democratic and unitarian" lines. The draft of the new Constitution was submitted to the National Assembly on October 17. It was unanimously approved on November 22, ratified by a plebiscite on December 15 (the vote was officially reported at 144,312 to 1865), and went into effect on Jan. 2, 1941, under a decree promulgated by President Arias on December 24.

The new Constitution extended the terms of office of the President and members of the National Assembly from four to six years and increased the powers of the President. It guaranteed the right of private property but stipulated that "private interest must give way before public social interest," and that "for reasons of public utility or of social interest" expropriation might take place by judicial decree and with "just previous indemnity." Labor was declared a social obligation and placed under the special protection of the State, which was authorized to regulate the relations of capital and labor. The right to strike was guaranteed except as to public services. Entry into Panama of members of the Negro race whose original language was not Spanish, the yellow race, and the original races of India, Asia Minor, and Northern Africa was prohibited. The government was authorized to operate public utilities, regulate prices, and establish monopolies for raising revenue, but private monopolies were prohibited. The Roman Catholic Church was recognized as the church of the majority of the people, but freedom of religion, speech, and assembly was guaranteed. Provision was made for reconstitution of the Supreme Court through appointment by the President, with the consent of the National Assembly, of five principal magistrates and five alternates, one of each being appointed every two years for a period of 10 years.

**Criticisms of Government.** The nationalistic economic and political provisions of the new Constitution aroused much criticism among Panamanian leaders not affiliated with the government. Former President Harmodio Arias, brother of the new President, led the attack upon the new administration in his newspaper the *Panama American*. The President was accused of totalitarian tendencies and of disregarding the provisions of the 1904 Constitution in securing the enactment of the new fundamental law. The 1904 document pro-

vided that constitutional amendments must be approved by two separate sessions of the National Assembly, and made no provision for a national referendum such as that of December 15. Nevertheless the Supreme Court accepted the legality of the new Constitution in a decision of December 28.

Seventy revolutionist attacked the police station at Chorrera, 20 miles from Panamá, on October 20 but were beaten off. A number of arrests were made of persons charged with plotting a general revolt throughout the interior.

**Relations with United States.** Steps were taken by the governments of Panama and the United States to carry out the highway projects agreed upon in 1939 (see 1939 YEAR BOOK). Early in 1940 the Export-Import Bank at Washington advanced a \$2,500,000 loan to Panama for the construction of the strategic and commercial concrete highway between La Chorrera and Río Hato, the new United States auxiliary air base. The United States Congress contributed \$1,500,000 toward this project. The joint highway board called for under the Trans-Isthmian Highway Convention was established early in 1940 to supervise the Panamá-Colón highway project. Meanwhile Panama proceeded with construction of part of the roadbed. During his visit to the Canal Zone in February, 1940, President Roosevelt conferred with President Boyd and other Panamanian officials. He later announced that the Panamanian Government had authorized use of airfields anywhere in the republic by American military planes if necessary for the wartime defense of the Canal.

Following the German conquest of Norway and the Low Countries, Panama curbed the activities of Germans and pro-German elements. A number of German-born teachers in the Instituto Nacional, some naturalized in Panama, were dismissed. In August the government barred entry to 25 Costa Ricans who had signed a pro-German manifesto. At the same time the police made a checkup of aliens in the republic. They were reported to have found more than 1200 German Nazis, Italian Fascists, and others having passports issued by countries conquered by Germany. The newspaper *Panama American* on September 8 declared it significant that "the defeated, Nazi-dominated France of Pétain" had assigned military and naval attachés to the French Legation in Panama although the French Republic had never considered such a step necessary. The National Assembly on September 25 unanimously adopted a resolution urging the Spanish Government not to join Germany and Italy in the European War.

On April 13 fire swept through the tenement section of Colón, destroyed hundreds of frame dwellings, and left 10,000 persons homeless. A third of the city was destroyed, with damage estimated at \$4,000,000. On April 5 the Panamanian Government announced that, subject to the approval of 80 per cent of the bondholders, the two outstanding dollar bond issues would be refunded at lower interest rates and provision made for repayment of interest arrears.

See COLOMBIA under *History*; PAN AMERICAN-ISM.

**PANAMA CANAL.** The Panama Canal crosses the Isthmus of Panama between Limón Bay on the Caribbean coast and Panama Bay on the Pacific Coast. Its length from shoreline to shoreline is 40.27 miles. The U.S. Government owns and operates the canal. A strip of territory bordering either side, held and governed by the

United States, constitutes the PANAMA CANAL ZONE (q.v.).

**Yearly Traffic.** For the calendar year 1940, ships crossing the Isthmus of Panama numbered 6026 (for 1939, 6845); the tolls paid to the Panama Canal for such crossings amounted to \$19,981,248 for 1940 (\$23,744,476 for 1939). German ships ceased crossing when Germany went to war; Italian ships in 1940.

More detailed data covered the fiscal year 1940, which ended with June 30. The following figures deal with fiscal years. Crossings made by commercial vessels of at least 300 net tons (Panama Canal measurement) numbered 5370 for 1940 (5903 for 1939); in this group the individual vessels that made the crossings numbered 1613 and averaged about  $3\frac{1}{2}$  crossings for 1940 (1609 vessels averaging about  $3\frac{1}{2}$  crossings for 1939). Other crossings that paid tolls were made by non-cargo vessels of foreign governments—23 by naval ships, of which 17 British, one by a dredge of the Soviet Government; and 973 by vessels of under 300 tons, commercial and other. Crossings free of toll in 1940 included 255 by vessels of the U.S. Navy, 294 by those of the U.S. Army, 24 by others of the U.S. Government, 6 by those of the Colombian government, and 22 by vessels proceeding only to undergo repairs.

Tons of cargo crossing in the commercial ships of 300 or more tons totaled 27,299,016 for the fiscal year 1940 (27,866,627 for 1939); but in net tonnage, as measured under the rules of the Canal, the totals were much lower, being only 24,144,366 for 1940 (as against 27,170,007 for 1939). The collections of tolls, exclusive of some thousands on vessels under 300 tons, amounted to \$21,144,675 for 1940, a sharp drop from 1939's total of \$23,661,021. Net revenue from operation was \$11,253,773 for 1940, \$13,841,071 for 1939.

Data on the movement of freight through the canal in the fiscal year 1940 showed divers effects that the European war had on trade. The westward-bound (Atlantic-to-Pacific) part of the freight crossing the Isthmus rose to 9,819,600 long tons for the fiscal year 1940, from 9,011,267 for 1939. The eastward-bound (Pacific-to-Atlantic) part diminished to 17,479,416 for 1940, from 18,855,360 for 1939. In general, trade via the canal to or from Europe fell off and that to or from the United States, via the canal, except with Europe, increased. By conspicuous instances, U.S. inter-coastal trade increased to 2,795,708 tons (1940) westward bound, from 2,391,523 (1939), and to 4,918,629 tons (1940) eastward bound, from 4,493,203 (1939). U.S. Atlantic coast's trade with the Far East, exclusive of the Philippines, rose to 2,888,160 tons (1940) westward bound, from 2,593,808 (1939), and to 585,304 (1940) eastward bound, from 280,593 (1939). Between the U.S. Atlantic coast and the South American Pacific coast, trade augmented to 501,511 tons (1940) westward, from 192,732 (1939), and to 2,757,412 tons eastward (1940) from 2,447,257 (1939). On the other hand, between Europe and Pacific South America, shipments fell to 259,700 tons westward (1940), from 415,697 (1939) and to 1,474,874 eastward (1940) from 2,481,541 (1939). Between Europe and the Pacific coast of the United States, movement dropped to 192,374 tons westward (1940) from 337,401 (1939), and to 1,099,296 tons eastward (1940) from 2,349,888 (1939).

By tons of cargo, U.S. shipping through the canal increased to 12,384,617 for 1940, from 9,909,380 for 1939, and attained 45.4 per cent of all ton-

HENRY A WALLACE IN MEXICO CITY

nage of cargo passing through in 1940. The tonnage of British cargo dropped to 5,182,351 (1940) from 6,801,556 (1939); that of Norway to 2,905,772 (1940) from 3,408,078 (1939). That of Japan rose to 1,863,619 (1940) from 1,710,303 (1939). With regard to all the preceding figures on tonnage, however, it must be borne in mind that totals of the bulk of freight should not be confused with totals of commerce, having to do with value.

**Work on Additional Locks.** The U.S. Congress voted in 1940 authorization of \$99,000,000 in contracts for the construction of a third set of locks in the canal; it also appropriated \$15,000,000 for the initial costs of the undertaking. Contractors' bids were obtained in December for work to be done on the first stages of the project. The time set by engineers for the accomplishment of the necessary work was six years, according to original estimates. It was furthermore reported that the Government intended to reserve the third set of locks, when completed, for the sole use of its own vessels: this course might be expected to preserve the third set from obstruction through treachery.

**Administration.** The administration of the Panama Canal is that also of the Panama Canal Zone.

**PANAMA CANAL ZONE.** A strip of territory extending, in general, five miles to either side of the Panama Canal, across the Isthmus of Panama. The area also includes extensions into parts of the watershed feeding the canal and extends as far as the farthest borders of Gatun Lake, the chief reservoir. The United States has perpetual use, control, and occupation of the Zone, as granted by the Republic of Panama in a treaty of 1903. Area, 552.95 square miles; includes water, 190.94 square miles.

The population, exclusive of officers and enlisted members of the U.S. Army and Navy, was 28,978 in June, 1939. On Apr. 1, 1940, the total population (without the foregoing specified exclusion), was 51,827 (U.S. Census). Employees of the Panama Canal and of the Panama Railroad Company numbered 24,149 but did not all live within the Zone. The death rate among the Zone's inhabitants (many of whom eventually departed by reason of retirement and not of death) was 6.32 per 1000 for 1939; birth rate, 10.76. Sufferers from malaria among the civil employees came to 14 per 1000, but none had died of the disease in seven years. None of the sicknesses requiring to be excluded by quarantine entered the zone in the fiscal year 1940, nor did the inspection of arrivals and the quarantine of a few suspected cases reveal any actual arrival of contagious persons. The separate white and colored public schools had respectively, in 1940, an average attendance of 2798 and 2686 pupils.

**Government.** The Panama Canal Zone has a civil government, prescribed by the U.S. Congress in the Panama Canal Act of 1912, subsequently modified. It is also the seat of a Department of the U.S. Regular Army. The civil government is headed by the Governor of the Panama Canal, an appointee of the President; and it is under the supervision of the Secretary of War. The Governor operates and maintains the canal itself, with its auxiliary services; is president ex officio of the Panama Railroad Company; and holds authority to maintain law and order, health, and education and to deal with related matters, among the inhabitants. The Military Commander of the Panama Department (U.S.A.) has normally to do only with the military forces; but on Sept. 25, 1939, an executive order of the President put the Gov-

ernor, canal, and Canal Zone temporarily under the direction of the Military Commander. In 1940 the Governor was Brig. Gen. C. S. Ridley, (until the end of June), succeeded by Col. (later Brig. Gen.) Glen E. Edgerton. Military Commander, Maj. Gen. Daniel Van Voorhis.

**History.** The start of the great task of giving the Panama Canal a third system of locks is discussed under PANAMA CANAL.

The Army's forces defending the zone were reorganized in February on the lately approved basis of functional distinctions among the troops. Uneasiness over suspected activities of agents of anti-democratic belligerent governments continued. According to a report current in June, several hundred Germans and Austrians were supposedly among the persons employed in the zone. A man giving the name of Emil Wolff, on his way from Germany via the Pacific Ocean and the Panama Canal, ostensibly to work for a drug firm in Buenos Aires, was taken from a Japanese vessel, with a trunk containing German official matter not disclosed. He pleaded guilty of failure to comply with the U.S. requirements as to agents of foreign governments. The U.S. District Court in the zone fined him \$2000 and imposed, but suspended, a sentence to prison.

The problem of dealing with possible disturbers was to have been lightened by a measure in Congress, to restrict skilled and other superior employment in the zone to citizens of the United States. But in view of the provisions of the U.S. treaty of 1936 with the Republic of Panama, the President, in March, found it proper to intimate objection to the bill. Late in May, several political fugitives from the Republic of Panama, having entered the zone, were arrested. General Van Voorhis issued (May 27) a ruling that such refugees, in order to avoid arrest, must register with the police of the zone. A few days later, June 4, he urged the Panamanian refugees to depart. By executive order the President, June 20, gave the Governor of the zone authority to exclude, as undesirable, persons engaging in or inciting a strike against the U.S. Government. An Army transport conveyed 134 aliens from the zone to New York in September. In spite of efforts against disturbers, a brief strike of possibly 1000 unorganized unskilled workers started on September 5. Most of the strikers went back to work on the 9th, upon warning that otherwise they would be discharged.

**PAN AMERICAN AIRWAYS.** See AERONAUTICS.

**PAN AMERICAN HIGHWAY.** See AUTOMOBILES.

**PAN AMERICANISM.** The Pan American movement, after many years of pioneering, offered in 1940 many well-explored methods for the common action of American nations, as they came to face a mass of economic and political difficulties brought upon them by the war in Europe. Some of these troubles had begun in 1939, when the operations of the German warship *Graf Spee* and her pursuers brought warfare almost to the harbor of Montevideo. As the war went on, the trade of the American countries almost universally suffered from the impossibility of dealing with the European continent and the great restriction of commerce with Great Britain. Agents of Germany, bent on disturbing governments aligned with Great Britain by business interest, created alarm and, in the case of Uruguay (q.v.), came somewhat near to maturing a plot for overthrowing the government. Interruption of economic activity introduced

new risk of social upheaval in a number of the greater Latin American republics. The situation heightened the influence of the United States; and the U.S. Government took the opportunity to offer economic aid and to further a united public policy among its neighbors, as to defense of territory, the safeguarding of European nations' American colonies from conquest, and the protection of the American countries' economic and social systems.

The year's foremost event in the Pan American field was the Havana Conference, which dealt with

many of the common problems and, in particular, drew up measures for action to prevent European colonies in the Americas from falling into conquerors' hands. The Inter-American Financial and Economic Advisory Committee, established late in 1939, in accordance with a resolution of the Panama Conference, carried out or advanced the chief matters put in its hands by that conference and its successor the Havana Conference of 1940. Its earliest effort, the preparation of a plan for an Inter-American Bank, was followed by the crea-

tion of the Inter-American Development Commission, a permanent agency for promoting trade and industry, and by the settlement of difficulties over the quotas of coffee-producing American countries' future sales of coffee to the United States. Later, the Commission brought about a maritime conference of the American nations (November 25 to December 2).

**Havana Conference.** The U.S. Department of State convoked in June a conference of the Foreign Ministers of the governments of the American countries. Its immediate predecessor, the Panama Conference, had met in September, 1939, just after the start of the European war (see *YEAR BOOK*, 1939, p. 595). The new conference met at Havana on July 21 and continued until July 30. It followed closely upon the German victory over western Europe; yet more closely, upon President Roosevelt's announcement, June 21, of an intended "system of joint marketing of the important staple products of the American republics," to constitute part of a "program of economic defense." The proposed agenda included not only possible measures of economic co-operation but steps to be taken if European possessions in the Western Hemisphere should be lost or impaired and such other defensive preparations as might seem prudent.

The Havana Conference provided against the transfer of any possession in the Western Hemisphere from one non-American sovereignty to another. This was accomplished by the adoption of two measures: the one, submitting to the American republics, for ratification, a convention providing for action against such occurrence; the other, the Act of Havana, which made provisional safeguards to the same purpose, for such time as might precede the necessary ratifications of the convention.

The Havana Convention required that any such possession, in case another non-American power should attempt to acquire or control it, should pass under the administration of one or more of the American governments. It created an Inter-American Commission for Territorial Administration having power to authorize such an administration. It required ratification by two-thirds of the American Republics to render it effective. The substantive part of the text was as follows:

If a non-American state shall directly or indirectly attempt to replace another non-American state in the sovereignty or control which it exercised over any territory located in the Americas, thus threatening the peace of the continent, such territory shall automatically come under the provisions of this convention and shall be submitted to a provisional administrative regime.

The administration shall be exercised, as may be considered advisable in each case, by one or more American states, with their previous approval.

The Act of Havana declared that regions in the Americas, when in danger of passing from one non-American sovereignty to another, might be placed by the American nations under a provisional administration. It created an emergency committee (of one member from each American republic), authorized to administer any such region until the Havana Convention should come into effect. But in case of pressing need, it allowed any of the American republics to act in such manner as individual defense and that of the continent might require, reporting thereon to the committee. This act was to serve only until the convention's coming into effect.

In dealing with the Americas' economic troubles the Havana Conference did not generate any full, detailed system of common policy to mend them. Nor did the United States press the economic pro-

gram outlined in President Roosevelt's announcement of June 21. On the contrary, Secretary of State Hull, in his speech at the outset of the conference declared that his government would try to effect the completion of steps already in progress before starting to deal with monetary and exchange matters and that "a broader system of inter-American co-operative organization in trade" would meanwhile remain under consideration. The idea of a Pan American marketing organization or cartel did not crystallize at Havana. The conference did adopt a resolution on economic and financial co-operation. This resolution laid down liberal principles for trade, envisaging its eventual resumption with the entire world (an implied denial of intent to blacklist Germany). It strengthened the authority and broadened the field of the Inter-American Financial and Economic Advisory Committee; and instructed this committee to perform several tasks, notably, to provide storing, financing, handling, and equitable terms of trade for the countries' surplus of commodities.

As to good relations among the American governments, the conference resolved to recommend to the governing board of the Pan-American Union the creation of a committee of representatives of five countries, for noting and helping to solve disputes. Hostile acts in territorial waters and in the marine zone of security proclaimed by the Panama Conference were condemned, but no particular sanctions against them were adopted. Governments were urged to "use the necessary means" to prevent plots of civil war, disturbance, or dissemination of subversive ideas in neighboring countries.

As to an existing dispute between Chile (q.v.) and Spain, the conference declared "sympathy and fraternal solidarity" with Chile's attitude. As to current signs of German plots against some of the republics, a resolution declared that each of the American republics "shall adopt within its territory all necessary measures in accordance with its constitutional powers" against foreign efforts to subvert the domestic institutions.

**Emergency Committee.** The Emergency Committee provided by the Act of Havana as the agent in case of the impairment of a foreign sovereignty in an American possession became effective on October 24, two-thirds of the republics having named members to it. The recent entry of British forces in the Netherland West Indies might have been interpreted as a case within its province, under the very general terms of its mandate. But the committee obviously followed its judgment that the British occupation tended to preserve rather than impair the sovereignty of the Netherland government in exile, and took no action.

**Neutrality.** Great Britain replied, January 16, to the American republics' protest of 1939 against violation of marine zone of security that the Panama Conference had declared. The reply was deemed a refusal to keep the restrictions set up for the zone, for Britain agreed to conform only if German activity in the zone were restricted to an impracticable extent. There followed, on March 16, a further protest to Great Britain, dispatched by the President of Panama on behalf of all the American republics. It declared that a British warship's sinking of the German freighter *Wakama* off the Brazilian coast on February 12 had violated the zone. Again, on May 24, a similar protest followed a British warship's interception of the German ship *Hannover* off the coast of the Dominican Republic.

Other belligerents replied to the 1939 Pan American protest. France (January 23) asserted the right to take counter-measures in the zone, as the German navy had not respected it. Germany (February 14) held that the zone made a sanctuary of the British and French territories in the New World and that Britain and France had already rejected the idea of the zone. The Inter-American Neutrality Committee showed some disposition to seek fuller authorization for dealing with the maintenance of the Declaration of Panama. It proposed a plan for shutting out of American ports any ships transgressing the restrictions of the security zone and in some cases also excluding all ships of the transgressing nation. The proposal was not adopted.

**Inter-American Bank.** Progress toward the establishment of an Inter-American Bank was one of the most notable steps on the way to full economic linking of the republics. The Inter-American Financial Economic Advisory Committee, which started to operate on Nov. 2, 1939, made the creation of this bank its first task. Shares, at \$100,000 each, were allotted to each republic, in number proportional to its part of the combined republics' foreign commerce. By May 10 five governments, the United States included, had signed a convention for the establishment of the bank, rendering the convention effective. It remained to have the signatures ratified and to incorporate the bank by act of the U.S. Congress. In the meantime, the United States gave extensive credit to some of the other republics through the Export-Import Bank.

See ARGENTINA, BRAZIL, BRITISH WEST INDIES, CHILE, COLOMBIA, CUBA, CURAÇAO, ECUADOR, PERU, MARTINIQUE, MEXICO, URUGUAY, and the other American republics and colonies under *History*; also NATIONAL DEFENSE ADVISORY COMMISSION; EDUCATION; INTER-AMERICAN UNION OF THE CARIBBEAN; PAN AMERICAN UNION.

**PAN AMERICAN UNION.** The Pan American Union is an official international organization founded in 1890 as the International Bureau of American Republics and maintained by the 21 republics of the Western Hemisphere for the development among them of good understanding, friendly intercourse, commerce, and peace. It is controlled by a Governing Board, composed of the Secretary of State of the United States and the diplomatic representatives in Washington of the other republics, and is administered by a Director General and an Assistant Director chosen by the Board.

The Union publishes a monthly Bulletin which is issued in three editions, English, Spanish, and Portuguese, as well as numerous special reports on the countries which are members of the Union. These are widely distributed in all the republics of the American continent and are intended to make available information on the various aspects of inter-American activity.

The Pan American Union acts as the permanent organ of the International Conferences of American States which meet at intervals of five years. The last or Eighth of these Conferences was held at Lima, Peru, Dec. 9-27, 1938. The program and regulations of each Conference are prepared by the Governing Board of the Union, and in the interval between the Conferences the organization is engaged in giving effect to the resolutions adopted and also co-operates in securing the ratification of the treaties and conventions signed at each Conference.

The Lima Conference resulted in a considerable

enlargement of the duties and responsibilities of the Pan American Union which during 1940 was engaged in giving effect to the conclusions adopted at the Conference. A new Division of Labor and Social Information was organized which began to function on Jan. 1, 1940, and the scope of other administrative divisions was broadened.

Apr. 14, 1940, marked the 50th anniversary of the founding of the Pan American Union, an occasion which was observed throughout the American Continent with appropriate ceremonies. At Washington a special session of the Governing Board of the Pan American Union was held at which President Roosevelt delivered the principal address. At the meeting of the Governing Board held on Nov. 6, 1940, the Secretary of State of the United States was re-elected Chairman of the Board for the ensuing year. Francisco Castillo Nájera, Ambassador of Mexico, was at the same time elected Vice Chairman to succeed Hector David Castro, Minister of El Salvador. Headquarters of the Union are at the Pan American Building, Washington, D.C.; L. S. Rowe, Director General; Pedro de Alba, Assistant Director. See PAN AMERICANISM; STAMP COLLECTING.

**PANTELLARIA.** An Italian island (32 sq. mi.; pop., 9082) in the Mediterranean 45 miles from the coast of Tunisia and 62 miles from the Sicilian coast. Strategically situated to dominate the shipping route between the eastern and western Mediterranean, it was fortified by Italy during the crisis of 1935-37 in Anglo-Italian relations. The island has two small ports and is said to be equipped for use as an auxiliary air and submarine base (see map, 1938 YEAR BOOK, p. 360).

**PAPER AND PULP.** Paper production for 1940 reached an all-time record of 14,372,000 tons, an increase of 6.5 per cent over 1939. The production ratio of leading mills averaged 87.6 per cent, compared with 84.9 per cent for 1939. The average operating ratio of paper board mills was 71.0 per cent, compared with 70.0 per cent for 1939.

The European war increased the demand for paper and paper products to a substantial extent and the inability of European paper and pulp manufacturers to supply non-producing countries resulted in an acute shortage of paper, particularly newsprint, in international trade. The United States and Canada were called upon to supply the deficiency. As a result production of paper and pulp in the United States and Canada steadily increased.

Newsprint production in the United States totaled 1,013,437 tons, an increase of 7.9 per cent over 1939. Canada produced 3,418,803 tons, an increase of 19.2 per cent, and Newfoundland 352,585 tons, an increase of 14.5 per cent over 1939. Prices remained stable at \$50 per ton. Paper imports were more than 2,345,000 tons and exports over 505,000 tons.

Wood pulp production of all grades in the United States totaled 9,007,000 tons, which is the highest annual production on record. Wood pulp imports for 1940 totaled 1,218,070 tons, of which 828,046 tons came from Canada; Sweden supplied 279,022 tons; Finland 87,134 tons; Norway 17,190 tons; Estonia 3579 tons; Rumania 3089 tons, and France 10 tons. United States exports approximated 480,000 tons. Pulpwood imports aggregated 1,065,695 cords.

Prices during 1940 fluctuated to a substantial degree. The price level on Dec. 30, 1940, compared with Dec. 30, 1939, showed the following changes in the most important raw, semi-finished, and finished materials: Average price of the major grades

of wood pulp, excepting groundwood pulp, advanced 40.3 per cent; raw paper, excepting newsprint and paper board, advanced 9.1 per cent; chip and news board declined 7.1 per cent. Ten important paper-making chemicals showed an average advance of 5.0 per cent. No important advances and some small declines occurred in paper-making rags, but gunny advanced 8.1 per cent, Manila rope 8.0 per cent, and No. 1 mixed paper declined 9.0 per cent. See *CHEMISTRY, INDUSTRIAL; ELECTRICAL INDUSTRIES under Electric Drive; TEXAS.*

STILLMAN TAYLOR.

**PAPUA.** See *AUSTRALIA under Overseas Territory*

**PARACHUTE TROOPS.** See *MILITARY PROGRESS.*

**PARAGUAY.** An inland republic of South America. Capital, Asunción.

**Area and Population.** Area, about 169,266 square miles (61,647 square miles east of the Paraguay River, and about 107,619 square miles west of the river confirmed to Paraguay by the arbitral award of Oct. 10, 1938 which ended the Bolivian-Paraguayan dispute over the Chaco Boreal). The estimated population on Dec. 31, 1939, was 1,000,000 including about 32,000 Paraguayans, 4000 Mennonite farmers, and 8000 aborigines in the Chaco. With the exception of the small white ruling class, the people are of mixed Spanish and Guaraní Indian blood. Spanish and Guaraní are the spoken languages; Spanish the language of government, commerce, and education. The estimated population of Asunción on Dec. 31, 1939, was 104,819; of other cities in 1934. Villarrica, 35,760; Itá, 30,252; Capiatá, 19,923.

**Education and Religion.** There is widespread illiteracy. In 1937 there were 139,466 pupils in 1742 primary schools, 2034 in secondary schools, and 350 students in the National University. Roman Catholicism is the State religion. Freedom of worship is guaranteed other faiths.

**Defense.** Paraguay on Nov. 1, 1940, had an active army of about 6000, an air force of 170, and a trained reserve of 80,000 (mostly veterans of the Chaco War). The navy consisted of two armored gunboats and two other armed river boats.

**Production.** Yields of the chief crops in 1937-38 were (in metric tons): Cotton, 41,180; yerba maté, 14,415; tobacco, 3620; corn, 69,247; manioc, 502,530; beans, 22,193; sugar cane, 289,900; peanuts, 16,908; sweet potatoes, 103,248; rice, 9386; bananas, 6,703,004 stems. On Dec. 31, 1939, there were 3,506,727 cattle, 205,501 horses, and 195,264 sheep. Production of industrialized agricultural and forest products in 1938 was (in metric tons): Quebracho extract, 35,242; sugar, 7620; petit-grain oil, 110; cotton fiber, 12,478; wheat flour, 514; and of other products (in liters, equal to 0.264 U.S. gal.): Alcohol, pure, 376,464; alcohol, denatured, 91,103; castor oil, 18,949; wines, 360,000; peanut oil, 11,270; coconut oil, 561,630; cottonseed oil, 3,147,444. Cheap textiles, shoes, leather goods, soap, furniture, matches, cigarettes, foodstuffs, etc., are manufactured for domestic consumption.

**Foreign Trade.** Imports in 1939 were 12,603,834 gold pesos (13,082,101 in 1938); exports, 13,163,516 (12,017,228 in 1938). Value of leading 1939 exports (in gold pesos): Quebracho extract, 3,321,468; canned meat, 1,799,990; cattle hides, 1,637,724; yerba maté, 1,311,583; meat extract, 1,167,680. For distribution of trade by countries in 1938, see 1939 *YEAR BOOK*.

**Finance.** The Minister of Finance on Feb. 26,

1940, announced an accumulated budget deficit of 300,000,000 gold pesos from the fiscal year 1935-36 to Dec. 31, 1939, inclusive. The budget for the last seven months of the 1938-39 fiscal year estimated revenues at 1,764,890 gold pesos and 1,054,688,000 paper pesos and expenditures at 1,454,000 gold and 1,231,154,000 paper pesos. On Dec. 31, 1938, the external debt was 8,715,906 gold pesos; internal debt, 20,019,087 gold pesos and 758,474,347 paper pesos (see *History*). Average exchange rate of the Paraguayan gold peso, \$0.6134 in 1939 (\$0.6866 in 1938); of paper pesos, \$0.00373 in 1939 (\$0.00426 in 1938). Par value of the gold peso, \$1.63.

**Transportation.** Railways in 1940 extended 713 miles, all privately owned. Air lines connect Asunción with Buenos Aires, Rio de Janeiro and Santos. Asunción, 950 miles from the sea, is accessible to river vessels of 12 foot draft at all times of the year; in 1937 4503 steamers of 251,331 tons entered the port. A 100-mile highway from Asunción to Villarrica was under construction by American engineers in 1940. Roads of all types extended 3759 miles, of which only about 30 miles were improved with gravel surface.

**Government.** A state of siege, or modified martial law, was in effect in Paraguay almost continuously from the outbreak of the Chaco War in 1932 through 1940. The Constitution of 1870 was suspended following the successful military revolt of Feb. 17, 1936. A Congress of 20 Senators and 40 Deputies, elected Sept. 25, 1938, was composed exclusively of Liberals as the opposition National Republican (Colorado) party boycotted the polls. On Apr. 30, 1939, Gen. José Félix Estigarribia (Liberal) was elected President, with the Colorado party again refusing to vote. He assumed office Aug. 15, 1939. For developments in 1940, see *History*.

## HISTORY

**Dictatorship Established.** The efforts made by President Estigarribia to restore orderly, constitutional government encountered unexpected difficulties early in 1940 and on February 18 he assumed dictatorial powers. The two primary factors influencing his decision were the outbreak of student disorders and his failure to obtain the cooperation of the Colorado party, which had refused to participate in elections since 1931.

The President's negotiations with the Colorados appeared to be nearing success in the first weeks of the year. A tentative agreement was reached under which the Liberal Congress would resign, the state of siege would be ended, and new Congressional elections held with both parties competing. Ratification of this accord was delayed by dissension within the Liberal party between a youthful faction of Estigarribia supporters and old-line Liberals led by ex-President José P. Guggiari and Geronimo Zubizarreta (see *YEAR BOOK*, 1938, p. 132).

Meanwhile the government became involved in controversy with students at the National University. The Minister of Justice and Education, Efraim Cardozo, banned a meeting of students who sympathized with bitter attacks made upon the Minister of Foreign Affairs, Justo Prieto, by the pro-Fascist newspaper *El Tiempo*. When the governing council of the autonomous university censured Dr. Cardozo for this action, President Estigarribia intervened and with Congressional assent placed the university under the Minister of Education's direct supervision. A number of prominent members of the faculty were dismissed and

Congress voted funds to hire foreign professors to replace them. The students then started a strike that spread to the secondary schools and commenced distribution of handbills calling for the overthrow of the government. The government retaliated by arresting student leaders and segregating them in small towns near the Brazilian border.

The time limit set for state of siege expired on February 15, with the student strike still under way. In view of this situation, President Estigarribia obtained from Congress a law restricting the rights of assembly and free speech. The Colorado party then announced that because of this law and the government's intervention in the National University it had decided not to participate in the elections. On February 16 the cabinet resigned to give the President a free hand in meeting the political crisis. He appointed a new ministry of nine instead of seven members. Congress then met in extraordinary session on February 17 and resigned collectively after authorizing the convening of a Constituent Assembly one year later to draft a new Constitution. The law barred any change in Article I of the 1870 Constitution which provided that the government must be democratic and representative in form.

On the following day President Estigarribia in a radio address to the nation announced that he had assumed dictatorial powers to check "anarchy and social decomposition." He called for a new form of democracy, based on collective co-operation, that would be social and economic as well as political in its application. Once anarchy had been ended and the people had demonstrated their fitness to rule themselves, he promised to call elections for a Constituent Assembly. In the meantime, all political activities were banned. These measures and the elimination of Dr. Cardozo from the cabinet soon calmed the political atmosphere.

**The New Constitution.** On February 18 a committee of university professors headed by Dr. Cecilio Báez, rector of the National University, was appointed to draft a new Constitution. Its work was completed July 9 and on July 10 the new organic law was signed by President Estigarribia. Instead of submitting the Constitution to a freely elected Constituent Assembly, as originally planned, the President called a national plebiscite, held August 4, at which the document was approved by a vote of 163,628 to 13,521. It was promulgated on August 15, when the President, the cabinet, and other high government officials swore to observe it.

The Constitution vested executive power in a President, a State Council representing economic groups on a corporative basis, and a cabinet. A unicameral Congress was given legislative authority. President and Congress were to be elected for four-year terms by compulsory, secret suffrage. Women received the right to vote along with other civil rights. President Estigarribia's term was to expire Aug. 15, 1943. The Constitution guaranteed the right to work and freedom of assembly, petition, press, and association. Congress was forbidden to grant special powers to the President but the government was authorized to limit constitutional liberties if necessary to the preservation of order. It was also empowered to regulate economic life and control all labor contracts to prevent the "exploitation of man by man." Class war, price-fixing and monopoly were outlawed and the priority of individual rights over public interest was ended. The right of private property was guaranteed in limited form, but it was stipulated that

every home should stand on land owned by the occupant. In other respects the Constitution embodied the fundamental principles of the Constitution of 1870.

**Death of President.** Three weeks after the Constitution was promulgated, President Estigarribia and his wife were killed in an airplane crash. They were buried in the National Pantheon. The government raised General Estigarribia posthumously to the rank of marshal and named the new Asunción-Villarrica highway in honor of the commander who led Paraguay to victory in the Chaco War. On September 7 the cabinet designated the Minister of War, Gen. Higinio Morinigo, as Provisional President pending election of a successor to Estigarribia.

**Morinigo Becomes Dictator.** Although the Provisional President promised early elections to select a new President, he proceeded step by step to transform his regime into a personal dictatorship. Commencing with the cabinet reorganization of September 30, supporters of Estigarribia's liberal policies were forced out and replaced by army officers and civilians described as reactionary. Col. Ramón Paredes, appointed Minister of Interior and Labor on September 30, warned the "professional politicians" that the army would direct political affairs.

He in turn was forced out of the cabinet on November 25 when President Morinigo shook up both the ministry and the high command of the army. As the new Minister of Interior, Lt. Col. Dámaso Sosa Valdés became a key figure in the government, which relied upon the support of the younger army officers. The Provisional President on November 30 promulgated a decree establishing an absolute dictatorship. He was reported to have arrested many leaders of the long-dominant Liberal party. Travelers reaching Buenos Aires from Paraguay reported the country at the year's end in a state of virtual anarchy, but in Asunción, where strict censorship was in force, these reports were denied.

**Economic Developments.** Previous to his death President Estigarribia had pressed forward with the program of public works and economic and financial rehabilitation made possible by credits obtained from the Export-Import Bank of Washington and by economic accords with Argentina and Brazil (see YEAR BOOK, 1939, p. 599-600). The depreciation of the paper peso was checked during the latter part of 1939. On Apr. 9, 1940, a commission was established to liquidate the floating debt and a 200,000,000-peso bond issue was authorized for this purpose. On February 29 the import control system established the previous June was abolished. On May 24 the government undertook to purchase the remainder of the cotton crop from the growers and hold it until prices increased. On June 8 the mining laws were amended to make the natural resources of the country a public utility and to encourage their exploitation.

At President Estigarribia's initiative, two experts of the U.S. Tariff Commission and Federal Reserve Bank were loaned to Paraguay to reorganize the tariff system and serve as economic adviser to the Paraguayan Government, respectively. A third expert from the U.S. Bureau of Mines visited Paraguay to study the feasibility of developing its mineral resources. However the benefits derived from these measures were more than offset by the spread of the European war, depriving Paraguay of additional markets for her slender exports. In the hope of finding new trade outlets,

a commercial delegation was sent to Japan and Paraguay joined with her former enemy, Bolivia, in promoting an economic conference of the countries of the Plata River basin. The political disturbances of the last quarter had a further adverse effect upon the economic situation.

**PARI-MUTUEL BETTING.** See COLORADO; FLORIDA; NEW JERSEY; NEW YORK.

**PARKS, National.** See NATIONAL PARK SERVICE; TRAVEL BUREAU, U.S.

**PAROLE.** See PRISONS, PAROLE, AND CRIME.

**PASSPORTS.** The Passport Division of the U.S. Department of State reported that the number of passports issued and renewals granted during 1940 totaled only 26,253, as compared with 89,850 in 1939 and 134,737 in 1938. This very sharp decline indicated the extent to which foreign travel on the part of United States citizens has been hampered by war conditions.

Restrictions governing the use of passports, issued by the Secretary of State immediately after the outbreak of the war, continued in effect throughout the year. It was required that passports previously issued be submitted to the Department of State for validation for travel to any country in Europe, that documentary evidence be submitted showing the imperative necessity for such travel, and that all passports be returned to the Department of State for safe keeping upon the return of Americans from abroad. Travel on a vessel of a belligerent country was prohibited on the Atlantic Ocean north of 35 degrees north latitude and east of 66 degrees west longitude except when specifically authorized.

These restrictions were further strengthened by an executive order of Oct. 11, 1940, requiring validation of passports for travel to all countries outside of the Western Hemisphere, although it was stated that a more lenient policy would be followed in cases where travel was reasonably safe. Persons submitting passports for validation were required to state the names of the countries they intended to visit and the object of the visit in each country.

The new regulations were described as due to the increasing hazards of foreign travel and to the fact that, after Oct. 16, 1940, male citizens between the ages of 21 and 35 would be required to obtain a permit to leave the country. In connection with the order, the Department of State called attention to the President's proclamation of 1940 as "Travel America Year" with the object of increasing understanding between countries of the Western Hemisphere.

**PATENT OFFICE, U.S.** Widespread observance of the sesquicentennial of the patent system marked the year 1940. Apr. 10, 1940, was designated by President Roosevelt as "Inventors and Patent Day" to commemorate the anniversary of George Washington's approval of the first patent law on Apr. 10, 1790. In his proclamation calling for celebration of the occasion President Roosevelt described the enactment and approval of that statute as an event which "had proved important and salutary to this nation." By joint resolution the U.S. Senate and House of Representatives named a Commission to plan for the appropriate observance of the sesquicentenary. Private organizations throughout the country also sponsored commemorative exercises.

Important changes in the patent laws, enacted by Congress in 1939, became effective in 1940. Most significant of these is the statute curtailing

from two years to one year the period of publication and public use precluding the issuance of a patent. On June 30, 1940, there became effective the law transferring from the Patent Office to the Library of Congress the function of registering copyrights covering prints and labels used for articles of merchandise. In 1874 Congress assigned to the Patent Office the duty of registering such copyrights. All other copyrights continued to be registered in the Library of Congress.

On July 2, 1940, the President approved an Act of Congress amending the tariff laws so as to prohibit, under certain circumstances, the importation of products made by processes covered by United States patents.

As a part of the program of national defense, it was provided by Congress on July 1, 1940, that the Commissioner of Patents could order held in secrecy such inventions as relate to the public safety and defense, and withhold the grant of a patent when the publication or disclosure of the invention might be prejudicial.

Nine months of war in Europe, overthrowing Governments, creating economic dislocations, and hampering communication and exchange, had its reflex in the Patent Office during the fiscal year 1940. The number of applications from European countries declined below the total of recent years and there was a corresponding decrease in the fees from those sources.

In the fiscal year 1940 an aggregate of 61,425 applications for patent were filed, as against 66,166 in the preceding 12 months. The number of patents granted, including those covering reissues, designs, and plants, was 47,924, and exceeded by 451 those issued in 1939.

CONWAY P. COE.

**PEACE AIMS.** See GERMANY, GREAT BRITAIN, ITALY, JAPAN, and NEW ZEALAND under *History*.

**PEACE MOVEMENT.** See CARNEGIE ENDOWMENTS; NOBEL PRIZES; the organizations listed under SOCIETIES.

**PEACHES.** See ENTOMOLOGY, ECONOMIC.

**PEARS.** See ENTOMOLOGY, ECONOMIC.

**PEMBA.** See ZANZIBAR PROTECTORATE.

**PENANG.** See BRITISH MALAYA.

**PENNSYLVANIA.** Area, 45,126 square miles; includes water, 294 square miles (but not the State's part of the waters of Lake Erie). Population (U.S. census), April, 1940, 9,900,180; 1930, 9,631,350. Philadelphia (1940), 1,931,334; Pittsburgh, 671,659; Scranton, 140,404; Reading, 110,568; Harrisburg, the capital, 83,893. Of the State's whole gain in population (1930-40) of 268,830, the urban population (dwellers in places of 2500 or more) accounted for 53,366, while the rural population increased by 215,464. The urban total (1940) was 6,586,877; the rural, 3,313,303.

**Agriculture.** Pennsylvania harvested, in 1940, 6,211,000 acres of the principal crops. Corn, on 1,341,000 acres, grew 53,640,000 bu. (\$41,839,000 in estimated value to the farmers). Tame hay, 2,400,000 acres, 3,228,000 tons (\$32,056,000); potatoes, 189,000 acres, 24,570,000 bu. (\$16,953,000); wheat, 917,000 acres, 18,789,000 bu. (\$15,219,000); oats, 888,000 acres, 31,080,000 bu. (\$12,743,000); tobacco, 33,300 acres, 48,324,000 lb. (\$6,040,000); apples, 9,100,000 bu. (\$7,280,000); peaches, 2,356,000 bu. (\$2,238,000); barley, 155,000 acres, 4,030,000 bu. (\$2,216,000).

**Mineral Production.** Pennsylvania's yearly production of minerals native to its territory, as

stated in 1940 by the U.S. Bureau of Mines, totaled \$472,773,327 for 1938; this amount was only about four-fifths of 1937's total. Texas and California exceeded it, among the members of the Union. About seven-tenths of the total came from anthracite and bituminous coal; petroleum, natural gas, and clay products supplied most of the remainder.

Mines' production of anthracite rallied to 51,487,000 net tons (value, \$187,175,000) for 1939 and thereafter sagged somewhat again to some 49,700,000 tons for 1940, as against 46,099,027 tons (value, \$180,600,167) for 1938. The yearly-mined tonnage in all three cases lacked much of corresponding figures for former years; as an example, 73,828,000 tons had been mined in 1929. Competition from other domestic fuels, rather than any deficiency in the mines themselves, was the cause. The figures presented on anthracite failed, however, to show the subject entire: anthracite was "bootlegged" (mined by non-owners without owners' permission) on a huge scale. The State's Department of Mines, after a survey late in 1939, estimated that about 2500 bootleg operations employed 9000 men, producing 340,000 tons in a month, or around 4,000,000 tons a year; whereas figures in general covered only lawful operations, this survey implied that the generally quoted totals fell short by a possible one-twelfth of covering all production. As the bootlegger depleted other capital investment than his own, he could afford to sell at prices below the lawful operator's range, and thus further to increase his share of the industry.

The mining of bituminous coal made a substantial rally, to a yearly total of some 92,190,000 net tons (1939), from 77,704,537 tons (value, \$100,965,000) for 1938; it was further stimulated by the Federal armament program's activation of many heavy industries late in 1940, in which year the output was estimated at 112,907,000 tons.

The production of petroleum, 17,337,000 bbl. (1939), as against 17,426,000, value \$32,760,000 (1938), attained about the same level of volume for 1940. In each year all but a few thousand bbl. ranked as Pennsylvania grade, source of lubricants and priced accordingly. Natural gas produced and delivered to consumers totaled 76,574 million cu. ft. (1938); in value at points of consumption, \$29,544,000. In 1939 new wells in known fields added to the available reserve, but no new fields of apparent promise were found. Clay products (exclusive of pottery and refractories) totaled \$8,844,284 for 1938.

Apart from the data above, the great industries treating minerals wholly or largely from outside regained much ground lost after the economic slump of 1937. The production of coke mounted to 12,120,225 net tons (1939), from 7,601,433 (1938); by value, to \$49,015,558, from \$32,016,406; and in 1940 the output of largely supplanted beehive coke ovens, still available in times of extra demand, more than doubled their total of 1939. Furnaces' shipments of pig iron rose to 8,979,649 gross tons (1939), from 4,684,017 (1938); by value, to \$186,302,533, from \$101,266,844. Open-hearth steel ingots and castings likewise augmented to 12,162,743 gross tons for 1939, from 7,072,157 tons for 1938. Ferro-alloys made in 1938 amounted to \$19,624,173; in 1939, apparently to more, as the Union's output of ferro-alloys for 1939 exceeded those of 1938 by 80 per cent in value.

**Manufactures.** Pennsylvania produced the second-highest value of manufactured goods in the

Union for 1939; its yearly manufactures attained \$5,473,317,408 (1939); \$5,032,083,005 (1937). Other related totals for 1939 (each with that for 1937 in parentheses): 13,802 (13,084) establishments, employing 858,307 (954,340) wage-earners at a year's wages of \$1,003,347,730 (\$1,176,957,270), paid for materials, contract work, etc., \$2,980,948,116 (\$3,367,672,686), and added to material by manufacture the value of \$2,492,369,292 (\$2,664,410,319).

**Education.** For the academic year 1938-39 (latest covered as to data that follow), Pennsylvania's inhabitants of school age (from 5½ years to 18) were reckoned at 2,131,800. Enrollments of pupils in all public schools numbered 1,877,235; this comprised 1,166,274 in elementary study, 675,637 in high school, and 35,324 in kindergarten. Expenditure of the year for public-school education totaled \$212,590,949. The teachers in public schools numbered 63,988.

**History.** A broad gain in industrial activity, particularly through the latter half of 1940, carried away many of Pennsylvania's economic troubles. In its earlier stages this gain responded to foreign demand created by the war in Europe; later the gigantic task of building up armament, hastily undertaken by the Federal Government under the pressure of the German conquests in Western Europe piled orders on the numerous Pennsylvania manufacturers capable of handling them. As in other States having important industries for working steel and for heavy fabrications, payrolls grew phenomenally, dependence on public support diminished, and public revenues rose. The case of the Cramp shipyards at Philadelphia furnished an extreme example: they had lain idle since 1927 and owed huge sums in unpaid taxes and in defaulted interest; for the greater part of 1939-40, efforts to arrange a composition that would permit of their reopening and getting some of the increasing orders for new naval vessels had gone on without avail; but on Nov. 29, 1940, the Navy announced contracts to these yards for building six cruisers, expected to cost nearly \$114,000,000, and for restoration and expansion of the yards' facilities with \$9,000,000 or more of the Government's money. See FLOOD CONTROL.

**Legislation.** Improvement reached no such brilliant stage early in the year. The reduction in the number of recipients of the State's poor relief, in anticipation of which Governor James and the Legislature had put through a frugal budget in 1939, still lagged. As the money for poor-relief began to run low, the Governor had to summon (April 29) a special session of the Legislature to provide more; the summons also submitted several other subjects. The session convened May 6, adjourned May 16. It granted \$71,850,000 for additional expenditure on poor-relief; by transferring sums from previous appropriations for other purposes it found a temporary escape from need to impose additional taxation, and thus made good the Governor's promise to manage without adding to the load of taxes that the Earle administration had left. Another enactment permitted the extension of the great east-west "superhighway," the Pennsylvania Turnpike—then about completed in its original extent—all the way into Philadelphia; the Legislature did not deal with the means for getting the \$75,000,000 that this extension was expected to cost. (See ROADS AND STREETS.)

**Administration and Courts.** In order to hasten the return of the destitute to regular employment and get them off the relief rolls, the Secretary of

Assistance undertook, in June, the task of purging the rolls; this involved finding among some 500,000 dependents on the State's support the men able to work and notifying them to cease relying on public support. Earlier, the State had prevailed on the WPA to relieve it of 5000 clients (February 1) thus raising the number paid by the WPA in the State to about 165,000. In the effort to put the self-supporting but law-breaking "coal bootleggers" in the anthracite fields on a lawful basis the Governor urged upon the mining companies a plan for giving the illicit miners a status as lessees. Dealing with the possible risk of seditious plots, the State detailed an officer of the National Guard to compile communicated information on the subject; the registration of aliens was required, and there followed litigation in the U.S. Supreme Court, in which the U.S. Solicitor General intervened to ask a decision against a State's right to register its alien population (December 6).

Former Democratic State Chairman David L. Lawrence and Ralph M. Bashore, both formerly high in the Earle administration, were tried at Harrisburg, with several others, on charges of conspiracy to compel political contributions from State employees; all were acquitted (April 12). The U.S. Supreme Court held (June 3) that a Pennsylvania school board could compel a pupil to salute the American flag, despite pupil's conscientious objection. The State Supreme Court granted a new trial to Herman Petrillo, former head of a Philadelphia "arsenic ring," on the ground of faulty procedure in the original trial; he was again convicted and (October 2) condemned to death.

**Philadelphia.** Mayor Robert E. Lamberton took office on January 1. He declared his intention to carry out a program for augmenting the municipal water system and completing the system for the disposal of sewage, in about 2½ years, at an outlay of \$60,000,000. The City Council authorized (March 7) an initial loan, for repairs to the water system, of \$18,000,000. The municipal tax of 1½ per cent on incomes, on which the local government relied for keeping clear of further deficits in current operations, was declared valid by the State Supreme Court at the beginning of February.

Having come through a protracted reorganization, Philadelphia's system of street railways and buses, under the name, Philadelphia Transportation Company, arranged early in the year to add to its equipment by substantial purchases of buses, trolley cars, and trackless trolleys.

**Elections.** At the general election (November 5) the popular vote for President totaled 2,171,035 for Roosevelt (Dem.) and 1,889,848 for Willkie (Rep.). U.S. Senator Joseph F. Guffey (Dem.) was re-elected, defeating Jay Cooke (Rep.). In the vote for State officers the Democrats took minor State offices and regained a majority in the State House of Representatives, lost in 1938; the State Senate remained heavily Republican. Nineteen Democratic U.S. Representatives were elected: a gain of 4, reducing Republican seats to 15. There was no election of Governor.

**Officers.** Pennsylvania's chief officers, serving in 1940, were: Governor, Arthur H. James (Rep.); Lieutenant Governor, Samuel S. Lewis; Secretary of Internal Affairs, William S. Livenood, Jr.; Secretary of the Commonwealth, Sophia M. R. O'Hara; Auditor General, Warren R. Roberts; Treasurer, F. Clair Ross; Attorney

General, Claude T. Reno; Superintendent of Public Instruction, Francis B. Haas.

**PERMANENT COURT OF INTERNATIONAL JUSTICE.** See WORLD COURT.

**PERSIA.** See IRAN.

**PERSONNEL ADMINISTRATION, COUNCIL OF.** See CIVIL SERVICE COMMISSION, U.S.

**PERU.** A republic on the west coast of South America. Capital, Lima.

**Area and Population.** Area, variously estimated at from 430,000 to 482,100 square miles, excluding more than 100,000 square miles in dispute between Peru and Ecuador. Estimated population in 1939, 7,500,000. With the exception of about 600,000 whites, 30,000 Japanese, and a few other Asiatics, the inhabitants are of Indian and mixed Indian and white blood. Foreigners in 1940 included about 7000 Italians, 3000 Germans, and 1489 U.S. citizens. Populations of the chief cities (est., 1936): Lima, 370,000; Callao, 75,000; Arequipa, 46,000; Cusco, 40,000; Iquitos, 40,000.

**Defense.** Military service is compulsory, but the number of conscripts is limited. As of Nov. 1, 1940, the active army numbered 14,550, the active air force 1935, and trained army reserves about 32,000, besides 8000 men in the police and gendarmerie. The navy comprised 2 obsolete cruisers, 2 destroyers, 1 torpedo boat, 4 submarines, 7 river gunboats, and 3 auxiliary craft. The army is French-trained. On July 31, 1940, Peru renewed the contract of the U.S. naval mission and arranged for a U.S. aviation mission to replace Italian instructors.

**Education and Religion.** About half the population is illiterate. Education statistics for 1937 showed 4697 primary schools with 471,304 pupils, 147 secondary schools with about 22,474 students, 7 normal schools with 649 students, 26 vocational schools, and 5 universities, with some 4500 students. The Roman Catholic Church is protected by the State and only Roman Catholic religious instruction is permitted in State and private schools.

**Production.** Agriculture supports 85 per cent of the population. Stock raising and mining are other leading occupations. Mineral products accounted for 59.6 per cent of all 1939 exports; agricultural, 33 per cent; animal, 5.7 per cent. Yields of the chief crops were (in metric tons): Cotton, 89,658 in 1939; cane sugar, 394,000 in 1939-40; wheat, 103,100 in 1938; rice, 90,700 in 1937; coffee exports, 3400 in 1939, cotton seed, 141,400 in 1938. The 1938 wool clip was 9400 metric tons. The chief mineral products in 1939 were (in metric tons): Petroleum, 1,796,000; coal, 148,000; copper ore (metal content), 35,500; lead ore (metal content), 45,000; zinc ore exports (metal content), 17,000; tungsten, 159; antimony ore (metal content), 1688; molybdenum ore (metal content), 180; silver, 584.8. Gold production in 1939 was 8471 kilograms; guano collections, 152,788 tons. The chief manufacturing lines are oil refining, and the making of cotton textiles, knit goods, hats, food products, beverages, leather, shoes, etc.

**Foreign Trade.** Including specie, imports in 1939 totaled 255,787,376 soles (260,158,735 in 1938); exports, 381,421,389 soles (342,128,640). The value of leading exports (in soles) was: Cotton, 75,191,000; copper bars, 67,462,000; crude petroleum, 56,530,000; petroleum derivatives, 54,327,000; sugar, 41,020,000; wool, 14,430,000; gold bars, 13,706,000; mineral concentrates, 13,550,000. Chief imports: Machinery and vehicles, textiles, metals and products, foodstuffs, chemicals, etc. Of the 1939 imports the United States supplied 41.1 per cent (34.3 in 1938); Germany, 14.7 (20.3); Great Britain, 8.4 (10.1). Of the 1939 exports, 30.4 went to the United States (26.8 in 1938); Great Britain, 19.6 (20.0); Germany, 6.0 (10.6).

**Finance.** Budget revenues and expenditures for 1940 were estimated to balance at 216,000,000 soles, including 28,000,000 soles of revenues and expenditures under special laws introduced for the first time; for 1941, 278,375,000 soles. Actual returns for 1939 were: Total receipts, 179,935,000 soles; expenditures, 184,878,000 soles.

The public debt on Dec. 31, 1939, was 833,110,266 soles (external funded, 506,123,276; internal funded, 85,301,761; floating and short-term, 241,685,229), or an increase of 54,810,095 soles from Dec. 31, 1938 (see *History*). Average exchange rate of the sol, \$0.1875 in 1939 and \$0.1588 in 1940.

**Transportation.** As of Jan. 1, 1940, Peru had about 2760 miles of railway line (over 600 miles state-owned); 16,361 miles of highways, of which 1696 miles were completed since 1937; and five commercial air systems, which in 1939 flew a total of 1,910,430 miles, carrying 29,360 passengers, 559 tons of express, and 26,833 lb of mail. A total of 10,453 ships of 16,469,922 tons entered Peruvian ports during 1938.

**Government.** The Constitution of Apr. 9, 1933, as amended by the plebiscite of June 18, 1939, vested executive power in a President elected for six years and ineligible for re-election. Legislative authority was vested in a Senate of 40 and a Chamber of Deputies of 140 members, all elected for six years. The suffrage in national elections is restricted to literate males of 21 years and over. President in 1940, Dr. Manuel Prado y Ugarteche, candidate of President Benavides' dictatorial regime, who was elected Oct. 22, 1939, and inaugurated December 8. Most of the government candidates for the Senate and Chamber of Deputies were successful in the 1939 elections as the strongest opposition group, the so-called Apra party, was forbidden to present candidates (see 1939 *YEAR BOOK*, p. 609).

## HISTORY

**Political Trends.** President Prado's government made notable progress during 1940 in its efforts to liquidate the Benavides dictatorship of 1933-39. The President's simple and democratic conduct during the first year of his administration reconciled many anti-Benavides groups to his regime and contributed to the stabilization of internal order. Coincidentally, the political importance of the outlawed Apra party was reported to have declined. In March Parliament approved a motion making all decree-laws of the Benavides Government valid unless specifically amended or repealed. This action was strongly criticized as undemocratic by the anti-Benavides press and political leaders. In September the Chamber of Deputies approved changes in the 1939 constitutional amendments to make certain that all Deputies elected in October, 1939, would remain in office for the full six-year

term and that elections to the Chamber would take place at the same time as the Presidential election.

**Economic Developments.** The two main problems confronting the Prado Government during the year were the adverse economic repercussions of the European War and the political and propagandist activities of the totalitarian powers, designed to wean Peru away from the Pan American front. The extension of the European War deprived Peru of additional important export markets. The resulting shortage of foreign exchange caused a further depreciation of the sol, curtailing domestic purchasing power and imports. The severe earthquake that shook the Lima-Callao district on May 24 was another economic setback. More than 322 persons were killed and nearly 5000 injured by the collapse of buildings in Lima, Callao, and surrounding towns and villages. Over 1000 buildings and dwellings were wrecked and several thousand persons made homeless. Another adverse factor was the curtailment of the heavy public works expenditures made during the Benavides regime.

Although eliminating European markets, the war brought improved prices for Peru's export crops and minerals. New markets were found in the United States and Japan. At the same time, the curtailment of imports and the depreciation of the sol aided all branches of domestic manufacture. The government also took measures to support economic activity. In April Congress authorized a 20,000,000-sol increase in the 6 per cent public works loan. On May 27 the government appropriated 20,000,000 soles, exclusive of municipal contributions, for the rebuilding of cities damaged by the earthquake. In August an agreement was reached with American bankers for repayment of a \$1,131,000 credit advanced in 1931, on which interest and principal were in arrears.

The social welfare program was expanded through additional social security and unemployment taxes authorized on Nov. 16, 1939. Price control measures introduced in 1939 were strengthened and extended. On May 29 the tariff was raised to curtail imports and encourage domestic manufacturing. The government also extended loans under liberal terms to small manufacturing enterprises, reserved unclaimed coal deposits for the State, commenced construction of roads into inaccessible regions to facilitate production of gold and other products, and encouraged the culture of flax. The Mining Bank of Peru was established under a law of July 24, 1940, to stimulate exploitation of minerals by Peruvian firms. Steps were also taken to consolidate the short-term floating debt at lower amortization and interest rates.

**Foreign Relations.** Sentiment in Peru became increasingly pro-Ally as a result of European War developments during 1940 and there was a marked trend toward closer co-operation with the United States in hemispheric defense policies. Disorders in Lima theaters attending the showing of British and American propaganda films early in the year caused the authorities to ban the showing of these movies. This action was severely criticized in the Senate on March 19 by Senator Pedro Ruiz Bravo, who charged that the disorders were the work of the Gestapo and the German legation. His resolution calling on the government to investigate "the intrusion of German elements" into Peruvian affairs was unanimously adopted by the Senate. A week later the Ministry of Education rejected the long-standing application of the German College to adapt its courses to the German secondary

school plan. However German and Italian propaganda agents redoubled their activities following the entry of Italy into the war and the collapse of France.

The Peruvians were even more alarmed by the activities of the large Japanese colony. Rumors that the Japanese had smuggled large quantities of arms and munitions into the country led in May to widespread attacks upon the Japanese in Lima. Many were injured and much property damaged. The Peruvian Government on May 17 expressed its regret over these disorders and promised Japan to pay for the damage to Japanese-owned properties and punish those responsible. However the Lima authorities suspended further Japanese immigration and President Prado in his message to Congress on July 28 stressed the danger to Peru posed by the German and Japanese doctrines of double nationality. At the same time he emphasized Peru's support of inter-American defense policies.

This policy was in line with a manifesto issued June 25 by leading Peruvian intellectuals, journalists, business men, and political figures calling upon the American republics to unite in defense of liberty. Other related developments followed. Col. Armando Revoredo, noted Peruvian aviator, was sent to Washington as head of an air mission to discuss hemisphere defense problems. The government in August decided to purchase the airplane factory and equipment in Peru of the Italian Caproni company. The leader of the Apra party, Dr. Raúl Haya de la Torre, in his new book *Normas Apristas*, repudiated the violent attacks upon "Yankee imperialism" characteristic of Apra's previous policy and came out in favor of co-operation with the United States as long as President Roosevelt's Good Neighbor policy was maintained. In October the Chief of the Peruvian General Staff visited the United States to inspect its military preparations and discuss mutual defense policies. A survey of Peru's sea-fishery resources by three U.S. Government experts was arranged for late in the year. The U.S. Export-Import Bank on December 18 approved a \$10,000,000 credit to the Central Reserve Bank of Peru to cover purchases in the United States. Also see under *National Defense* above.

**PETRILLO CASE.** See *PENNSYLVANIA* under *History*.

**PETROLEUM.** During 1940 the industry began to feel the full effect of the war. Every production, manufacturing, and consumption record of the industry was broken. Exports declined materially from 1939. Motor fuel particularly was affected, and exports dropped more than 40 per cent from the preceding year, due not only to decreased foreign buying but also to embargoes and export licensing by the United States. According to the Petroleum Institute crude petroleum production in the United States increased nearly 7 per cent in 1940 to 1,354,423,000 bbl., compared with 1,264,962,000 bbl. in 1939. A decline of 2 per cent occurred outside the United States, with an estimated world total production of 2,149,741,000 bbl. The United States' share of this production increased slightly to 63 per cent. Domestic refineries processed 1,291,516,000 bbl. of crude in 1940, an increase of 4 per cent over 1939. Production of motor fuel in 1940 totaled 614,459,000 bbl.,

against 611,043,000 bbl. in 1939. Domestic demand for motor fuel increased 6 per cent over 1939 to 590,737,000 bbl. in 1940.

The industry drilled 30,264 wells in 1940, of which 21,277 were completed as oil wells and 2,224 as gas wells. Crude oil prices remained at \$1.02 a bbl. throughout 1939 and were expected to approximate that average in 1940. The average retail price of motor fuel in 50 representative cities dropped in 1940 to 12.75¢, the lowest since 1919 except for 12.41¢ in 1933. The all-time high was 29.74¢ in 1920. Average gasoline taxes amounted to 5.66¢ a gal., aggregating \$1,146,000,000 in 1940. The average motor vehicle consumed 740 gal. of motor fuel in 1940 at an average cost of \$94.35.

**PHILADELPHIA MUSEUM.** See *ART* under *Museums*.

**PHILANTHROPY.** See *BENEFACTIONS* and the articles there referred to.

**PHILATELY.** See *STAMP COLLECTING*.

**PHILIPPINES.** A group of islands lying in the northern tropics, between the Pacific Ocean and the China Sea; former possession of the United States; since 1935, a commonwealth, designed to become independent in 1946. Capital, Manila.

**Area and Population.** The combined area is 114,400 square miles. This comprises 7083 islands, of which, however, only 466 cover as much as one square mile apiece. Two islands, Luzon (40,814 square miles) and Mindanao (36,906 square miles) account for more than two-thirds of the whole area. Others of important size, with their respective areas in square miles, are Samar, 5124; Negros, 4903; Palawan, 4500; Panay, 4448; Mindoro, 3794; Leyte, 2799; Cebu, 1695; Bohol, 1534; Masbate, 1255.

The inhabitants, by census of 1939, numbered 16,000,300; census of 1918, 10,304,310. The city of Manila had (1939) 623,362 inhabitants. Persons from the United States, other than members of its armed forces and their families, numbered 4144 in 1939. There were 117,461 Chinese; the Japanese numbered 29,262, of whom 17,888 were in and about Davao, on Mindanao Island. The Commonwealth made a law in 1937 declaring Tagalog (the most prevalent native tongue) the official language, but its full introduction awaited a dictionary and other aids. About one in eight of the population are estimated to have some knowledge of the English language; about one in 16, of Spanish. The Roman Catholic Church holds the greater number of the people of religious affiliation. An independent Filipino Church (Christian) has many worshippers. Mohammedans number not far from half a million. Worshippers of the Protestant denominations are estimated at 250,000.

**Education.** Public schools numbered 10,924 in 1938; 9489 were primary, 1316 intermediate, 114 secondary, and 5 junior colleges. These schools had 1,738,868 enrolled pupils. An Office of Adult Education, created in 1936, had 2057 special schools by the end of 1938, instructing 125,783 adults. Higher education is imparted in several technical institutions and two important universities: The University of the Philippines, state-supported, with

7711 students (1938); and the University of Santo Tomas, conducted by the Dominican Order.

**Production.** The islands produce for export a considerable variety of tropical products of the soil, such as sugar, abacá (Manila hemp), and the coconut; and several minerals, especially gold and the ores of iron and of chromium. They raise food sufficient for the inhabitants, save for a few items, such as wheat flour. They require from other sources mineral fuels, textiles, machinery, and a variety of other fabricated goods.

The mines' production of gold was estimated, for 1939, at 1,024,000 troy oz.; by value, \$35,840,000 in U.S. money. The year's output of gold continued a rise that had already multiplied the yearly total by five in the course of nine years. Iron ore was steadily mined, mainly for the Japanese market; ore of chromium likewise. Agricultural production of 1938, in quintals of 2.2 lb. av., included corn, 5,138,000; rice, 1,520,000; sugar, 9,283,000; copra, 6,049,000 (and for 1939, 6,646,000); abacá, 1,649,000. For the next crop year, 1939-40, first official estimates by value were available, in pesos: All crops, 381,067,000 (includes rice, 159,741,000; sugar, 97,524,000; coconuts, 52,439,000; abacá, 15,053,000; corn, 18,986,000).

**Manufacture,** which the government of the commonwealth particularly sought to develop, remained largely in the stage of trials and beginnings. The widely known Philippine embroidery, however, produced by hand in some 30 establishments, had a definite foreign market. Under the National Development Company, an agency of the government, cotton was spun and cement was made, while another governmental instrument, the National Rice and Corn Corporation, sought to develop the canning of fish and of vegetable foods.

**External Trade.** Total imports of 1940 were provisionally valued at 269,720,000 pesos (peso equals 50 cents, U.S. money), as against 245,535,000 for 1939; exports, at 231,830,000 pesos, as against 242,450,000. The totals for exports omitted gold and silver; there were exported, however, 77,750,000 pesos of these metals (almost all gold) in 1940 and 73,670,000 in 1939; and thus exports, the two metals included, amounted to some 309,580,000 pesos for 1940 and 316,125,000 for 1939. The lower value of exports in 1940 coincided with the loss of access to markets shut off by war and with a dearth of ships to carry exportable goods.

The Philippines regularly do the bulk of their external trade with the United States. The yearly report of U.S. foreign commerce indicated Philippine imports of U.S. merchandise to the value of \$93,335,474 for 1940 and of \$99,938,557 for 1939 (equivalent to twice as many pesos), and Philippine exports to the United States totaling \$89,670,500 for 1940 and \$91,927,137 for 1939, exclusive of gold and silver. Gold—mainly output of Philippine mines—exported to the United States amounted to \$38,630,151 for 1940 and \$35,637,107 for 1939; silver, similarly, to \$1,026,103 for 1940 and \$836,576 for 1939.

**See CUSTOMS, BUREAU OF,** for quotas on Philippine imports into the United States

**Finance.** The outline of the budgets subsequent to 1937 included not only an approximate balance of ordinary expenditures and receipts but also heavy capital expenditures otherwise met—principally out of a lump sum of over 111,000,000 pesos received in 1937 from the U.S. Government as an offset for the latter's collection of a tax on imported vegetable oils. The Philippine budget prepared for submission in 1941 called for expenditure

of 111,676,000 pesos, this including 12,397,000 of capital expenditure; it put ordinary income at 82,310,000 pesos and proposed to put receipts up to 112,982,000 by taking 20,672,000 from surplus and issuing bonds for 10,000,000 pesos. The budget for 1940 had called for expenditure of 89,149,000 pesos and had estimated receipts at 91,178,000; but there had occurred a deficit, from the operations of 1940, of some 10,000,000 pesos, and this was extinguished by drawing on divers surpluses and funds. Net bonded debt of central, municipal, and provincial governments: \$74,468,500 on Dec. 31, 1938.

**Transportation.** The island of Luzon has about 700 miles of railway, the greater part of all the rails in the Philippines. The Manila Railroad Company operates the lines in Luzon; the government of the Commonwealth owns this company's common stock. The Philippine Railway Company operates lines on the islands of Panay and Cebu, aggregating 133 miles. The Manila Electric Company runs a system of tramway lines and busses. Producers of sugar and of lumber have an aggregate of thousands of miles of rails, which they use in hauling their own goods. Two companies, in 1939, operated airplanes serving seven routes, 1097 miles in combined length, among the islands. Pan American Airways maintain regular service with the United States and Hong Kong. By sea, liners sail weekly to and from the United States. In 1940 the European War had the effect of depriving the Philippines of the usual supply of freighters for the bulky exports; the government of the Commonwealth created and financed the National Trading Corporation for the purchase and leasing of needed shipping.

**Government.** The system of government in operation in 1940 rested on the Philippine Independence Act, passed by the U.S. Congress in 1934. Under this act a constitution, written by a Philippine constitutional convention and approved by popular vote, went into effect Nov. 15, 1935. A President, elected by popular vote for a term of six years, exerts great executive authority. The power of legislation resides in a National Assembly of a single chamber of 96 members elected for three years. Under constitutional amendments adopted in 1940, the term of a President, after the end of the current six-year term, was cut to four years; his re-election, previously forbidden, was allowed, and in the special case of the immediate incumbent only, he could be re-elected for a term of two years to follow the six-year term. The National Assembly, after the close of the members' current terms, was to consist of two houses, through the addition of a Senate with its members elected at large. An electoral commission also was created.

The U.S. Government, pending the completion of independence in 1946, retains a measure of authority. The Commonwealth is limited as to public debt and some features of taxation. The United States keeps charge of foreign relations. Constitutional changes and such acts as affect currency, coinage, imports, exports, and immigration require the approval of the President of the United States. Appeal may be taken from Philippine courts to the U.S. Supreme Court. The Commonwealth's President must report periodically to the U.S. Congress and President on divers governmental operations. The U.S. Government maintains as its representative in the Commonwealth a High Commissioner.

President of the Commonwealth, Manuel Luis Quezon. U.S. High Commissioner, Francis Bowes Sayre.

## HISTORY

**Disturbing Factors of 1940.** The European War cut off the access of Philippine products to some markets in 1940 and restricted commerce with other customers. The prices obtainable for goods to be exported sank to figures in a number of cases below any previously touched in decades. The course of the Japanese Government in the lands across the China Sea made the informed fraction of the population uneasy, particularly about the somewhat concentrated colonization of Japanese in the Davao area of Mindanao. Belief in the wisdom of the intended dissolving of the political tie with the United States was shaken by continued evidence of Japanese determination to expand. Economic distress invited further exercise of the Commonwealth's policy of directing industry by governmental authority.

**Legislation.** The Assembly voted amendments to the Commonwealth's constitution, later adopted; they altered the duration of tenure of the Presidency (for provision as to President Quezon see above, under *Government*), added a Senate to the legislative body, and provided a powerful constitutionally entrenched electoral commission. By a vote of 67 to 1 was enacted an immigration law limiting the allowable ingress of immigrants from each other country to 500 a year; impartial in its form, this measure was expected to restrict only the admittance of Japanese. A tax was imposed on the milling of sugar cane by the centrals; its proceeds were to defray efforts of the government to improve the conditions in the sugar-making industry. Lengthening the list of corporate instruments for projecting state direction into economic activity, the Assembly created a National Trade Corporation, to promote oversea trade; a Coconut Corporation, to help sustain the depressed commerce in the products of the coconut, and a Tobacco Corporation, to perform a like service in its designated field. A labor act created a Court of Industrial Relations, the five judges were to have authority to investigate, settle, or decide all disputes between employer and employee; they went armed with power to impose serious punishment for contempt, either of explicit orders or of an implicit agreement, as envisaged by the act, against strike or lockout in any dispute, during the court's proceedings; employer and laborers' representative stood equally amenable to the court's orders. The session's appropriations were reported to total 208,139,600 pesos, not all for the ensuing fiscal year; of the whole, 80,452,000 fell within the general budget, 80,000,000 were to come from the coconut-oil excise receipts; 30,000,000 were for financing the coconut and tobacco corporations.

**Relations with Japan.** The U.S. Government, conducting diplomatic relations with Japan for the Philippines, agreed to the extension, for one year from July 31, 1940, of an existing understanding by which Japan might export cotton piece-goods to the Philippines; the admissible quantity of such goods for the stated year was set at 45,000,000 square meters. The arrangement tended to facilitate Japanese importation of Philippine ores of iron and other metals, even while the U.S. policy tended to cut down the exportation from the Union of such goods as might help Japanese aggressive warfare; but the Philippines' need of such markets as they could find was particularly strong at the time. A captain of Philippine Scouts, Rufo Romero, was convicted by court martial, November 25, of conspiring to sell to an unrevealed party

maps taken from Fort McKinley. No indication of the identity of those seeking military information transpired, but the incident tended further to stir doubt of the Japanese intentions in the Islands. See JAPAN under *History*.

**Relations with the United States.** U.S. High Commissioner Sayre declared, in an interview published at Manila, February 25, his belief that the taxpayers of the United States would be unwilling to support a force for the defense of the Philippines after their scheduled attainment of independence in 1946. He further expressed doubt whether the Philippine Government, having moved so far toward an independent status, could avoid going the rest of the way, even if it would. President Quezon in an address on March 27 declared his doubt of the Islands' sufficiency for their own defense against conquest and suggested the possibility of a continued bond, sufficiently loosened to let the islands make treaties, particularly for the improvement of their commerce. In September, Minister of Finance Roxas, endorsed by Quezon, broached the idea of a continued commercial bond with the United States and of the latter's continuing military aid to the Philippines. It thus appeared, as the intermediate period prior to independence reached the middle of its duration, that definite efforts to shield the Commonwealth from the rigors of an isolated freedom would not be lacking. The United States sent considerable forces of naval craft and airplanes to the Islands late in the year.

**Measures to Check Depression.** The National Trade, Coconut, and Tobacco corporations were all established and put to work during the year. The prices of securities in the market at Manila were pegged on June 11 to check their collapse. Depression started to ease toward the end of 1940.

**PHILOLOGY, Classical.** Certain tendencies adumbrated in this place in previous years are becoming more definite. The humanities are being given an increasingly important place in American education (see e.g. Patricia Beesly, *The Revival of the Humanities in American Education*), perhaps because of the crisis in human affairs and the growing feeling that the social and natural sciences alone are inadequate for complete education. New courses have been introduced in several colleges in which the Greek and to a less degree the Latin authors occupy the center of attention. The work is naturally done in translation, but even so it appears to be gradually affecting philological study. With edification rather than erudition as the avowed purpose of the new humanism, attention is centered on content rather than on form, on doctrine rather than on language. More narrowly philological studies thus tend to give way to studies upon the place of a given author or movement in the spiritual history of mankind. Attention is therefore focussed upon authors that merit a place in such a history, and not only the lesser writers but the lesser questions involved in the greater writers tend to be neglected. Lesser writers and lesser questions tend to be examined only for the help they provide in understanding a major figure or period. General works tend to deal with philosophy and religion and with the interpretation of political and economic phenomena with the classicist ends of *acumulatio* and even *imitatio* in mind.

The tendency to extract useful doctrine from the study of antiquity is even more marked, though less objectively pursued, in the totalitarian countries. Political theorists of antiquity are shown to prescribe the "Leader principle," the discipline of

Sparta is extolled at the expense of more democratic forms, and all that can make for national pride is underscored. The subservience of scholarship to the dominant political beliefs in Germany and Italy may be illustrated by a single example. An imposing history of Latin literature comes from the hand of Augusto Rostagni (*La letteratura di Roma repubblicana ed augustea*) from whom much was to be expected. But instead of objective scholarship as ordinarily understood the book is an extended argument, with rhetoric serving for demonstration, for the independence of Latin literature from foreign influence, especially Greek, though such influence is beyond question and was freely acknowledged by the Romans themselves. *Gnomon*, the German periodical with the greatest reputation for sound reviews of books in classical philology, proceeds to praise Rostagni's book in high terms.

Except from the conquered countries the stream of publications continues almost unabated. Bibliographical works, text collections, lexicographical works in progress, periodicals, and serial publications are listed in articles for previous years and will not be repeated here. Most continue to appear, though somewhat irregularly and in reduced volume. The major philological work of the year comes from England; it is the completed revision of the Liddell-Scott Greek lexicon by H. S. Jones and R. Mackenzie, both now deceased. Another great work completed in England this year is A. B. Cook's *Zeus*; both parts of the third and final volume are now published. A number of the year's other books must be mentioned: W. F. Albright, *From the Stone Age to Christianity, Monotheism and the Historical Process*; W. N. Bates, *Sophocles*; J. Carcopino, *Daily Life in Ancient Rome*; C. N. Cochrane, *Christianity and Classical Culture*; L. V. Cummings, *Alexander the Great*; R. J. Deferrari and others, *A Concordance of Lucan*; G. E. Duckworth, *Plautus, Epidicus*; E. R. Goodenough, *An Introduction to Philo Judaeus*; A. H. M. Jones, *The Greek City from Alexander to Justinian*; H. D. F. Kitto, *Greek Tragedy*; H. Michell, *The Economics of Ancient Greece*; Gilbert Murray, *Aeschylus*; M. P. Nilsson, *Greek Popular Religion*; Inez S. Ryberg, *An Archaeological Record of Rome from the Seventh to the Second Century B.C.*; V. H. Scramuzza, *The Emperor Claudius*; D'Arcy W. Thompson, *Science and the Classics*.

The character and volume of American work in classical philology may be gauged from the *Bibliographical Record* of the thousand-odd members of the American Philological Association, published in the Association's *Transactions and Proceedings*. Volume lxx (for 1939, published 1940) reports the seventy-first annual meeting of the Association, held at Ann Arbor December 27-29. Its nearly 700 pages contain thirty-seven complete articles, abstracts of thirty others, matter dealing with the organization of the Association and its work, and a list of the members and their bibliographical record.

MOSES HADAS.

**PHILOSOPHY.** The fortieth annual meeting of the Eastern Division of the American Philosophical Association at the University of Pennsylvania (December, 1940) brought together philosophers representing most of the schools and directions of thought in this country. Sessions were devoted to the philosophy of science, the nature of the mind, ethics and art, symbolic logic, religious philosophy,

and phenomenology, while a final symposium, sponsored by the American Association for the Advancement of Science as well as the A.P.A., took up the problem of science and value.

Ray H. Dotterer, in one session, argued that the paradoxes which seem to follow from the "principle of insufficiency" or "indifference" disappear if it is remembered that probability judgments are meaningless "except in relation to the data with respect to which they are asserted to be true." Victor Lowe attempted to define a naturalistic "temporalism" in the context of Whitehead's philosophy, while Erwin Biser argued that Heisenberg's uncertainty relations "are fundamental in nature and not merely due to the perturbation incident to the act of measurement and observation; nor to the fallibility of our concepts."

In another session, Ronald B. Levison concluded that, since Plato in the *Lawus* asserts that an act may be just although its consequences are bad, the gaps between Platonic and Kantian ethics is not so broad as has been supposed. Two papers on esthetics took Croce as a starting point. Helmut Kuhn, vindicating a problem rejected by Croce, asserts that "the festival is the focus of art in life." The interpenetration of the arts *inter se*, and with moral and social life, is also stressed by D. W. Gotschalk. He attempts, following in the path of Croce, to effect a synthesis of romantic and classic doctrine of art without isolating art, and the arts, from other phases of life.

W. H. Sheldon, speaking in the symposium on "mind," endeavored to combine conflicting theories in a sweeping perspective. "Philosophers," he said, "have usually taken mind as primarily cognitive, due to class bias, because they are themselves thinkers rather than doers; this abstract view is the main source of the oppositions." C. I. Lewis made the interesting point that although "my mind" can be defined as something with which I am directly acquainted, but you are not, solipsism does not follow from the alleged fact that other minds are not verifiable. Brand Blanchard, on the other hand, approached "mind" through the concept of teleology. The idealistic emphasis was also evident in a symposium on religious knowledge. Horace L. Friess, using the experience of the sacred to delimit the religious, argued that a liberalistic, historical approach to religious experience would serve to give us "our exact bearings spiritually," while J. S. Bixler upheld a religious knowledge, different from the scientific, but capable of some kind of confirmation. R. L. Calhoun, however, contrasted knowledge with the assurance, or faith, that the world makes sense. The latter is "a dynamic orientation of thought, feeling, and will, that underlies and sustains the more concrete efforts of reason."

Of the symbolic logic papers, the most interesting philosophically was "Towards a Basic Logic," by Frederic B. Fitch. A basic logic was set forth "within which it seems possible to give a non-semantic description of any system of logic whatsoever."

The symposium on science and value brought together some of the leading figures in American philosophy and science. Wilbur M. Urban, Frank H. Knight, Ralph B. Perry, and Professor Singer read papers, while Gregory Bateson, M. R. Cohen, Harlow Shapley, and O. H. Taylor led the discussion. The clearest, most decisive thesis was put forward by Perry. It was developed in his *General Theory of Value* (1926). Value is determined essentially by interest which develops and changes with evolution and environmental alterations.

One section of the program of the A.P.A. was devoted to a phenomenology which, exiled from Germany, has recently developed a new momentum in this country. Marvin Farber, Alfred Schuetz, Dorion Cairns, and Herberg Spiegelberg discussed different aspects of Husserl's phenomenological philosophy: Farber giving a general description of the phenomenological method, Schuetz relating it to William James' "stream of thought," Cairns maintaining that expressions "are ideal individuals," while Spiegelberg sought to determine the meaning of "self-evidence." All of these speakers, and a number of other students of Husserl, are represented in the *Philosophical Essays in Memory of Edmund Husserl* (1940). Some of the essays, such as those of Farber and Cairns, are purely expository of the descriptive, subjective, transcendental, *a priori* philosophy of Husserl. Others, such as those of Charles Hartshorne and V. J. McGill, are highly critical, the former in loyalty to certain religious and ethical conceptions, the latter from the point of view of materialism. Evidently the program of the new phenomenological movement is not to be thought of as narrow and sectarian. Jacob Klein in the same volume discusses the development of science in relation to recent writings of Husserl: *Eine Einleitung in die phänomenologische Philosophie*, and *Die Frage nach dem Ursprung der Geometrie als intentional-historisches Problem*. "The 'intentional history,' as suggested by Husserl, may accomplish this task: it may 'reactivate' the 'sedimented' 'evidences,' may bring to light the forgotten origins of our science. A history of science which fails to tackle this task does not live up to its own purpose, . . ." According to Klein, the "sedimented" understanding of numbers "is superposed upon the first stratum of 'sedimented' geometrical 'evidences.' The complicated network of sedimented significances underlies the arithmetical understanding of geometry. The second task involved in the reactivation of the origin of mathematical physics is, therefore, the reactivation of the process of symbolic abstraction and, by implication, the rediscovery of the original arithmetical evidences." Klein stresses the two most important Husserlian concepts, intention and evidence. Hermann Weyl also writes on the scientific implications of Husserl's thought. His subject is modalities in logical systems. Felix Kaufmann, on the other hand, explores the relation between phenomenology and a rival school of philosophy, logical empiricism, while Gerhart Husserl presents a phenomenological analysis of "Men and the Law." The journal *Philosophy and Phenomenological Research*, two issues of which appeared in 1940, carries on the kind of investigations initiated by the Husserl memorial volume.

Another school of philosophy which has become increasingly prominent in this country in the past few years is Neo-Thomism. The recent visits of such famous Thomists as Gilson, Maritain, and D'Arcy have doubtless stimulated interest. Another contributing factor has been the new educational policies sponsored by President Hutchins, Dean McKeon, and Professor Adler of the University of Chicago and Dean Buchanan of St. Johns College. This educational program emphasizes principles as against mere collocations of facts, deduction, and intuition as against crude empiricism. It prefers classics to modern opportunistic text books and orientation courses, and it insists that metaphysics reserve its medieval dignity as queen of the sciences and hub of the university. At times it appears that it is not metaphysics, but theology, which is to

be the final arbiter of truth, and sovereignty is not usually assigned to theology in general, but to Catholic theology and specifically to Thomism. Thus Professor Adler in his Aquinas Lecture, *St. Thomas and the Gentiles*, argued that if Shakespeare is the universal poet, St. Thomas is, by the same reasons, the universal philosopher. The same writer, in an address before the Conference of Science, Philosophy, and Religion in New York (1940), entitled "God and the Professors," excoriated positivism in all its forms, maintaining that at bottom it is "the affirmation of science and the denial of philosophy and religion." In Adler's opinion, "the most serious threat to Democracy is the positivism of the professors, which dominates every aspect of modern education and is the central corruption of modern culture. Democracy has much more to fear from the mentality of its teachers than from Hitler." Because of its challenging and programmatic character, this speech received much publicity and criticism. Adler went so far as to state seven propositions which must be affirmed. "He who denies any one of them denies philosophy." The third of these principles asserts that philosophical and scientific truths are logically independent of one another. The fourth asserts philosophy is "superior to science both theoretically and practically," while the fifth denies that there can be a conflict between the two orders of truth. Other principles affirm that the foundation of all philosophies must be metaphysical and that metaphysics is able to demonstrate the existence of God "without any reliance upon articles of religious faith." Naturally critics were quick to point out that these requirements disqualify almost all American philosophers, and even many Medieval philosophers to whom Adler defers as authorities. But the address was printed under the imprimatur of the Church. In the same conference views conflicting with Adler's were heard. Professor Albert Einstein, for example, argued that the belief in a personal God is unscientific and pernicious.

The Thomist view of politics is set forth authoritatively by Jacques Maritain in his *Scholasticism and Politics* (translation edited by M. J. Adler). The central emphasis in Maritain's integral humanism or organic democracy is upon the *value of the person*, which, he believes, could be preserved and enhanced in a hierarchical system of persons, if the higher governed the lower as persons, not as things. The advocacy of organic democracy and corporatism is expressed more clearly by the various contributors to *The Philosophy of the State*, Vol. XV of the Proceedings of the American Catholic Philosophical Association. The Church criticizes totalitarianism, according to Waldemar Gurian, not because it is opposed to modern democracies, but because it makes religion subservient to the state which then usurps the place of God. Charles A. Hart claims that what the Church deplores is the modern laicized state, whether fascist, liberal democratic, or communist. The ideal upheld in this book is the corporate state, outlined by Leo XIII and Pius XI, and partially realized in Italy, i.e. an authoritarian hierarchical state, ruled from the top down, but consistent nonetheless with democracy.

The positivists, specifically the logical positivists, were under fire this year from another quarter to which Thomism is altogether hostile. Bertrand Russell's criticism of the school in his *An Inquiry into Meaning and Truth* is especially noteworthy inasmuch as he and his pupil, Ludwig Wittgenstein, were the greatest formative influences on the

original Vienna Circle. While in sympathy with many phases of logical positivism, Russell objects to panlogism, the transformation of the whole subject-matter of philosophy into words, and he insists that the evidence for a factual premise "is the event to which it refers . . . a unique occurrence, not a sentence or proposition or belief; . . ." He argues that while Rudolf Carnap's language seems to suggest that something can be learned from a single observation (because Carnap states that in testing a factual statement we make a set of simple observations), he never tells us *what* we learn from any one of these observations. Russell's espousal of the correspondence theory of truth also brings him into opposition with John Dewey. Rejecting Dewey's proposal to substitute "warranted assertibility" for truth, he holds fast to the concept of truth. Dewey, he contends, makes the goal of inquiry, "not the attainment of truth, but presumably some kind of harmony between the inquirer and the environment. . . . Dr. Dewey rejects the traditional answer, that I come to *know* something, and that, as a consequence of my knowledge, my actions are more successful. He eliminates the intermediate stage of 'knowing,' and says that the only essential result of successful inquiry is successful action." But Russell's book is not mainly polemical. Many of the logical and epistemological problems with which he has been occupied for the last forty years are resolved anew in the light of current philosophical developments.

Bertrand Russell also contributed an essay this year to *The Philosophy of George Santayana*, Vol. II of the Library of Living Philosophers. One of his criticisms of Santayana is of particular interest. He complains that realism cannot be justified by "animal faith." "All unproved beliefs are . . . expressions of animal faith, but the problem of the theory of knowledge is to find some way of selecting some of these as more worthy of credence than others. This cannot be done by ultimate skepticism, which rejects them all, nor by animal faith, which accepts them all." All phases of Santayana's many-sided philosophy are considered by the various contributors to this volume: Esthetics, theory of value, literary criticism, poetry, religion, politics, etc. But the most rewarding portions of the book are perhaps Santayana's own confession at the beginning and his answer to critics at the end.

The most important book in the field of esthetics was probably T. M. Greene's *The Arts and the Art of Criticism*. This handsome volume with 300 illustrations exemplifying critical judgments in the text is much more concerned with an analysis of the arts, than with esthetic theory as such. The thesis put forward here, as in an article "Beauty and the Cognitive Significance of Art," (*J. of Phil.* XXXV pp. 365-381), is that all art is "cognitively significant" and is to be evaluated, without metaphor, as true or false. The directly opposite view that art is not always cognitively significant and that its essence is subjective feeling evoked in the observer, has been put forward in recent years by Prof. C. J. Ducasse, who has been strongly influenced by Santayana's *The Sense of Beauty*. This basic conflict in esthetics has occasioned considerable dispute and partisanship.

Among the books on Greek philosophy one stands out by reason of the originality and challenge of its method. A. D. Winspear, in *The Genesis of Plato's Thought*, breaks new ground in the history of philosophy by attempting a systematic explanation of Plato's philosophy, not only in terms of preceding philosophers, but also in the light of

the political, social, and economic conditions and issues of his time, and of foregoing periods back as far as the society of the Homeric epics. The Pythagoreans who greatly influenced Plato, and who are usually represented as politically disinterested, are shown to be sponsors of the oligarchs and, in general, the ideas of Plato (and other philosophers) are shown to have political motivation and consequences and to change with social strife. "The rift in thought (between the one and the many, the permanent and the changing) reflects the rift in society. Until that conflict is resolved in actuality, or at least in hope, the troubling doubt that haunted Plato must continue to perplex his philosophical successors."

Logical positivists, pragmatists, operationalists, symbolic logicians seem to be increasingly concerned with the nature of language. As B. Russell comments ironically, "Some modern philosophers hold that we know much about language, but nothing about anything else." As an antidote to this tendency Anton Marty's posthumous work, *Psyche und Sprachstruktur* (just published by Otto Funke), should prove valuable. Although his approach to language is psychological and unmathematical, many of his key distinctions parallel those of B. Russell. For example, Marty's distinction between categorimatica and syncategorematica is similar to Russell's complete and incomplete symbols. Although exceedingly subtle in its way, it is doubtful whether philosophers concerned with language, apart from the phenomenologists, will profit by a tradition so remote from them.

Of the many works on the Philosophy of Science to appear, Oliver L. Reiser's *The Promise of Scientific Humanism* is distinctive in a number of respects. Reiser discusses controversial philosophical questions arising in a surprisingly large number of sciences and illuminates most issues by snatches of history and apt citations of current polemics. The author's thesis is that modern science has outgrown Aristotelian logic, that its needs are now best served by non-Aristotelian logic, which he attempts to develop in scientific contexts, with many citations to prove that modern science is now approaching his position.

Another book which upholds a kind of "new realism," and discourses on perception, time, history, happiness, and other philosophical topics with eloquence and robust earnestness is *An Essay on Nature*, by F. J. E. Woodbridge.

**Bibliography.** Besides the titles mentioned above in the text, the following books are significant: *The Problem of Species*, Mortimer J. Adler; *Experience, Reason and Faith: A Survey in Philosophy of Religion*, E. G. Bewkes; H. B. Jefferson, E. T. Adams, and H. A. Brantigan; *The Nature of Thought*, Brand Blanchard; *La philosophie et son passé*, Emil Bréhier; *A Philosophy of Religion*, Edgar Sheffield Brightman; *An Essay on Metaphysics*, R. G. Collingwood; *A History of Indian Philosophy*, Surendranath Dasgupta; *Education Today*, John Dewey (edited by Joseph Ratner); *The Living Thoughts of Thomas Jefferson*, John Dewey; *Positive Democracy*, James Fiebleman; *Methoden und Hilfsmittel des Aristotelesstudiums im Mittelalter*, Martin Grabmann; *Reason Social Myths and Democracy*, Sidney Hook; *A History of Esthetics*, K. E. Gilbert and H. Kuhn; *The Problem of Religious Knowledge*, Douglas Clyde Macintosh; *Science and Wisdom*, Jacques Maritain; *The Ways of Things*, William Pepperell Montague; *The Human Enterprise. An attempt to Relate Philosophy to Daily Life*, M. C. Otto; *Shall not Perish from the Earth*, Ralph Barton Perry; *Mathematical Logic*, Willard Van Orman Quine; *Skepticism and Dogma*, Ralph Gilbert Ross; *Catholic Principles of Politics*, John A. Ryan and Francis J. Boland; *Catholic Social Theory*, Wilhelm Schuer; *The Nature of the World. An Essay in Phenomenalist Metaphysics*, W. T. Stace; *Adversity's Nobleman*, *The Italian Humanists on Happiness*, Charles Edward Trinkaus.

**PHOTOENGRAVING.** See PHOTOGRAPHY.

**PHOTOGRAPHY.** War abroad dominated the photography of the year. The daily papers, news weeklies, and motion-picture news reels featured war on land, at sea, and in the air. Many of the photographs had been taken under extremely difficult conditions, action at sub-zero in Finland's snow-covered forests, action in desert heat and sand-storm in Libya, on warships in Norwegian fiords, the stormy North Sea, and the English Channel. Army cameramen covered their assignments during the invasion of Norway, Holland, and Belgium. The amazing retreat and evacuation of the British army at Dunkirk was carried out not only under blazing gunfire and bombings but also under the searching eye of the camera. From the air, photographs were made from reconnaissance planes before, during, and after every major action (Figure 1).

Men were trained with the aid of still photography and motion pictures to care for themselves and others and in all forms of actual combat. Portable photographic laboratories were used in the field equipped with the latest types of processing apparatus to permit the most rapid delivery of good quality pictures. Major General Arnold reported that color photographs could be made successfully from airplanes flying more than 200 m.p.h. and at heights ranging up to about 2 miles. The United States Army Air Corps at Wright Field, Dayton, Ohio, and the United States Naval School of Photography at Pensacola, Florida, have been experimenting with color photographs from the air since 1936. Major Goddard of the Army Air Corps was stated to have made several hundred color photographs on Kodachrome sheet film during the last two years. With the use of such films, it was predicted that the military expert might be able to detect camouflage more easily as well as to distinguish more clearly natural landmarks (*Nat. Geog. Mag.* 77: 757, June, 1940).

Improved infrared-sensitive films were being used for the penetration of atmospheric haze, and aerial photographs were made at night with the aid of large flash bombs timed to explode synchronously with the maximum opening of the camera shutter. This problem was studied during October at Rochester, N.Y., under the direction of Major Goddard and with the co-operation of the Kodak Research Laboratories.

Mechanics of the new mechanized army of the United States were being instructed with the aid of slide-film and motion pictures at the Quartermaster Depot in Maryland (*Business Screen*, 3: No. 1, p. 13, 1940). In Great Britain, it was reported that the cameras for aerial use over enemy territory usually were loaded by the ground staff, who fitted them with the correct filter and set the shutter and aperture before turning them over to the observer-navigator who was also the photographer. A typical camera used by the Royal Air Force was loaded with sufficient film to make 125 exposures (5 by 5-inches) (*Popular Phot.* 6: 16, May, 1940). Fighter planes were equipped with 16-mm. cameras which operated automatically to make records of machine gun fire.

In the design and production of aircraft, photography became recently a most valuable method of saving time and costs, as well as eliminating errors. This application had especial significance in view of the rapidly growing American defense program which developed during the latter part of the year.

Engineering drawings in full scale of the different parts of the plane were made on a raised floor called a "loft." Next, a very large camera was used to make an accurate photograph of the drawing, and the negative so obtained was enlarged onto large sheets of an aluminum alloy of a maximum size of 5 by 10 feet which had been coated with a photographic emulsion. The drawing appeared in full scale (or in fractional or multiple scale) and the tool makers could work directly from it when checking semi-finished parts, or patterns and templates could be cut directly from it (Figure 2). A saving of more than \$80,000 was said to have been made by the Glenn L. Martin Company of Baltimore, Md., in 1939 by the use of these methods and it was understood that they were being used effectively in other plants. (*Amer. Phot.* 34: 886, Dec., 1940)

The U.S. Army Air Corps had started to use airplanes especially designed for photographic use. Equipment included camera mounts built into the body of the plane and openings were made at various locations in the plane advantageous for camera use. The planes were said to be capable of a service ceiling of 30,000 feet and a cruising speed of about 200 m.p.h. (*Nat. Photonews Weekly* 1: 4, Aug., 1940).

**Photography in Color.** Perhaps the most important advance of the year was the announcement by Dr. C. E. K. Mees at the Christmas Lectures at the Franklin Institute (Philadelphia) that Kodachrome film was being processed by an improved method. The new procedure is more rapid than that in use since the introduction of this color film in 1935, and it results in better quality pictures. The former method required three separate color developments on three continuous machines and a drying operation between each machine treatment. By the new method, the film is processed continuously on a single machine. After the development of the film to a negative, it moves forward through the machine to a point where it is exposed to red light through the back of the film, which affects only the back or red-sensitive layer of the triple emulsion. Next, the film passes to the cyan developer and a blue-green dye image is produced in the back layer without affecting the two upper layers. After this stage, the film is exposed to blue light from the top, which acts only on the top layer and permits the subsequent development of a yellow dye image therein. Finally, the middle layer is developed to form a magenta dye image. The silver that is formed during dye image development is removed subsequently from all three layers leaving a final film having only three superposed dye images.

An increasing number of amateurs and professionals were known to be using color films especially since the introduction of cameras and projectors at moderate prices. It was reported by the *Photographic Dealer* (Hollywood) that the sale of color film in 16-mm. and 8-mm. sizes for motion pictures had exceeded the sale of black and white films for the first time since color films were introduced.

Photoengravers were understood to have mastered quite well the problem of satisfactory color reproductions from Kodachrome transparencies. Smyth and Seymour gave working details for making separation negatives from such films. (*Photo Technique* 2: 23, Feb., 1940.) A New York firm, Triak Color Processes, were reported to have made more than 50,000 wash-off relief prints from color films in one year. Automatic control methods permitted 15 color separation negatives to be made

simultaneously from 35-mm. color transparencies (*Photo Technique* 2: 24, Dec., 1940). The world's largest job of reproduction of Kodachrome photography was said to have been a "Paint and Color Style Guide" containing 236 plates, many almost full page size or 16 by 18½ inches. Each book weighed 4 lbs. and 25,000 copies were printed (*Printers' Ink Monthly* 40: 38, Apr., 1940).

The masking method of color correction, whereby one or more of the separation negatives for color photogravure are combined with positives of lower contrast made from the other separation negatives, was reported by Cartwright to give only partial correction (*Phot. J.* 80: 289, July, 1940). Progress in color photography as shown by new patents was covered in a series of articles running through the *British Journal of Photography* (87: 112, Mar. 8, 1940, *et seq.*). The Keith Lectures of the Royal Scottish Society of Arts (Edinburgh) were given by Dr. D. A. Spencer and dealt with theory and processes of color photography (*Edinburgh J.* Vol. 14, Pt. III, 96, Apr., 1940). A stimulating review of the applications of physics in color photography was published by MacAdam (*J. Applied Physics* 11: 46 Jan., 1940).

During the summer, Washburn, Director of the New England Museum of Natural History made his ninth exploration of Alaska's coastal ranges. Besides making many black and white photographs, he brought back about 100 Kodachromes on sheet film (8 x 10-inch), which represented the first large-scale use of such film for field investigation of glacial terrain. A Fairchild K3B aerial camera on a tripod was used.

**Microphotography.** Within recent years the micro-filming of documentary material had grown into one of the most important applications of photography. Vastly improved equipment had been made available and the operation of such apparatus was simplified. One firm claimed for their equipment that 120 full letter pages could be copied per minute, or 20 newspaper pages, or 10 engineering drawings,—tasks which require several hours to weeks by manual methods. All numbers drawn in the United States national draft lottery in October were photographed at once after being drawn (Figure 3). Each number was dry-mounted on a form and photographed with a Micro-File Recordak in groups of 250. Enlarged prints were made from the film negative and used to prepare photo-offset plates from which complete copies of the master list were printed for distribution to the 6175 local draft boards throughout the nation.

The public library in Gary, Ind., was using a micro-film camera and 16-mm. film for charging all books in daily circulation. About 7000 charges could be made on one hundred feet of film, costing \$2.75 including processing. An estimated annual saving was expected in all branches of the Gary library system of about \$5000. (*Library J.* 65: 341, Apr. 15, 1940.) The New York Public Library was reported to be building up an archive of outstanding music manuscripts on micro-film. More than 130,000 pages of newspapers had also been photographed.

Department stores were beginning to use micro-photography quite extensively for recording their sales slips, and reductions in billing costs as much as 50 per cent over previous methods were said to have been effected. It was understood that records of machine design on micro-film were shipped from England to Canada as a rapid and accurate method for acquainting factories in North America with details of needed parts required in the

defense program. Publicity pictures released by the British Broadcasting Corporation for overseas use were printed in reduced size and then enlarged again after receipt on this side, thus avoiding the expense and heavy wrapping of large prints.

**Photomechanical Processes.** New orthochromatic and panchromatic films and plates for use in the graphic arts field were introduced and the quality of four-color photoengravings were improved. Murray demonstrated the use of fluorescent pigments for three-color separation work at the Photo Lithographers convention in Chicago. Yule continued his study of the theory of subtractive color photography and published results on four-color processes and the black printer (*J. Opt. Soc. Amer.* 30: 322, Aug., 1940).

The Hartford (Conn.) *Newsday* was said to be the first metropolitan daily newspaper to be produced entirely by offset lithography. About 50 per cent of the editorial space was devoted to illustrations. The typematter was being set by Linotype but it was planned, if possible, to adopt type-composing devices using the offset process. (*Modern Lithography* 8: 55, May, 1940.)

The Seattle *Times* for May 4, 1940, contained the first natural color news photograph (the Lake Washington Bridge) to appear in the news section of any Pacific Northwest newspaper. A printing rate of 38,000 copies per hour was maintained and no black printer was used.

**Motion-Picture Photography.** During the first part of the year, the longest feature color motion-picture, *Gone With The Wind*, was shown throughout the United States. The projection apparatus in all theaters showing the picture was fitted with special lenses which had been specially coated to increase their light transmission about 30 per cent. By eliminating internal reflections, it was claimed that these lenses gave the projected picture greater detail, better contrast, and freedom from color degradation.

A special stereophonic sound demonstration was given at Carnegie Hall (New York) on Apr. 9, 1940. It consisted of orchestral selections by the Philadelphia Symphony Orchestra, organ music, a scene from an opera, and choral singing,—all reproduced from a photographic record on film. Four sound tracks were recorded on the film, three of the actual music and the fourth for volume control. Undistorted amplification of ten times that of the original sound volume was claimed for the system which had been developed by the Bell Telephone Laboratories (*Bell Labs. Record* 18: 260, May, 1940).

The initial public showing of Walt Disney's musical production *Fantasia* was held at the Broadway Theater in New York in November. (See **MOTION PICTURES.**) For this unique combination of animated color cartoon and musical recording, about 420,000 feet of film was used to record several orchestral selections as played by a large orchestra in Philadelphia under Stokowski. The recordings were made by an improved type of R.C.A. equipment called "Fantasound." From these recordings, 18,000 feet were chosen for the picture. The cartoons and drawings were intended to help the audience "visualize" the music. The picture was planned to be shown only in 75 cities in the United States because of the complex sound reproduction system required for each exhibition (Figure 4). The sound was recorded as four tracks and played from a separate projector from that used for the picture. Three sets of loud speakers were located behind the screen and other units at select-

ed points in the auditorium (*Mot. Pict. Herald* 141: 21, Nov. 16, 1940). It was understood that Disney plans other productions of this type.

An interesting development of the year was the release of equipment and sound picture films for nickel-in-the-slot motion pictures. This plan represented a revival on a modern scale of the first type of equipment for motion pictures, the Kinetograph of Thomas Edison.

According to a survey made by the Motion Picture Division of the U.S. Department of Commerce at the beginning of the year, about 65,000 of the 67,000 motion-picture theaters known to exist in 98 countries of the world were equipped to show sound pictures. In this country, approximately 17,000 of the 19,000 theaters were said to be in operation and the seating capacity of these was about ten million persons. Approximately 78,000,000 feet of motion-picture film (negative and positive) were exported during the first half of the year, compared with 79,000,000 feet for the same period a year ago.

A steady growth of public interest in amateur motion pictures was apparent from the reports of the dealers as well as the introduction of new films and equipment. Excellent pictorial and sound quality was reported by Maurer to be obtainable by direct photography and recording on 16-mm. film (*J. Soc. Mot. Pict. Eng.* 35: 437, Nov., 1940). This method was said to be of special value in the production of training films and other types of industrial and educational motion pictures.

The first educational film in Kodachrome for commercial distribution was announced during the year by Eastman. The picture, entitled *How Birds Feed Their Young*, was made by Dr. A. A. Allen, ornithology professor at Cornell University. Courses in the use of motion pictures in the classroom were being given in 114 universities and colleges in 27 States according to a report from the United States Office of Education in Washington, D.C. (*Mot. Pict. Herald* 140: 9, July 27, 1940).

New types of industrial motion pictures appeared during the year and new uses for such pictures were introduced. At the Chrysler Pavilion at the New York World's Fair, a stereoscopic color motion-picture, called *New Dimensions*, was shown daily to thousands of visitors. This picture was made in Technicolor and used Polaroid to secure the third dimensional effect. It also included numerous stop-motion effects which were secured by special process photography. Improved projection facilities were used in the 1940 showing of the "Cavalcade of Color," a changing mural from projected Kodachromes, in the Kodak Building at the Fair. A sound picture called *The Year's Work* was made for General Mills and was shown at eight stockholder's meetings, held in different parts of the country. It was said to be the first time that a motion picture had been made specifically to show the activities of a company to its owners (*Business Screen* 3: No. 1, 11, 1940).

**Stereoscopic Photography.** A method of stereoscopic photography called "vectographs" was described by Land, the inventor of Polaroid, a sheet polarizing material which has been used in several ways in photography. In a vectograph, two different images in black and white can be superposed on a single surface for viewing through polarizing spectacles (*J. Opt. Soc. Amer.* 30: 230, June, 1940). Method of manufacture of various kinds of synthetic polarizing devices and a review of the patent literature in this field were published

by Nähring (*Phot. Ind.* 38: 599 and 629, Oct. 9 and 23, 1940).

**Applied and Scientific Photography.** One of the most significant announcements of the year was the report from the Kodak Research Laboratories that photographs made with the electron microscope had revealed the actual structure of the silver grains in a photographic image. It was shown to be of a filamentary nature rather than a coke-like mass, as had been described theretofore, and the thickness as well as the shape of the filaments appeared to depend upon the developer. Details of hairlike threads about 5 to 10 atoms thick were shown quite clearly with the electron microscope which has the advantage over the optical microscope of great depth of focus as well as high resolving power (*N.Y. Times* 90: 19, Nov. 26, 1940). This technique had also been developed independently by von Ardenne (*Z. Angewandte Phot.* 2: 14, 1940.) See also CHEMISTRY, under *Electron Microscope*.

High-speed stop-motion photographs were made of the spray from the nose and mouth of persons while sneezing. These studies represented a part of an investigation conducted by Prof. M. W. Jenkinson of the Department of Biology and Public Health of the Massachusetts Institute of Technology. The photographic technique used required the employment of an Edgerton camera and lamp. It was found that in some cases droplets were sprayed from the mouth into the air at speeds as high as 150 feet a second (*N.Y. Times* 89: 32, Apr. 20, 1940). A special camera was used to photograph steam jets traveling 1500 m.p.h. as they hit a turbine blade making 3600 r.p.m. The behavior of turbine blades under 1250 lb. of steam pressure at 900° Fahrenheit was studied by this means for the first time (*Pop. Mechanics* 73: 849, June, 1940). As a result of a study of high-speed photography applied to machine performance, Watson concluded that a speed of 1000 frames per second of a motion-picture camera is ample for the photography of most machines. A stroboscope was found to be satisfactory for investigating the action of machines provided the speed of the moving parts is more than 12 cycles per second (*Product Eng.* 11: 340, Aug., 1940).

Many head of cattle were recovered and returned to their owners by the Wyoming Stock Growers' Association after their brand inspectors were equipped with cameras. As the cattle passed through the large markets, they were examined by the inspectors who photographed any cattle with doubtful brands. The camera had also proved a useful means of catching cigarette smugglers who bought the tobacco in Maine without tax and transported it into Massachusetts where it was taxed. Photographs were made of drivers of cars with Massachusetts license plates as they purchased cigarettes at roadside stands in Maine and their car licenses were photographed. Tax investigators mailed a notice of the tax to each such individual and, if necessary, sent him a picture of himself purchasing the cigarettes. More than \$10,000 was recovered by the State at a cost of less than \$400.

Enlarged photographs of the retina and inner tissue of the eye were suggested by Dr. J. R. Dean of the American Optometric Association as an accurate means of identification of individuals. Since criminals sometimes alter or disguise their fingerprints, this proposal offers promise as a valuable method of supplementary identification (*Camera*, 60: 121, Feb., 1940). The partially decomposed body of a man, found in a railroad cold-storage

car near Rochester, N.Y., was identified as John Dunphy who had served in the U.S. Army from 1908 to 1917. Identification was possible chiefly by soft x-ray radiographs of the skin dissected from the fingers, supplementing the normal finger print impressions.

The use of x-ray radiographs of pearls was being accepted quite widely by leading jewelers as an accurate means of identifying natural, cultured, and synthetic pearls. Sherwood, of the Kodak Research Laboratories, developed a special masking technique for the elimination of scattered radiation when making radiographs of this type.

The Westinghouse Laboratories developed a high-speed x-ray technique which consisted of passing the discharge from a bank of condensers through a cold cathode x-ray tube. With the resulting surge of about one-millionth of a second duration, it was possible to make radiographs of various objects moving at a high rate of speed, such as bullets, golf balls being hit by a golf club, a football being kicked (Figure 5), and a vacuum-cleaner in operation. The motile organs of flagellae of typhoid bacilli were photographed for the first time by micro-cinematography (*J. Biol. Phot. Asso.* 8: 158, June, 1940).

**Physical Measurements.** Considerable progress was made on the problem of standardization of photographic practice by nine subcommittees of Sectional Committee Z-38 of the American Standards Association. The work of these subcommittees covered the formulation of definitions, dimensional standards, recommended practices, and the establishment of methods for testing, rating, and classifying the performance characteristics of materials and devices used in photography, including the industrial applications but excluding cinematography. In November, Subcommittee 2 on Sensitivity to Radiant Energy published details of a proposed standard method for determining photographic speed of roll film, film packs, and miniature camera films. After a year of trial and criticism, the method will be considered for adoption as an American Standard and may then be used as a basis for recommended exposures for picture taking and the assignment of speed numbers to films (*Ind. Standardisation* 2: 277, Nov., 1940).

An apparatus and a method of development evolved by a technical committee of the British Standards Institution consisted of a Dewar flask and a fitting for two film strips. Quite reproducible results were claimed for this method of development (*Phot. J.* 80: 341, Aug., 1940). A contrast meter for photographic papers was described by Morrison with which a value for contrast could be obtained by a simple scanning of the sensitometric curve with the viewing head of the instrument (*J. Opt. Soc. Amer.* 30: 299, July, 1940).

Photoelectric exposure meters which measure incident illumination directly were stated by Norwood to be of value since they tend to eliminate some of the errors which occur when a reflectance-type meter is used. A more accurate reading would result if an integrating translucent hemisphere were located in front of a suitable photoelectric cell (*Amer. Cinematographer* 20: 499, Nov., 1939, *et seq.*).

A stroboscopic method of measurement of shutter speeds was described by Tawney, with which adequate accuracy could be obtained for several types of shutters (*Photo Technique* 2: 34, Mar., 1940). Gillon defined the optical considerations in precision enlarger design and concluded that enlargers of the condenser type were more satisfac-

tory than diffuse enlargers for miniature work provided uniform illumination was secured at the easel and a satisfactory scheme was used to minimize specularly of light passing through the negative (*Photo Technique* 2: 24, Feb., 1940).

Tupper evaluated the physical and photographic aspects influencing variations in the measurement of filter factors and described a method which eliminates the effect of the failure of the reciprocity law (*Photo Technique* 2: 29, May, 1940).

A sensitometric study of a gaseous, condenser-discharge lamp of the Edgerton type was made by Tuttle, Brown, and Whitmore. It was shown that the constants of the electrical circuit of the lamp play a large part in the determination of its photographic effectiveness (*Photo Technique* 2: 53, Sept., 1940). Various phases of the laws of response of photographic emulsions to high energy atomic particles such as alpha rays, protons, and deuterons were discussed by Wilkins (*J. Appl. Physics* 11: 35, Jan., 1940).

Fine displays of the aurora during March and April were photographed by Gartlein, who continued his investigations of this little understood natural phenomenon under the auspices of the National Geographic Society and Cornell University. On the night of March 24-25, he made the best single spectrogram of the aurora that had ever been taken. A large two-prism spectrograph having a cylindrical lens was used and the resulting photograph showed lines of ionized nitrogen never before observed (Figure 6).

**Manufacture of Sensitized Materials.** A limited number of new sensitized materials were introduced during the year as compared with previous years. The principal new films were high-speed fine-grain motion-picture films, high-contrast ortho and panchromatic films for graphic arts work, and a very high-speed film for use with a new commercial gaseous-discharge lamp. One of the most interesting films for use in miniature cameras was a fast panchromatic emulsion which could be developed directly to a positive transparency of extremely fine grain.

Another sensitized product that attracted attention was a multiple-contrast bromide paper. Three types were announced, one in England in May (*Brit. J. Phot.* 87: 270, May 31, 1940), and two others in this country in August. With each of these papers, blue or yellow filters, or combinations of them, in the printing light were used to control the degree of contrast of the print. Thus a single grade of paper was provided with which prints could be made from negatives of different degrees of contrast (*Defender Trade Bull.* 24: 3, 1940).

The effect of halides on the stability of emulsions was reported by the Russian investigator, Borin, who confirmed results of others and presented some new data (*Kino Photo Chem. Ind.* No. 3, 36, 1940). The necessary and sufficient conditions for a dye to act as an optical sensitizer of silver halides were defined by Sheppard, Lambert, and Walker (*Nature* 145: 969, June 22, 1940). Several papers relating to photographic emulsions were published by Trivelli and Smith, under the following subjects: Development of photographic emulsions in relation to the coating thickness; effect of the silver iodide upon the structure of silver bromo-iodide precipitation series; further investigations in the empirical relations between speed and average grain size of a precipitation series (*Phot. J.* 80: 12, 285, 381, Jan., July, and Sept., 1940).

**New Apparatus.** Continued interest in photog-

FIG 6. SPECTROGRAM OF THE AURORA BOREALIS

Made on a two-prism lens, March 24-25, 1940, exposed two hours. Shows lines of ionized nitrogen never previously recorded

raphy at night was shown by the amateur, the professional, and the news cameraman as a direct result of the introduction in recent years of roll and sheet films of improved quality and speed, and of several varieties of flash-lamps and synchronizers. Color photography with daylight Kodachrome was said to have been made more flexible by the introduction of blue-coated flash-lamps, which could be used to supplement daylight or for night pictures. Several new flash synchronizers were announced with which very accurate synchronization of full shutter opening and lamp flash was claimed to be obtainable.

A small camera described by Gilbert was distinguished by the use of a disk-shaped negative on which 20 exposures could be made, each measuring  $\frac{1}{2}$  to  $\frac{5}{8}$  inch. The camera could also be used for motion pictures (*Pop. Phot.* 6: 36, Apr., 1940).

Reflections from air-glass surfaces of the components of lenses have presented a serious problem for many years in the optics of lens design. Within the last four years, methods were discovered of treating a lens surface to eliminate flare and ghosts and increase greatly the light transmission of the lens. A brisk demand grew up during the year from professional photographers and motion-picture cameramen for such lenses. The most successful treatment consisted in the application of an extremely thin film of a metallic fluoride. Cartwright described the treatment of an  $f/2$  lens having ten glass-air surfaces, and claimed that photographs made under controlled conditions before and after treatment showed that the effective speed had been doubled (*Amer. Cinemat.* 21: 215, May, 1940). This was confirmed by Miller with lenses in use at the Paramount studios in Hollywood, California (*J. Soc. Mot. Pict. Eng.* 35: 3, July, 1940). Two of the largest lenses known to have been coated were the  $4\frac{1}{2}$ -inch focus apochromat Artar lenses used by the eclipse expedition to Patos, Brazil, of the National Geographic Society (*Phot. Dealer*, Hollywood, 5: 557, Sept., 1940).

An aspherical condenser lens made of the laminated plastic, "Lucite" was demonstrated at the Kodak Research Laboratories in October. It is 16 inches in diameter and was used to illuminate large Kodachrome transparencies when making color separation negatives for photomechanical reproduction.

Lenses for amateur motion picture equipment (16-mm. and 8-mm.) both for cameras and projectors were discussed by Kingslake (*J. Soc. Mot. Pict. Eng.* 34: 76, Jan., 1940). The design of wide aperture objectives was also considered by the same investigator (*J. Applied Physics* 11: 56, Jan., 1940).

An integrating exposure-meter was described by Michaelson for compensating light-intensity fluctuations by varying the time of exposure automatically (*Photo Technique* 2: 43, Feb., 1940). Another unusual type of exposure-meter incorporated a photometer principle that enabled the user to measure the light on an entire scene or a portion of the scene from the camera position. An optical viewer permitted a view of the object being photographed (*Camera Craft* 47: 259, May, 1940).

Several new amateur film developing tanks were offered to the market having as features: Adjustable cores for various sizes of film; stirring agitators; daylight loading; and a cutting blade for severing the film to permit development of a portion of a roll. One new type of enlarging equipment featured a variographic device for altering linear perspective (*Business Week*, p. 52, Sept. 7, 1940). A comprehensive review of the design prin-

ciples of miniature enlargers was given by Simmon (*U.S. Camera* 1: No. 8, p. 76, Feb.-Mar., 1940).

A completely modernized Edgerton lamp for ultra-speed photography was introduced which incorporated an improved electrical circuit and new safety features. The new lamp utilized a long-life gas-filled flash-tube which gave extremely bright flashes of an effective duration of  $\frac{1}{80,000}$  second. The unit was intended for commercial, portrait, illustrative, news, medical, and technical photography (*Photo Art Monthly* 8: 552, Oct., 1940).

A special printer for aerial film used a large number of Argon glow lamps ( $2\frac{1}{2}$  watts) to provide low heat, small electricity consumption, and long service life. Prints were made from single negatives or rolls (*Aero Digest* 36: 144, June, 1940). An improved type of stereomap plotter was constructed by Colonel Bagley of the Harvard School of Geographical Exploration for the training of student explorers. With the device, it was stated that an accurate scale map could be plotted from a photograph in an hour (*Photo Technique* 2: 75, July, 1940).

A radio facsimile equipment for the British air force was demonstrated at the Bendix, N.J., airport in October. Three stations were set up, one in a plane, one in a ground trailer, and one in the airport hangar. With the equipment, photographs, and printed and handwritten messages could be sent as well as received. A receiving rate of 100 words per minute was said to have been obtained (*Business Week*, p. 22, Oct. 12, 1940).

Several improved types of amateur motion-picture equipment were introduced during the year, including cameras and projectors for 16-mm. and 8-mm. film. A growing trend was noted in the use of 8-mm. film and a magazine-loading 8-mm. camera was introduced, which represented the ultimate to date in compactness of motion-picture design. A new 16-mm. sound projector was marketed, and a three-dimensional projector for 16-mm. sound films was introduced. Details of the design of a reliable shutter for an x-ray beam which would accommodate a beam directed anywhere between the vertical and the horizontal were given by Seemann and Vaeth (*Brit. J. Radiol.* 13: 149, May, 1940).

**The Photographic Process.** One of the most significant contributions to photographic knowledge that had been published in many years was the announcement by Crabtree, Eaton, and Muehler that a method had been worked out for the removal of the last traces of hypo from photographic images. This had long been recognized as a difficult problem, especially with photographic papers, as it was known that subsequent decomposition of retained hypo caused fading or yellowing of the silver image due to the formation of silver sulphide. With prints that are to be stored for record purposes, fading may cause obliteration of useful details. The treatment consisted in bathing the washed print or film in a dilute peroxide-ammonia solution which changes the hypo to soluble sodium sulphate which can be washed out easily. Fading of prints by external agents, such as sulphur vapors and coal gases can be minimized by another treatment whereby an extremely thin layer of gold is deposited on the silver grains when the print is bathed in a gold-sulphocyanide solution. For greatest permanency, photographic prints should be given the following treatments: (1) fixed in two fixing baths; (2) washed carefully with a deflected stream of water; (3) bathed in the hypo eliminator solution; (4) treated in the gold protective solu-

tion; (5) dry-mounted on good quality cardboard; and (6) lacquered over the image (*J. Phot. Soc. Amer.* 6: 6, Oct., 1940).

Very rapid processing of photographic papers for mass production was claimed to be possible according to Schaum and Weyde with a new paper called Copex-Autorapid. The paper contained the developing agent and stabilizing materials and after exposure could be developed in 3 to 5 seconds in a solution of 1½ per cent sodium hydroxide with 4 per cent sodium sulphite (*Veröffentl. wiss. Zentral-Lab. phot. Abt., Afga* 6: 198, 1939).

In recent years, James contributed several papers on the theory of development, a subject on which information had been quite meager. These papers and several others were summarized in a general discussion by him under the title "Some Experimental Bases for the Development Process" (*Photo Technique* 2: 54, Dec., 1940). The surface conditions of silver halides and the rate of reaction also were discussed by James in a series of articles (*J. Amer. Chem. Soc.* 62: 536, Mar., 1940). Burki and Ostwalt published an extensive paper on the determination of the hydrogen-ion concentration in photographic developers and its relation to the rate of development (*Helv. Chim. Acta*, 22: 30, 1939).

As a result of a study of the effect of aeration on the photographic properties of developers, Crabtree and Schwingel concluded that very constant developing conditions could be maintained when air agitation is used in a processing machine provided the developer was replenished suitably (*J. Soc. Mot. Pict. Eng.* 34: 375, Apr., 1940). Details of an air agitation device installed in a vertical rack-type developing machine were described by Ives and Kunz (*J. Soc. Mot. Pict. Eng.* 34: 364, Apr., 1940). An analysis of the problem of reversal processing of film was made by Coenen and practical instructions were published for 16-mm. and 8-mm. amateur cine films (*Photo Technique* 2: 28, Dec., 1940).

Volumetric procedures for the qualitative and quantitative determination of the usual constituents of photographic developers and fixing baths were discussed by Atkinson and Shaner (*J. Soc. Mot. Pict. Eng.* 34: 485, May, 1940). The analysis of fixing solutions was also discussed by a Russian investigator, Kirillof, who claimed that his method was simple and rapid enough for commercial use (*Kino Photo Chem. Ind. U.S.S.R.* No. 11-12, p. 97, 1939). It was reported that the recovery of silver residues on a national scale for all users of photographic fixing solutions had been established in Germany (*Brit. J. Phot.* 87: 27, Jan. 19, 1940).

Sustained interest in the use of toning processes for prints was evident by the number of such prints that were exhibited in salons and the announcement of proprietary solutions for toning. One firm introduced complete equipment for color toning with coupler developer dyes which gave six distinct hues (*Commercial Phot.* 15: 484, Aug., 1940). Direct development of sepia tones by the use of a benzoquinone solution without intermediate bleaching was suggested by Seyewetz (*Brit. J. Phot.* 87: 116, Mar. 8, 1940).

A useful reference article was published on twenty-one special photographic effects which are observed occasionally on films and papers (*Photo Technique* 2: 48, Feb., 1940). Several useful practical accounts were published on the design of dark-rooms (Parker—*J. Phot. Soc. Amer.* 6: 9, Jan., 1940; *Photo Technique* 2: 12, Feb., 1940; *ibid.* 2: 14, Apr., 1940; 2: 49, June, 1940).

Domestic production of hydroquinone for photographic purposes was reported to have more than

doubled since 1933 when 600,000 lb. were manufactured compared with 1,400,000 lb. in 1939. See ELECTRICAL INDUSTRIES under X-RAY; CHEMISTRY.

**Bibliography.** Shipment of magazines and books from Europe was slowed up appreciably and in the case of some countries almost cut off, although German scientific literature was shipped by way of Siberia and Japan during the latter half of the year. Most photographic journals continued publication but some reduced their schedule considerably. *Photo Art Monthly* (San Francisco) suspended publication with the December issue. A biweekly called *Photonews* was launched at Washington in February. It contained descriptions of new apparatus, news notes, and an occasional article. Information on the location and an approximate inventory of the contents of the principle photographic libraries of the world was published by Garvin (*Amer. Phot.* 34: 428, June, 1940).

The more notable books of the year were:

P. E. Boucher, *Fundamentals of Photography* (Van Nostrand Co., N.Y.); B. W. Leyson, *Photographic Occupations* (Dutton & Co., N.Y.); J. H. Gable, *Complete Introduction to Photography* (Harper & Bros., N.Y.); G. G. Quarles, *Elementary Photography* (McGraw-Hill, N.Y.); L. A. Lucas and B. Dudley, *Making Your Photographs Effective* (McGraw-Hill, N.Y.); F. K. Turner, *Photographic Exposure* (Fitzman & Sons, Ltd., London); F. Outerbridge, *Photographing in Color* (Random House, N.Y.); I. Dmitri, *Kodachrome and How to Use It* (Simon & Schuster, N.Y.); F. C. Abel, *Portrait Photography as a Career* (Amer. Photo. Pub. Co., Boston); C. Jacobson, *Developing* (Focal Press, London); L. Vitray, J. Mills, Jr., and R. Ellard, *Pictorial Journalism* (McGraw-Hill, N.Y.); W. D. Morgan and H. M. Lester, *Graphic Graflex Photography* (Morgan & Lester, N.Y.); W. Mortenson, *Mortenson on the Negative* (Camera Craft Pub. Co., San Francisco); E. J. GLENN E. MATTHEWS.

**PHYSICS.** Though it is unsafe to predict, it is likely that the year 1940 will be remembered in physics principally as the one which brought an important step toward the ultimate achievement of power from atoms.

**Atomic Energy.** As explained in more detail in the 1939 YEAR BOOK, pp 123 and 621, it was found that neutrons (atomic particles without electrical charge) have the power of causing fission, or splitting, of uranium atomic nuclei. There is an explosion into two different atoms, such as krypton and barium, which have kinetic energies of about 175,000,000 electron volts, resulting from the conversion of part of the mass of the original atom. This energy is far greater than that of the neutron which produces the effect.

It was also established that in the process additional neutrons are given off, and hence the possibility was seen of a "chain" process. That is, one neutron, from a cyclotron or other source, would start the fission of one uranium nucleus. This would divide, yielding energy, and another neutron which could set up fission in another nucleus, and so on. However, when it was tried with uranium, no such effect took place.

In explanation it was suggested that the fission was due to only one form, or isotope, of uranium. Like all the elements, uranium consists of several of these chemical "twins" which have the same chemical properties, but different atomic weights.

The atomic weight of ordinary uranium is given as 238.07 times that of hydrogen. Most of it is an isotope of weight 238, but for every 139 grams of this there is one gram of an isotope of weight 235. Still rarer is isotope 234, one gram of which is present in 17,000 grams of common uranium. Fission was attributed to U-235, the U-238 apparently inhibiting the process, while the amount of U-234 is so minute that its effect is presumably negligible.

Though this had been predicted theoretically, no U-235 had been isolated to test the process, but this was done early in 1940. First to obtain it was Dr. A. O. Nier, of the University of Minnesota, but a somewhat larger sample was obtained shortly afterwards by Drs. K. H. Kingdon and H. C. Pollock, in the research laboratory of the General Electric Co.

In both laboratories, the material was secured with a mass spectrometer. The compound uranium tetrachloride is vaporized by heating to several hundred degrees. After the vapor passes through a tiny slit, it is bombarded by a beam of electrons to break its atoms into ions. The whole apparatus is enclosed in a magnetic field. This bends the stream of ions in a semicircle, which is smaller the less their mass. Thus, the different isotopes are sorted out and collected on platinum plates at the end of a copper tube.

Such isolation of uranium 235 is extremely slow, tedious, and costly both in time and effort. Figures discussed by Dr. Kingdon suggest that more than a million years would be needed to secure a pound with the mass spectrometer, and at least a pound would be needed for a real test of the energy-releasing chain reaction. He estimated, however, that several million times as much power could be obtained from a pound of U-235 as from a pound of coal.

Prof. Niels Bohr, Danish physicist temporarily in the United States, and Dr. John A. Wheeler, of Princeton University, had predicted that while high energy neutrons would be capable of splitting U-238 atoms, very weakly energetic, slow neutrons would produce the effect in U-235 atoms.

Though the amounts of U-235 isolated were of the order of a hundred millionth of a gram, they were enough to permit a test of this prediction. It was made at Columbia University by Drs. J. R. Dunning, E. T. Booth, and A. V. Grosse. Using the cyclotron as a source of neutron bombardment, the Bohr-Wheeler prediction was verified. The U-235 atom, it was determined, was responsible for the fission, and it was split more easily by the slow neutrons. A fast neutron may go straight through the atom without producing an effect, but the slower one seems more easily to be drawn in to the nucleus. A U-235 nucleus is about 500 times as easy to hit as one of the 238 isotope.

It has been suggested that in production of power from U-235 a chunk of the material could be immersed in water. A source of slow neutrons, such as radium in paraffin, could start the process. The neutrons given off in the atomic fission would then be slowed by the surrounding water, which would be heated and converted to useful steam. Removing the U-235 from the water, further neutrons emitted would, presumably, be too fast to cause fission, and the process would stop.

After the first announcements early in 1940, a veil of secrecy was wrapped around most of the further work on uranium fission. Reports reached the United States of intensive researches in Germany and Allied nations. Professor Bohr had re-

turned to his laboratory in Copenhagen before the Nazi occupation of Denmark. Also, physicists in Norway and France had been conducting such studies before the conquest of these countries.

Despite the self-imposed secrecy in the United States, and the censorship in Europe, certain advances were revealed. In a communication to *Nature* (London) Prof. Wilhelm Krasny-Ergen, of the Wenner-Grens Institute of the University of Stockholm, told of a means of concentrating U-235 at a rate more than 11,000 times as rapidly as with the mass spectrometer. This made use of the method of thermal diffusion, which was developed in 1938 by Clusius and Dickel in Germany and by Brewer and Bramley in the United States. In this method of separating isotopes the fluid (for it works for either a gas or a liquid) passes along concentric cylinders. The outer cylinder is cooled with water or air while the inner cylinder is heated from the inside by a hot wire. With tubes about 30 feet high, and using the gaseous compound, uranium hexafluoride, Professor Krasny-Ergen was on the verge of concentrating the rare material. Work had to be suspended when Germany marched into Norway, Sweden's neighbor. The 24-hour yield of rare uranium 235, he estimated, would be 1.3 milligrams per day. This means that with a single tube in his thermal diffusion apparatus, Professor Krasny-Ergen would require about three years to get a gram of uranium 235. It is about 12,000 times as fast as with the mass-spectrometer.

Another possible means of separating the isotope appears to be with the ultra-centrifuge, with which Prof. J. W. Beams, of the University of Virginia, has been one of the chief experimenters. This works on a principle similar to that of a cream separator. When fluid uranium compounds are placed in a cylinder rotating at high speed—some 66,000 revolutions per minute—heavy 238 atoms are thrown to the outside, while the lighter 235 atoms gather near the center. Since the cylinder must be several inches in diameter, great technical problems are encountered in its construction and operation.

It also seems possible that zeolites—silicates of aluminum, calcium, and sodium used in water softening—might be used to accomplish the isolation of U-235. A patent covering the separation of isotopes with zeolites (United States 2,204,072) was granted in June to Dr. John G. Dean, research director of the Permutit Company.

Another way to split the uranium atom with release of energy was reported from the Westinghouse Research Laboratories. Gamma rays, generated by proton bombardment of fluorite with the 95-ton electrostatic atom smasher, are found to split the uranium nucleus, releasing 30 to 100 times the energy expended in causing the fission. Since gamma rays are radiation—like electricity, light, and X-rays—consisting of photons, Dr. E. U. Condon, Westinghouse's associate research director, suggested in announcing the discovery that the new uranium fission phenomenon be called "phission."

Whether the new photo-fission or "phission" of uranium will bring closer to realization the actual release of atomic energy is problematical. The big task is still the concentration of enough uranium 235 to provide a real test as to whether there is a chain reaction.

The new research has provided an alternate method of starting the disintegration. The form of radiant energy used is 6,000,000 electron-volt

gamma rays, similar to but more penetrating than X-rays. Details of the research were given in a letter to the *Physical Review* communicated by Drs. R. O. Haxby, W. E. Shoupp, W. E. Stephens, and W. H. Wells.

Atomic power is released from uranium spontaneously without atom-smashing bombardment with neutrons, two Leningrad physicists reported in the *Physical Review*. But the observations of the two Soviet scientists, Flerov and Petrjak, hold out no hope that there will be any practical utilization of this energy from the splitting of the uranium atom. Only six fissions an hour were discovered.

Possibility that the energy yield from U-235, may be greater than hitherto supposed, was suggested by Dr. R. D. Present, of Purdue University. Speaking before the American Physical Society, he stated that it is theoretically possible for the nucleus of the uranium atom to divide into three parts as well as two. Such a reaction would yield about 10 per cent more energy, according to his calculations, than binary fission. Though the energy to activate the process is the same as for binary fission, he believes that, with low energy neutrons, it is less likely to occur than division into two parts. So far no experimental verification of the triple division has been found.

**High Speed Rotation.** Dr. L. E. MacHattie, of the University of Virginia, stated at the same meeting that by magnetically suspending a steel ball  $\frac{1}{32}$  inch in diameter in a vacuum, so that friction was nearly eliminated, he was able to spin it 110,000 times per second, about 2600 times as rapidly as the propeller of a pursuit airplane, which revolves at about 2500 revolutions per minute. In some researches, a rapidly rotating mirror is needed. To test the feasibility of such a use of the device, two flat faces were ground on the ball. Then it was spun to more than 100,000 revolutions per second without bursting. In another test a drill rod  $\frac{1}{16}$  inch diameter and  $\frac{7}{8}$  inch long, was spun at 36,000 revolutions per second, before it was bent double.

Dr. J. W. Beams, head of the University of Virginia's Rouss Physical Laboratory, reported researches with Arthur L. Stauffacher and L. B. Snoddy, showing how the ultra-centrifuge could be used to determine molecular weights of various compounds.

**High Pressures.** New world's record high pressures, as much as 3,500,000 lb. per square inch, were achieved by Dr. P. W. Bridgman in Harvard's Physics Laboratories through use of nests of high pressure vessels in which inside apparatus receives outside support at critical parts. A piece of tool alloy, Carboloy, composed of tungsten carbide and cobalt, was subjected to a compressive stress of between 200,000 kilograms per square centimeter (2,800,000 lb. per square inch) and 250,000 kg. per sq. cm. (3,500,000 lb. per sq. in.) without fracture. Carboloy's crushing strength under normal conditions is not more than 70,000 kg. per sq. cm. (1,000,000 lb. per sq. in.). The confining pressure that made possible these new high pressures was about 25,000 kg. per sq. cm. (350,000 lb. per sq. in.). See CHEMISTRY.

Dr. Bridgman, in reporting his results to the *Physical Review*, also made known that under such extreme pressures, carbon in the form of a thin plate of crystal graphite is not converted to diamond at room temperature. Both graphite and diamond are carbon. There had been hope that pressure alone might cause the formation of dia-

mond out of the other form of carbon. It is probable that no pressure, however high, will accomplish the conversion at room temperature. Doubling of the pressure apparatus, as practised by Bridgman, made it possible to reach pressure considerably more than double because of the increase in intrinsic strength under hydrostatic pressure. A striking effect of the extreme high pressures on Carboloy was that, although under normal conditions it is highly brittle and breaks with practically no plastic deformation, under the confining pressures used by Dr. Bridgman the piston of this tough material was plastically and permanently shortened by 5.5 per cent with no perceptible cracks.

Similar experiments were carried out by Dr. Roy W. Goranson and Ellis Johnson, of the Department of Terrestrial Magnetism of the Carnegie Institution of Washington, in an effort to reproduce pressures that exist hundreds of miles below the earth's surface. They announced that pressures of 3,000,000 lb. per square inch had been attained. They stopped at this figure because the pressure gauge was not calibrated beyond that point. The pressure equipment itself potentially may be capable of doubling this pressure. If this can be done, it will produce a pressure equal to that inside the earth at depths of 745 miles and permit important studies of the properties of matter at these pressures. Dr. Goranson and Mr. Johnson, in their tests, used ordinary table salt, sodium chloride. They found that at the extreme pressure it was squeezed so tightly its volume was decreased by 20 per cent, or one-fifth. This means, it is explained, "that the space inside the sodium chloride molecule was mostly eliminated by the pressure, so that the atoms making up the molecules of salt actually, or nearly, touched one another." Unlike some other chemical substances which have been studied under high pressures previously, the salt used in the Carnegie tests appeared to have suffered no color or structural change.

**Cyclotrons.** By a grant of \$1,150,000 from the Rockefeller Foundation, supplemented with \$250,000 raised by the University of California, work was begun at the University, in Berkeley, on a cyclotron, or atom smasher, with a magnet 184 inches in diameter, weighing 4900 tons and including more than 400 tons of copper windings. This will far surpass the 60-inch cyclotron, also at Berkeley, which is now the world's largest. At the end of 1940, Dr. Ernest O. Lawrence, inventor of the cyclotron (which obtains high energy deuterons, or hearts of hydrogen atoms, by whirling them around and around in a strong magnetic field), reported that construction was well under way and that it would probably be in operation by 1943. He suggested that it might possibly give energies as high as 200,000,000 volts, and enable scientists to find things not even found in the cosmic rays. The new cyclotron will be able, he said, to make in one minute enough radioactive sodium to equal in effect 350 grams of radium, more than there is in the world, and costing \$10,000,000 if it could be produced. Construction of new cyclotrons was also started at the University of Pennsylvania, the University of Illinois, and elsewhere. Professor Lawrence estimates that there are more than 30 in the world either in operation or being built.

Mainly with the use of cyclotron, radioactive isotopes of all the elements have been obtained, though some are very short-lived. Dr. Charles Fecher, working in the Crocker Radiation Labo-

ratory at the University of California, reported preparation of radioactive yttrium, which lasts about 100 days, yielding gamma radiation capable of penetrating two inches of iron. He suggested that this might become a substitute for radium in taking gamma-ray photographs of machine parts to search for internal flaws.

Such artificial production of substances like radium, was covered in U S Patent 2,206,634, granted to a quintet of Italian physicists, who were at the University of Rome when application was made for the patent, Oct. 3, 1935. They are Dr. Enrico Fermi, now at Columbia University, New York City; Edoardo Amaldi, still in Rome; Emilio Segre, University of California; Franco Rasetti, Quebec, and Bruno Pontecorvo, now in South America. The patent was assigned to G. M. Gianini and Co., Inc., New York City.

Neutrons from the cyclotron have too high energy, so Dr. Fermi's problem was to slow them. "We have found it possible to achieve the desired results by passing the neutron radiation against or through a screen of a suitable material," states the patent. "The materials which have been found best suited to this purpose are those containing hydrogen (including all its isotopes, but the light isotope which predominates in natural occurrence being most efficient) and especially water and the hydrocarbons, such as paraffin for example." In use, the screen may be either solid or liquid. In the latter event, the material to be treated can be dissolved or suspended in the liquid itself. The new patent covers the use of neutrons, with such an energy reducing screen and the production of radioactive isotopes thereby. Since this is so far the most satisfactory method of producing artificial radioactive substances, and these have begun to find medical use, the patent seems to be quite basic.

However, high voltage X-rays can also be used to produce artificial radioactivity, Dr. Robert J. Van De Graaff, Dr. Lester C. Van Atta, Dr. Chester M. Van Atta, and Doyle L. Northrup, of Massachusetts Institute of Technology, reported, confirming earlier findings of Notre Dame University physicists. They found that X-rays, produced with the electrostatic generator operating at a little under 1,000,000 volts, formed three radioactive isotopes of indium, with half life periods ranging from 12 seconds to four hours.

**Cosmic Rays.** The minute particles known as mesotrons, which are formed high in the air when the atmospheric atoms are struck by cosmic rays from outer space, die for the most part before they reach the ground. New evidence of this rapid decay was obtained by Dr. R. A. Millikan of the California Institute of Technology, in collaboration with Dr. H. V. Neher and Dr. H. G. Stever. Mesotrons are similar to electrons, but about 150 times heavier. They start with a speed of some 180,000 miles per second, nearly as great as that of light. Yet, so short-lived are they, that in traveling 12,000 feet, about 15 per cent disintegrate spontaneously. From this it is calculated that they live, on the average, about 66 millionths of a second. In accordance with one of the consequences of the theory of relativity, an object moving at such a high speed shows a longer life than if it were at rest. The life of the mesotron at rest is calculated to be only 2.5 millionths of a second.

The scientists measured the intensity of the cosmic ray effects in two mountain lakes, one about 12,000 feet higher than the other, yet geographically close. In the upper lake, the apparatus was immersed about 12 feet deeper, so as to compensate

for the fact that there was less air above this one. Thus, the total combined air and water absorption for each was the same. Despite this, the readings in the lower lake were 15 per cent lower than in the upper one. Dr. Millikan has concluded, therefore, that this is due to the fact that, in the extra time required for the mesotrons to reach the lower level, more have died. A life, at rest, of 2.5 millionths of a second, the same as that obtained theoretically, would give this difference.

Neutrons were also found to be associated with the cosmic radiation, though the exact relationship has not been fully explained. Dr. Serge A. Korff, of the Bartol Research Foundation of the Franklin Institute, designed a new form of counter to measure them, as distinct from the measurements of the other types of cosmic radiation. This consists of a tube containing a gas, boron trifluoride. The neutrons break up the nuclei of the boron atoms, and alpha particles, atomic bullets of another kind, are formed. These are detected in the counter. Such a counter was taken by Dana Bailey, of the Harvard College Observatory, to Little America, to make observations that may tell whether there is a latitude effect with the neutrons. Two sensitive cosmic ray meters of the Millikan type have been in use at Little America since January, 1940, and are expected, when brought back about April, 1941, to yield important data concerning the cosmic radiation.

During the summer, a high altitude laboratory for cosmic ray research, under the direction of Dr. Bruno Rossi, was established by the University of Chicago on Mt. Evans, Colorado, at 14,259 feet altitude. Robot balloon flights which carried an ionization chamber to heights of 15.5 miles have disclosed that after correction for the effects of variations in the earth's magnetic field, the maximum of cosmic ray intensity in the upper air comes in the springtime, Dr. William P. Jesse of the University of Chicago found. He said that more work will be needed before it can be proved that the spring maximum in cosmic ray intensity is a true seasonal effect. The unmanned balloon flights were primarily directed to determine whether cosmic ray intensities at the top of the atmosphere varied with time. Changes of more than 15 per cent were observed which appear to follow the "world-wide" variations previously reported by other investigators from ground stations. It appears that the 15 per cent changes at the top of the atmosphere are due to a large extent to intensity change in the magnetic field surrounding the earth.

Drs. Marcel Schein and E. O. Wollan studied the production of mesotrons at high altitudes, and found that mesotrons began to be generated in a lead block carried aloft when an altitude of about 4 miles was reached. Dr. G. Herzog, also of the University of Chicago, has investigated slow mesotrons with a Wilson cloud chamber apparatus to take pictures of their tracks up to altitudes of 29,000 feet in airplane flights.

**Instruments.** In the instrumental field, an important event was the commercial production of an electron microscope by the Radio Corporation of America, which, as noted in the 1939 YEAR BOOK, p. 122, permits direct magnifications of as much as 25,000 diameters. With such an instrument, it was found possible to photograph certain large organic molecules. Similar success in photographing actual molecules with the electron microscope was reported from Germany.

A device for producing intense bombardments with fragments of atoms, called the induction elec-

tron accelerator, was described by Dr. D. W. Kerst of the General Electric Research Laboratory. The electron accelerator consists of a doughnut-shaped glass vessel with the air pumped out of it. It contains an iron core, and is surrounded by a magnet consisting of thousands of segments of iron. A stream of electrons introduced into the glass vacuum chamber is whirled in the magnetic field at ever-increasing velocities until the particles are finally moving at almost the speed of light—186,000 miles a second. In reaching this speed, the electrons make 200,000 revolutions, traveling a distance of approximately 60 miles and building up an energy of 2,300,000 volts. The present small apparatus, less than a foot in diameter, produces radiation energy equivalent in intensity to that given off by ten milligrams of radium. Larger models can be expected to give more energy.

**PLANNING.** In the United States at the close of 1940, The National Resources Planning Board was completing a report on a Program for the Development of Resources and Stabilization of Employment. This includes a six-year Public Works Program for Federal Agencies, National water, land, and transportation policies, and plans for regional development. Another report will deal with long-range work and relief policies. Plans for national defense were being studied. A national roster of scientific and specialized personnel was being prepared. Locations for critical industries were under consideration. The board has regional offices at Boston, Baltimore, Atlanta, Indianapolis, Dallas, Omaha, Denver, Berkeley, Portland, Ore., and Juneau, Alaska. These co-operate with regional, state, and local planning bodies.

A tentative fourfold master plan for New York City was announced late in the year by the City Planning Commission. An immense wall map was put on exhibit and a series of descriptive pam-

phlets made available. A "highway pattern" shows 96 proposed express highways and 26 express parkways, besides major streets. Many of these are in existence; others were added or amended routes. Three other elements of the master plan are land use, parks, and public schools. At Baltimore, a board of three advisory engineers will report to the City Plan Commission a program for water supply, sewers and sewage disposal, garbage and refuse disposal, park and recreational areas, and schools, each and all to fit into a master city plan and serve as a basis for long-range capital budgeting. The Chicago City Plan Commission, an official body of 25 members, was organized in June to succeed the voluntary body of 300 members which, with expert aid, formulated the well-known Chicago Plan. This plan and successive elaborations have been approved by referendum vote from time to time and executed by the city government. One of the first tasks of the new commission will be to rezone Chicago, using as a basis a \$2,000,000 WPA land-use map made under the direction of its predecessor.

At Seaford, Del., Baltimore consulting engineers are studying the effect of the large Nylon plant on a small town. Under consideration are new streets, extension of utilities, and a new city charter. The du Pont and the city officials are co-operating. Four small communities in as many states have been or are being moved to new and carefully planned sites: Hill, N.H., and Greenville, Mo., are to move to higher ground to get out of areas to be submerged by flood-control reservoirs. Leavenworth, Ind., and Shawneetown, Ill., have moved from locations that were covered by Ohio River flood waters of 1937. The Indiana village had been flooded 11 times. (See *Engineering News-Record*, Mar. 14, 1940.)

The first of three articles on Planning Progress in Baltic Countries, dealing in some detail with Stockholm, Helsingfors, Gdynia, and other cities, appeared in the July-September issue of *The Planner's Journal* (Cambridge, Mass.). Since the cessation of hostilities between Russia and Finland the Finnish government has made plans for building four new towns.

A vital factor in planning activities that must be reckoned with was revealed by the United States Census of 1940. It showed that the number of cities having a population of 100,000 or more was 90 compared with 92 in 1930, and that a third of the 90 cities had declined in total population while many others had barely held their own, and only a fifth of the total showed increases of more than 10 per cent. Nearly a fourth of the cities having 25,000 or more population in 1940 had fewer inhabitants than in 1930. These and other declines in population and in percentage rates of growth must be considered in planning extensions of streets, water supplies, and other public works, as well as educational facilities and industrial activities. Such declines, besides their effects on public needs, upset vital and other statistics based on population estimates for intercensal years. They emphasize the need for population counts oftener than once in ten years, whether the population is increasing or decreasing rapidly. **PLATINUM**. Except for iridium, prices for the platinum metals were relatively stable in 1940. The price of platinum ranged from \$36 to \$38 per oz. Iridium was quoted at \$175 per oz. at the beginning of the year, and in excess of \$275 at the year end. Palladium was unchanged at \$24 an oz., rhodium at \$125, and ruthenium at \$35 to \$40. World production data are not available, but it is known that International Nickel Company, Canada, continued to be the largest producer. According to the U.S. Geological Survey, 1940, the Alaska production was 28,860 fine oz., having a value of approximately \$1,092,000. The bulk of this production comes from the Goodnews District in South Western Alaska, where the deposits are mined by dredge and dragline. Platinum and its related metals find extensive use in the chemical industry; also in the production of rayon, and in contacts for the electrical and aviation industries. Platinum continued to find continued use in jewelry, and palladium in dentistry as an alloy with gold.

**POLAND**. A central European republic, established Nov. 9, 1918, and partitioned between Germany and the Union of Soviet Socialist Republics by the treaty of Sept. 28, 1939. Warsaw, capital of the republic, surrendered to the Germans Sept. 27, 1939. See 1939 YEAR BOOK, p. 625 f., for data on Poland prior to its partition.

**The Partition**. At the outbreak of the war with Germany on Sept. 1, 1939, Poland had an area of 151,100 square miles and a population of 35,500,000, according to official Polish statistics. By the German-Russian treaty of Sept. 28, 1939, Germany occupied the western sector of 72,432 square miles with about 22,000,000 inhabitants, predominantly Polish, and Russia the eastern sector of 78,400 square miles with approximately 13,500,000 inhabitants, mostly Ukrainians and White Russians. See map in YEAR BOOK, 1939, p. 626.

A German decree of Oct. 8, 1939, incorporated in the Reich about 35,512 square miles of Polish territory with a population of about 9,627,000. This area comprised the Polish provinces of Pomorze, Poznan, and Upper Silesia, which were ceded by Germany to Poland under the Treaty of Versailles, and the additional Polish districts of Suwalki, Ciechanow, Plock, Wloclawek, Kutno, Lodz, Konin, Kalisz, Bedzin, Sosnowiec, Biala, and Zywiec. Of

the remaining German-occupied territory, an area of 225 square miles with some 45,000 inhabitants was transferred to Slovakia on Oct. 21, 1939. The rest—an estimated 36,921 square miles with a population variously estimated at 10,500,000 to 14,500,000—was created a separate German-controlled territory known as the Government-General of Poland, with its capital at Cracow.

On Oct. 10, 1939, the Soviet Government ceded to Lithuania part of the Vilna district taken from Poland—an area of 2570 square miles with 457,500 inhabitants. The remainder of Soviet-occupied Poland—about 77,703 square miles with 11,924,000 inhabitants—was incorporated in the Soviet Union by vote of the Soviet Supreme Council (Nov. 1-2, 1939). According to Soviet figures, 41,650 square miles with a population of some 8,000,000 was annexed to the Ukrainian Soviet Socialist Republic and 34,000 square miles with about 4,800,000 inhabitants to the White (Byelo) Russian Soviet Socialist Republic. See LITHUANIA, GERMANY, and UNION OF SOVIET SOCIALIST REPUBLICS.

**Government-in-Exile**. The Polish Government-in-Exile established a temporary capital in Paris on Sept. 30, 1939; it was transferred to a site near Angers, France, on Nov. 22, 1939. President of the republic, Wladyslaw Raczekiewicz, who was appointed by President Ignace Moscicki upon the latter's resignation, Sept. 30, 1939. (The Polish Constitution empowered the retiring President to name his successor.) Premier and War Minister, Gen. Wladyslaw Sikorski, heading a non-party cabinet formed Sept. 30, 1939, as follows: Foreign Affairs, August Zaleski; Finance, Henryk Strasburger; Public Welfare, Jan Stanszyk; Ministers without Portfolio, Gen. Kazimierz Sosnkowski, Prof. Stanislaw Kot, A. Lados, Stanislaw Stronski, Marian Seyda, and Gen. J. Haller.

The Polish Parliament was dissolved by Presidential decree in November, 1939, and the appointment of a National Council to function as a wartime parliament was authorized Dec. 19, 1939. The 16 members of the National Council appointed in January, 1940, were as follows, with the groups they represented in parentheses: Ignace Jan Paderewski, President of the National Council; Stanislaw Mikolajczyk and M. Jozwiak (Peasant party), Dr. Herman Lieberman (Socialist party), Dr. Tadeusz Bielecki (National Democratic party), Father Jan Brandys and Arkadiusz Bozek (Upper Silesia), Bishop Jozef Gawlina (Roman Catholic Church), Gen. Lucjan Zeligowski and Stanislaw Mackiewicz (Vilna), Dr. Jan Jaworski (Conservative party), Tytus Filipowicz (Polish Democrats), Mme. Zofia Zaleska (Polish women), M. Schwarzbart (Polish Jews), Dr. Zygmunt Nowakowski (Polish intellectuals), M. Kwiatkowski (Polish emigrés in France).

**Provisional Parliament Meets**. The National Council held its first meeting in the Polish Embassy in Paris on Jan. 23, 1940. President Raczekiewicz, opening the session, pointed out that the Council, like the cabinet and himself, were only wartime representatives of the nation and that a new government would be organized when peace was restored. He outlined the National Council's tasks as voting the budget, advising the government, and drawing up Poland's objectives for a prospective peace conference. Paderewski in a moving speech affirmed that Poland would live. Both he and Premier Sikorski declared that respect for democratic principles would be the guiding principle of future Polish regimes. The Council took a formal vow of solidarity and warned

Germany and Russia that wrongs inflicted upon conquered Poland would be revenged.

Polish war aims were stated by Premier Sikorski on February 18 to include "complete reparation" and "reconstruction at the expense of the raiders." He called for more secure western frontiers than Poland had before the outbreak of war and said that "access to the Baltic must be larger than before."

The first business session of the National Council was held in Angers commencing March 5. On May 28, at the close of the disastrous Battle of Flanders, the cabinet met in special session in Paris and voted inflexible loyalty to the Allied cause. Other governmental activities included the publication of various documents in support of the Polish struggle for independence. A White Book issued in March, 1940, reviewed the diplomatic antecedents of the war and charged that the Hitler regime over a period of years attempted to lead Poland into a joint war upon the Soviet Union.

**Government Moves to London.** After the defeat and capitulation of France, the government in exile moved at the end of June, 1940, to London. An Anglo-Polish military convention, signed August 5, confirmed the alliance concluded in 1939 and the decision of both governments to continue the struggle until victory was won. Under the accord, British credits and arms were supplied to enable the reorganization of the Polish armed forces as an independent force under its own officers, who in turn were responsible to the British high command. According to a statement by the British Under-Secretary for Foreign Affairs in the House of Commons on August 21, the Polish Government considered itself at war with both Germany and Russia. It did not declare war on Italy but with the consent of their government, Polish troops participated in hostilities against the Italians in Africa and Greece later in the year. Another Polish force was assigned to guard a sector of the Scottish coast against the threatened German invasion.

The Polish and Czecho-Slovak governments in exile on November 11 concluded an agreement for a close postwar political and economic association as the basis of a democratic "new deal" for eastern Europe. See CZECHO-SLOVAKIA under *History*.

**Government-General of Poland.** The Government-General was constituted Oct. 25, 1939, under Hitler's decree of October 11 appointing Dr. Hans Frank, Reich Commissioner of Justice, as Governor-General. While administered and controlled by the Germans, it was not a part of the German Reich. The Government-General was divided into four administrative districts of Cracow, Radom, Warsaw, and Lublin, and these in turn were subdivided into 10 provincial districts. All the districts were placed in charge of German appointees of the Governor-General. In the municipalities, Polish mayors acceptable to the German district leaders were permitted to retain office.

According to Governor-General Frank, the population of the Government-General in March, 1940, was 14,500,000, including 12,000,000 Poles, 2,000,000 Jews, 400,000 Ukrainians, and about 60,000 Germans. He gave populations of the chief cities as follows: Warsaw, about 1,800,000; Cracow, 300,000; Czestochowa, 140,000; Lublin, 140,000. The Jews were concentrated mainly in a reservation south of Lublin. Their numbers were added to during the year by further expulsions of Jews from Vienna, East Prussia, Germany proper, and the German provinces annexed from Poland.

**The Annexed Provinces.** In the Polish provinces annexed as an integral part of Germany, the National Socialist system of government prevailing throughout the Reich was placed in effect. On Feb. 1, 1940, Chancellor Hitler announced that he would appoint one new Reichstag member for every 6000 Germans over the age of 20 in the incorporated provinces.

**German Methods.** The policies of the German conquerors in Poland, described in the 1939 YEAR BOOK, p. 627, were extended during 1940. The objective of the Reich Government in the annexed provinces was set forth by Dr. Robert Ley, Leader of the German Labor Front, in a speech to a German audience at Lodz in January, 1940.

"You must remain hard," he was quoted as saying. "Then the wish of the Fuehrer will be fulfilled, that millions of young Germans will grow up here; that in 50 years this will be a flourishing German farmland in which there will not be a single Pole or Jew."

The Polish Government charged that 1,200,000 Poles were forcibly deported from the annexed provinces to the Government-General of Poland up to Dec. 31, 1939, and that the eviction of over a million more followed during 1940. Still other Poles in the annexed provinces were drafted for labor service in Germany proper. A Berlin decree of Feb. 21, 1940, authorized the government to confiscate all farm lands and all goods in German Poland not in the possession of Germans on Sept. 1, 1939. The lands, businesses, and properties taken from evicted Poles were reported to have been sold by the German Government on a 40-year-payment plan to more than one million Germans settled in the annexed provinces from Soviet Poland, the Government-General of Poland, the Baltic States (Latvia, Estonia, and Lithuania), and Germany proper.

The methods employed by the Germans in their mass expulsion of Poles from the annexed provinces and in administering the Government-General of Poland were described as follows in a joint declaration of the British, French, and Polish Governments issued in London Apr. 17, 1940:

Wholesale executions, deportations in circumstances of most ruthless barbarity of the Polish population . . . settlement of German population in Polish territory, transfer of property belonging to the Poles to these Germans . . . confiscation of State and private property, deportation and forced labor in Germany of young Polish men and women, destruction and pillage of historical and artistic monuments, closing of churches and persecution of religion clearly reveal a policy deliberately aiming at destruction of the Polish nation . . .

This conduct is in flagrant violation of the laws of war, and His Majesty's Government in the United Kingdom, the French Government, and Polish Government desire to make formal and public protest to the conscience of the world against the action of the German Government and of its agents.

They reaffirm the responsibility of Germany for these crimes and their determination to right the wrongs thus inflicted on the Polish people.

These charges were elaborated in a Polish White Book, entitled *The German Effort to Destroy the Polish Nation*, issued by the Polish Government-in-Exile in March, 1940. The allegations were flatly denied by Governor-General Frank in a press interview in Berlin in April (see *Facts in Review*, Apr. 22, 1940, p. 154 f., published by the German Library of Information, New York). But the Polish charges were supported by a memorandum presented to the Pope by Cardinal Hlond, Primate of Poland, and made public by the Vatican on Jan. 28, 1940 (see *New York Times*, Jan. 29-30, 1940, for text). Statements from other neutral sources, espe-

cially from foreign correspondents in Berlin, tended to substantiate the Polish accusations in many respects.

**Nazi Objectives in Annexed Provinces.** According to the Polish Government, the Hlond report, and other sources, Hitler's program called for complete and rapid Germanizing of the annexed provinces through mass deportation or extermination of those Polish elements most likely to preserve and propagate Polish nationalism and culture. These Poles were being replaced with Germans who received extensive State aid in establishing themselves on Polish soil. Poles permitted to remain in the annexed provinces were mainly of the peasant class and they were subjected to forced Germanization. They were not permitted to own land, industries, immovable property, or commercial undertakings. Their children were compelled to attend German schools and join Hitler Youth organizations. The Polish language was forbidden in public and actively discouraged in private.

Many important Polish industries in the Government-General of Poland were transferred to Germans and moved to the annexed provinces, it was charged. To develop trade between Germany proper and the annexed provinces, the Reich Government in April organized a large company (*Handelsaufbau Ost G.m.B.H.*), which established branches in the chief cities of the new provinces. It was announced that the great German network of super highways would be extended to the principal centers of these provinces and of the Polish Government-General.

**Policy in Government-General.** In the Government-General, German policy appeared to aim at the repression of Polish national consciousness and limited Germanization of Poles to permit the economic exploitation of the Polish and Jewish masses by Germans, aided by a new pro-German Polish administrative class, on behalf of the Nazi party and the Reich. According to Governor-General Frank, progress was made during 1940 in rehabilitating Polish workers and peasants, reviving industry, increasing agricultural and other production, restoring and improving the transportation system, extending education, eliminating disease and hunger, etc. The two former presidents of the Polish State Bank were appointed presidents of a new Central Bank, established in Cracow, that was authorized to issue bank notes to serve as the sole currency in the Government-General.

The other side to the picture was indicated by various measures reported to have been introduced in the Government-General during the year. They included the confiscation of all radio sets owned by Poles; extension of labor service conscription for all Polish youths between 14 and 18; introduction of "Jim Crow" trolley cars, with Poles and Jews forbidden to ride in compartments reserved for Germans; a food control system requiring Polish peasants to turn over part of their production to German authorities and requiring licenses for all grain sales; large-scale drafting of able-bodied adult Poles for labor service in the Reich; restriction of Polish consumption of commodities needed for the German war effort, especially through a petroleum monopoly; greatly increased exploitation of Polish forests, mines, and other natural resources for German use; the expulsion of all foreigners except a few Italians from the Government-General; the establishment of various German-language schools in purely Polish-speaking districts.

In the Government-General, as in the annexed

provinces, continued executions and persecutions of educated Poles were reported. Polish universities remained closed or destroyed and their equipment was said to have been sent to Germany. Dr. Arthur Seyss-Inquart, Deputy Governor of the Government-General, admitted to correspondents in Berlin on Jan. 31, 1940, that some Polish cultural institutions remained closed to prevent their becoming "centers of subversion." Germans arriving in Berlin from the Government-General during the winter of 1939-40 reported that conditions were terrible as a result of war devastation, the continued German-Polish racial conflict, and the near-famine existing during a period of intense cold.

During the winter American Red Cross aid for suffering Poles and Jews was restricted by the refusal of the German authorities to permit American supervision of the distribution of clothing, food, and medicines except in the district around Warsaw. In March, however, an agreement was reached between the American Red Cross and the German Government under which German authorities extended full co-operation in arranging for distribution of relief supplies through Polish and Jewish channels in the occupied regions.

**Situation in Russian Poland.** Comparatively little reliable news of developments in the Soviet-annexed territories escaped the censorship during 1940. In general it appeared that the sovietization of these territories described in the 1939 YEAR BOOK, p. 628, proceeded steadily, but that the Soviet Government avoided the extreme measures resorted to by the Germans in Western Poland. The report of Cardinal Hlond, cited above, stated that in general conditions were better in Soviet Poland than in the German sector. Another report issued by Cardinal Hlond in Rome on Mar. 16, 1940, said that while the Russians avoided massacres and other "barbaric methods," they banned religion from the schools, taught communism and atheism to Polish youth, reduced the Polish clergy to abject poverty, and starved the masses into acceptance of communism. He asserted that the Polish people sought to defend the clergy and the Church by demonstrating against the Soviet authorities and refusing to send their children to Soviet schools.

Reports attributed to Polish and Ukrainian émigrés reaching Rumania from Soviet Poland stated that disorders had occurred in Lwow between Soviet authorities and Ukrainian nationalists in January. The Ukrainian nationalist movement was said to be receiving undercover German support. Later in the spring reports of similar origin indicated that there was a serious food shortage in Soviet Poland and that Soviet authorities were deporting many Poles and Ukrainians, particularly those living along the German and Rumanian frontier districts, into Russia proper. Polish officials in New York estimated deportations during the first year of the Russian occupation at 500,000. There was also carried out an exchange of about 130,000 German-speaking residents of the Soviet-annexed Polish territories for an equal number of Ukrainians and White Russians in German Poland. The exchange was provided for by a Soviet-German agreement signed Nov. 4, 1939, and was completed in the early spring of 1940.

Russian Poland participated in the election of deputies to the Supreme Soviet of the U.S.S.R. and to the Supreme Soviets of the Ukrainian and White Russian Republics on Mar. 24, 1940.

**POLAR RESEARCH.** Antarctic. Public interest during 1940 was principally directed to the progress of the Third Byrd Antarctic Expedition. This ambitious undertaking, financed in part by the U.S. Government, and commanded by Rear Admiral Richard E. Byrd, was organized for the purpose of expanding man's knowledge of the vast southern frigid zone. It comprised 2 ships, 1 naval aircraft, 125 enlisted men, 4 naval officers subordinate to Byrd, and several scientific men. Admiral Byrd sailed from Panama on the *North Star*, a motor-driven vessel of the Coast Guard, in November, 1939, and reached Little America on the following January 11. He there transferred on January 19 to the expedition's sister ship, the brigantine *Bear*, where he made his headquarters thereafter.

Ploughing through a limitless field of ice and snow, and in the face of gales and blizzards, the *Bear* nosed its way over a 1200-mile zigzag course to Lat. 70 degrees 43 minutes S., Long. 108 degrees 25 minutes W. by February 21.

Here open water suitable for a take-off of the plane was found and Admiral Byrd made three notable exploratory flights, on February 21, 22, and 26. The crew of the twin-motored seaplane consisted of the admiral, who served as navigator; Aviation Machinist's Mate Ashley C. Snow, U.S.N., as pilot; and Radioman First Class Earle B. Perce, U.S.N., as co-pilot. They made extensive photographic records of the long-sought south Pacific coast of Antarctica and discovered a great ice-locked sea some 40 or more miles wide, a series

York that unfavorable weather had prevented his flying over the South Pole, and imparted the scientific information that the South Pole magnetic point had shifted westward since his flights over it in 1933-35.

Meanwhile other members of the expedition remained in the Antarctic, 33 at West Base near Little America, and 26 at East Base, 1200 miles away in Palmer Land, the pivot from which the admiral had conducted his 1940 aerial explorations. On June 13 the House of Representatives in Washington refused to appropriate \$250,000 for the continuance of the expedition. Five days later it voted a sum of \$171,000 to defray the cost of the return voyage to the United States.

of mountain peaks that rose as high as 7500 ft., and a vast wind-swept elevated plateau 2000 or 3000 ft. high. In all, the expedition succeeded in discovering and charting 900 miles of previously unknown coastline and 150,000 square miles of territory.

In compliance with Navy Department orders from Washington, Admiral Byrd returned to the United States on May 14. He announced in New

CONGRESS OF INDUSTRIAL ORGANIZATIONS; SOCIALISM; SOCIAL SECURITY BOARD; RELIEF. **POLO.** The retirement of Thomas Hitchcock,

Jr., since 1921 considered, in most years, to be the top player of the game, and the crowning of a new self-made king were two important headlines in the 1940 history of polo. Hitchcock's withdrawal left only two active players holding the top rating of ten goals, Stewart Iglehart and Cecil Smith. When the season ended, it was the general consensus that Smith—a Texas cowboy—was the greatest polo player in America at the present time.

The Aknusti quartet organized by Elbridge T. Gerry and his brother, Robert L. Gerry Jr., captured the major team honors of the sport. With the veteran, Gerard S. Smith, as No. 1 and a newcomer just out of Yale, Alan Corey Jr., as back, the aggregation played spectacularly through the field of six teams entered in the national open and defeated Iglehart's Great Neck team, 5 to 4, in the final.

However, in the following week, Great Neck reversed the tables by outplaying Aknusti in the final for the Monty Waterbury Memorial Cup, the most sought-after handicap prize of the year. The Great Neck team comprised George H. Mead Jr., J. Peter Grace Jr., Iglehart, and Robert E. Strawbridge Jr., riding in that order.

Since the two outstanding teams had divided the major titles of the year, a third game was arranged for the new Polo Writers Cup, and on this occasion, Aknusti, with Charles von Stade substituting for Corey, outplayed Great Neck by a single goal.

The intercircuit tournament was staged at Cleveland, O., with representative teams from all the circuits except California. Blue Hill Farms of Philadelphia was supreme in this event and a Cleveland team from Gates Mills captured the 12-goal championship.

In the intercollegiate competition, held at Harvard's new field, Yale took top honors; and the national 20-goal championship went to another Great Neck team on which Iglehart starred.

National indoor championships were contested in New York, with Robert Eisner's Winmont Farms team capturing the open, Chicago's 124th Field Artillery the junior, Blue Hill Farms the Sherman Memorial, Princeton the college title, and Lawrence School the inter-scholastic.

**POPULATION OF THE UNITED STATES.** The returns of the Sixteenth Decennial Census of the United States (Apr. 1, 1940) are shown in the accompanying tables, covering the population of the United States, the States and geographical divisions, cities of 5000 or more population, and cities of 100,000 or more. Population trends revealed by the census were summarized by Director William Lane Austin of the Bureau of the Census in part as follows.

The rate of increase in the decade 1930-40 is less than one-half that shown in any previous decade since the first census in 1790. It is clear that if the present trends continue, the United States is faced with a stationary or even a declining population in about 30 or 40 years. The slowing down in population growth can be laid to the falling birth-rate and the virtual stoppage of immigration from abroad. During the past decade, all of the increase in population represents the natural increase—the excess of births over deaths. In fact, for the first time in the history of this nation, the number of emigrants during an intercensal period was greater

<sup>1</sup> Less than one-tenth of 1 per cent.

than the number of immigrants. During the decade from Apr. 1, 1930, to Apr. 1, 1940, the number of persons who left this country for foreign lands exceeded by 46,518 the number who entered the United States. This is in sharp contrast with immigration trends between 1920 and 1930, when 19 per cent of the population increase of 17,064,426 persons during that decade was attributable to immigration.

The District of Columbia, with an increase of 36.2 per cent, grew faster between 1930 and 1940 than any of the States. The fastest growing State was Florida, with an increase of 29.2 per cent, followed by New Mexico, with 25.6 per cent, and California, with 21.7 per cent. Six States, namely, Kansas, Nebraska, North Dakota, Oklahoma, South Dakota, and Vermont, lost population between 1930 and 1940 (see map, page 606). The first five of these States are located in the Great Plains and constitute a tier of States in the Dust Bowl extending from Canada to Texas. In no previous decade have more than three States lost population.

There were several changes in the rank of the

States according to population between 1930 and 1940. The displacement of Texas from fifth place by California was the only change, however, in the first ten. Florida and the District of Columbia both advanced four places, and Kansas dropped back five places.

Taking the States in large groups, it may be noted that all of the Northern States, that is, the first four of the geographic divisions shown on page 608, which had nearly 60 per cent of the 1930 population, show only about one-third of the increase between 1930 and 1940. The Southern States, however, comprising the next three geographic divisions as shown in the table, which had less than 31 per cent of the 1930 population, show nearly 43 per cent of the increase; and the Western States, comprising the Mountain and Pacific Divisions, which had less than 10 per cent of the 1930 population, show more than 22 per cent of the increase.

On Apr. 1, 1940, there were 37,987,989 persons living in the 92 cities which had a population of 100,000 or more on that date. These 92 cities had a population of 36,195,171 persons in 1930, showing an increase of 1,792,818 during the decade. This

POPULATION FIGURES FOR THE UNITED STATES, BY DIVISIONS AND STATES

\* Population of Texarkana city, Texas, 17,019 in 1940, 16,602 in 1930. † Classified as urban under special rule. \* Incorporated since 1930. \* The 1930 published figures for Vallejo city, California, corrected by inclusion of Mare Island Naval Reservation (1,596). \* South Jacksonville city, Florida, with a 1930 population of 5,597 was incorporated in Jacksonville city in 1932. \* The 1930 published figures for Evanston city, Illinois, corrected by exclusion of New Trier and Niles townships (218), erroneously returned as in Evanston city in 1930. \* The 1930 published figures for Devils Lake city corrected by inclusion of North Dakota School for Deaf and Dumb (68). \* The 1930 published figures for Lansdowne borough and for Upper Darby township, Pennsylvania, corrected by transfer of the population (519) of St. Vincent's Home from Lansdowne to Upper Darby. Upper Darby township classified as urban under special rule. \* Population of Bristol city, Virginia, 9,768 in 1940; 8,840 in 1930. \* Population of Texarkana city, Arkansas, 11,821 in 1940, 10,764 in 1930. \* Population of Bristol city, Tennessee, 14,004 in 1940, 12,005 in 1930. \* Population of Bluefield town, Virginia, 3,921 in 1940; 3,906 in 1930.

change represents an increase in population of 5.0 per cent between 1930 and 1940, as compared with 23.7 per cent for the same cities between 1920 and 1930. It is evident from these figures that the larger cities have been growing much less rapidly since 1930 than during the preceding decade.

The number of cities with a population of 100,000 or more (page 607) was one less in 1940 than in 1930—92 as compared with 93. Sacramento, Calif., and Charlotte, N.C., were newcomers to the list, while El Paso, Tex., Lynn, Mass., and Evansville, Ind., dropped below 100,000 between 1930 and 1940.

New York remained the largest city in the United

States by a wide margin over Chicago. Within the first ten cities, the only change in rank resulted from the passing of St. Louis by Baltimore. Miami jumped all the way from seventy-eighth to forty-eighth, whereas Elizabeth, N.J., dropped from seventy-third to eighty-first. It should be noted that changes in rank among the smaller cities in this group—say those under 200,000—are of little relative significance, since they may result from very small differences in actual population gain.

Twenty-eight of the cities lost population between 1930 and 1940, as compared with only four of the same cities between 1920 and 1930. Three cities, Fall River and Lowell, Mass., and Wilming-

ton, Del., reversed declines observed between 1920 and 1930 and showed slight increases in the last decade. Only one city, Washington, D.C., grew more rapidly between 1930 and 1940 than between 1920 and 1930.

The most rapid growth between 1930 and 1940 occurred in Miami, Fla., which increased by 55.6 per cent. San Diego, Calif. (37.4 per cent), and Washington, D.C. (36.2 per cent), were second and third, respectively. It may be noted that no city in the New England or Middle Atlantic Division shows an increase of more than 10 per cent.

See **PLANNING**; articles on States of the United States; **UNITED STATES**. For population movements, see **AGRICULTURE**; **IMMIGRATION**; **JEWS**; **REFUGEES**.

**PORTO SANTO ISLAND.** See **MADEIRA ISLAND**.

**PORTS AND HARBORS.** Few important developments in this country are on record, apart from the usual and continuing enlargement and deepening of channels, and the extension of dock sheds and other facilities. Instead of the usual comprehensive River and Harbor Bill, authorizing innumerable projects, large and small, Congress in 1940 passed a bill authorizing \$37,000,000 for projects considered important in the scheme for national defense.

Most ports date from early times and have grown up with the cities of which they are a part. But occasionally a new port is established under special conditions. An example of this is the port of Hueneme, in California, 75 miles north of Los Angeles, which was opened with ceremony on July 6. Two rock jetties protect an entrance channel 400 ft wide and leading to a basin 1200 x 1400 ft, from which open slips for vessels. One slip, 300 ft. wide, has 1000 ft. of wharf or quay with freight sheds. The purpose of this new port is to accommodate shipping which serves a large local district, and the project was financed entirely by a bond issue of the Oxnard County Port District.

In the harbor of New York, the new municipal Bayonne Terminal, completed by the city of Bayonne, N.J., consists of a quay with 9300 ft. of berthing, sufficient for 15 to 18 modern freight steamers. It is approached from the land by a long earth embankment or causeway across shallow water. A new dry-dock is planned for New York, 1200 ft. long, as in the new locks for the Panama Canal, and sufficient to accommodate the 45,000-ton battleships now being built. It is estimated to cost \$57,000,000, and may be located adjacent to the new Bayonne Terminal, which the Federal government has proposed to purchase for \$3,500,000 to serve as a naval supply depot.

A rail-and-water terminal on the James River at Richmond, Va., opened in 1940, is 90 miles from the Atlantic, but with a channel depth of 25 ft. for navigation. It has a concrete wharf 1250 ft long, two concrete warehouses, and a turning basin 1600 x 700 ft. Its cost was about \$3,526,000. Anticipating increased traffic with the possible extension of canalization of the Mississippi River above the Falls of St. Anthony, the city of Minneapolis has planned harbor works to cost some \$10,000,000, and in 1940 it authorized bonds for \$100,000 for a study of the project. But as Federal resources are now being concentrated on defense measures, it is likely that extending navigation farther up the river will be postponed indefinitely. The city now has a small terminal which handles package freight, grain, and coal. At Mobile, Ala., the growth of the shipping business has necessitated the con-

struction of an additional pier and large transit shed for the Alabama State Docks.

Harbors and ports in war-torn foreign countries have been subjected to savage destructive attacks by guns and bombs, and many large works have been damaged or virtually destroyed. On the other hand, the closing of the Mediterranean and the Suez route to the Far East for commercial shipping has diverted traffic to the old and longer route around the Cape of Good Hope. As a result there has been such a shipping boom and congestion of accommodations for vessels at Cape Town that it has been necessary to expedite large improvements to the harbor. An extensive program of improvement of enlargement had been adopted, and planned to cover a term of years, but the work has been rushed and is to be practically completed in 1941. It includes a large area of land reclaimed from the sea.

The existence of the port of Shanghai, on the Yangtse River, in China, was reported last spring as threatened by a tendency of the river to change its course, and by a possible breaking through of the Yellow River into the valley of the Yangtse. Levees were planned to hold the rivers in check, but war conditions prevented their construction. In Costa Rica, a new port at Golfito has been created by the United Fruit Co., of Boston, for its growing traffic with Central America; this company carries out its harbor developments with its own organization, under concessions.

See **ENGINEERS, U.S.**

E. E. RUSSELL TRATMAN.

**PORTUGAL.** A republic of southwestern Europe. Capital, Lisbon (Lisboa).

**Area and Population.** The area is 35,582 sq. mi. (continental, 34,386; Azores and Madeira, 1196), and the population was estimated at 7,460,000 on Jan. 1, 1939 (6,825,883 at the 1930 census). Living births in 1939, 26.5 per 1000; deaths, 15.5 per 1000. Marriages, 1938, 49,016 (6.6 per 1000); divorces, 822. The 1930 populations of the chief cities were: Lisbon (Lisboa), 594,390 (1936 estimate, 650,000); Oporto (Pôrto), 232,280; Setúbal, 46,398; Funchal (in Madeira), 31,352; Coimbra, 27,333; Braga, 26,692; Évora, 22,061.

**Colonial Empire.** The overseas possessions of Portugal occupy an area of approximately 808,363 square miles. In 1938 the population was estimated to total 9,405,000. Colonies not listed in the accompanying table will be found in separate articles under their respective titles: Namely, **ANGOLA**, **CAPE VERDE ISLANDS**, **MACAO**, **MOZAMBIQUE**.

<i>Colony (Capital)</i>	<i>Sq mi</i>	<i>Population</i>
Portuguese Guinea (Bolama)	13,830	415,220 *
Portuguese India * (Nova-Goa)	1,538	601,000 *
São Thomé and Príncipe (St Thomé)	386	59,000 *
Timor, Portuguese (Dili)	7,308	463,796 *

\* 1938 estimate \* Includes Daman, Diu, and Goa. \* 1936 census.

**National Defense.** Military service is compulsory. The troops in active service included an air force and a motorized regiment and numbered 28,975 officers and men in July, 1939; this, about the normal effective force in time of peace, could be increased by drawing on a body of trained reserves; late in 1939 the army on active duty was reported at a considerably higher figure. The navy is composed of 7 escort vessels, 5 destroyers, 1 torpedo boat, 7 gunboats, 3 submarines, and several auxiliary and noncombatant vessels. The naval per-

sonnel at the outset of 1939 numbered about 6300.

**Education and Religion.** Education is compulsory. The census of 1930 indicated that 67.8 per cent of the population were illiterate. Efforts to spread elementary instruction were thereafter intensified. In 1938 the public elementary schools numbered 7937; teachers, 10,149; pupils, 458,463. In addition, individuals hired by the government gave elementary instruction in small villages to some 50,044 pupils. Secondary schools numbered 43 and had 958 teachers and 18,532 pupils. The three universities and their totals of students were those of Lisbon, 3035; Coimbra, 1631; Oporto, 1213. The Roman Catholic faith prevails. The government maintains religious liberty for the individual but signed in 1940 a concordat with the Holy See assuring the preservation, to the Roman Catholic Church, of several specific rights.

**Production.** Portugal's chief fields of economic production are agriculture, mining, and fishing. Totals, yearly (1939 except where otherwise indicated), of leading products: Meat, 67,700 metric tons; fish, 180,400 metric tons (not to count some kinds otherwise measured), value \$7,160,000; wheat, 5,161,000 quintals; maize, 3,647,000 quintals; rye, 988,000 quintals; oats, 911,000 quintals; barley, 392,000 quintals; potatoes, 6,060,000 quintals; rice (1938), 684,000 quintals; wine, 7,831,000 hectoliters; olive oil (1938), 334,000 quintals; wool, 9000 metric tons. Mineral products, in metric tons, for 1939: Coal, 313,000; pyrites, 673,000; copper (1938), 4900; lead, 800; tin, 1400; tungsten trioxide, 2400. Gold (1938), 192 kilograms, value \$216,020. Manufactured products included, for 1939, 297,000 metric tons of cement and 175 metric tons of rayon; for 1938, 374,288 pair of shoes and 17,044 metric tons of paper. A leading industry, the making of cotton goods, employed some 25,000 persons. The canning of sardines, largely for export, ranked second among manufactures.

**Foreign Trade.** For 1939, imports of merchandise totaled 2,067,000,000 escudos; exports of merchandise, 1,339,000,000 escudos. In trade with the United States, Portugal's imports rose to \$18,146,290 for 1940, from \$10,002,786 for 1939; exports, to \$11,084,579 (1940), from \$6,453,640 (1939). The rise in the U.S. part of the Portuguese foreign trade coincided with obstacles that war put in the way of usual commerce with many other countries.

**Finance.** Totals, in escudos (worth about 4 cents in U.S. money), of the budget for 1940 follow, with 1939 figures in parenthesis: All receipts, 2,800,800,000 (2,815,200,000); extraordinary receipts, 759,000,000 (786,000,000), of which 735,000,000 (776,500,000) from loans; expenditures, 2,799,400,000 (2,813,200,000), of which extraordinary expenditure constituted 769,500,000 (793,400,000). Public debt at the end of 1938 amounted to 7,192,100,000 escudos, of which 3,182,700,000 external. Public debt, Jan. 1, 1940, about 7,511,000,000 escudos (bonded, 6,360,789,000).

**Transportation.** Portugal had about 2232 miles of railway line, including 463 miles of narrow gauge, in 1938. The merchant marine's steamships totaled 225,000 gross metric tons in 1939; motorships, 33,000. Ships entering the port of Lisbon in 1938 numbered 9457 and aggregated 30,309,910 tons. After the outbreak of the European War in 1939 the entries fell off greatly and held below normal until May, 1940. Thereafter they were reported to have made a sharp rally. The rise of Lisbon during the European War, to a place of great importance in civil aviation, led to the con-

struction in 1940 of an adequate, separate airport for overland airplanes, at Portela de Sacavem, in the outskirts of the city. A port at Cabo Ruivo serves oversea airplanes. By this port Pan American Airways operates a frequent service to the United States, opened in 1939. The British Overseas Airways Corporation started trips twice a week between London and Lisbon in 1940. Service by air is maintained with Italy; with Berlin, it was opened in October, 1940.

**Government.** Under a constitution adopted Mar. 19, 1933, Portugal is governed as a corporative State. It has as its executive head a President, elected by the vote of the people to a term of seven years. The people also elect a National Assembly, serving for four years. The popular vote extends to both sexes but is restricted, unequally as to the two, by requirements of literacy or of the payment of direct taxes. A corporative Chamber of 79 appointed members represents the interests of local "autarchies" and of certain social groups, administrative, economic, cultural, and moral. But one single political party is allowed to function. Entitled the National Union, it supports the government of the President. The President is assisted by a cabinet, not amenable to the will of the legislators. President, Gen. Antonio Oscar de Fragoso Carmona (elected, without opposition, Feb. 17, 1935). Premier, Minister of Finance, War, and Foreign Affairs, Dr. Antonio de Oliveira Salazar.

#### HISTORY

The Portuguese government had to accomplish a difficult task in 1940. Last of the European continental States of the Atlantic seaboard untied to German hegemony, it strove to maintain its ancient commercial and territorial accord with Great Britain and to retain Germany's good will. Holding colonies certain to be coveted by the Axis powers, it could not hope to escape a shearing of its golden fleece if it put itself in those powers' hands. The country's trade suffered from the scarcity of shipping to bring and take what it must buy and sell. Refugees, often distressed fugitives, from France and more distant points of origin, pressed in upon Portugal, straining its means to maintain them. The country had no such armed forces as could repel a serious attack by land or hold its colonies; it could ill afford even moderate increase of armament.

**Foreign Policy.** The salient event in Premier Salazar's treatment of foreign affairs was the conclusion, at the outset of August, of an agreement with Spain, binding the two governments to take counsel together in case a threat to the security or independence of either should arise. The agreement, signed at Lisbon, July 30, formed an annex to the existing treaty of non-aggression, concluded in 1939. It was not represented as binding either party to defend the other if attacked. Since the existing Spanish government held definitely friendly relations with Germany, Portugal's forming a closer bond with Spain carried her closer to Germany and in appearance at least, loosened the old bond with Britain. So far as the year's further developments revealed, it left Anglo-Portuguese relations as good as ever. No more than Portugal did Spain evidence much ardor for positive action on the side of Germany and Italy, nor did either betray enthusiasm for the extension of the war into the Peninsula. A dispatch in the *New York Times* of December 25 indicated that in Portugal German propaganda, agents in the guise of commercial travelers, and tools among the police were

rife, as though laying the way for possible military penetration. The fact that Portugal, while free and neutral, afforded to both the warring sides a passage on the Atlantic coast, between the outer world and the European continent, gave both the adversaries some incentive to respect the country's status.

Late in July reports from London told of German moves suggestive of a design to make use of Portuguese islands in the Atlantic—the Azores and Madeira—for harrying British tankers conveying oil from Caribbean ports. On July 25, a few days before the conclusion of the Portuguese-Spanish agreement mentioned above, the British Government announced that it had agreed with Spain and Portugal to let Spain obtain wheat in limited quantity from British Imperial sources and other goods from Portuguese colonies.

**Economic Situation.** A slump in commerce overseas, unemployment, and scarcity of many sorts of goods resulted from the economic dislocations inflicted by the war. The supply both of coal and of gasoline ran low. Locomotives were reported late in the year to be burning wood, except in the cases of important passenger trains. Fewer entries of ships not only limited the exports and imports by sea but deprived many maritime workers of their living. Exports failing, imports of many unessential goods were suspended. The absence of the usual stream of tourists hurt continental Portugal and, still more, Maderia and the Azores. To offset somewhat the difficulties of the year, there sprang up, after the fall of France, an exportation of tungsten, tin, sardines, and bacon overland to Germany. The influx of fugitives from France and other lands overcome by Germany increased the drain on necessities. Portugal admitted, from June through August, many thousands of persons, mainly at the French border, who presented the proper visas. Some, but by no means all, brought adequate supplies of cash; most of them hoped to pass on to other countries. At the end of August 8,000 such persons, by estimate, were in the country. Lack of ships kept them there, though a considerable number of others had by then left. More continued to come. Early in September the government suspended the entry of any more persons on their way to American countries, pending the departure of those already in Portugal and awaiting passage to such destinations.

**Concordat.** The Portuguese Government and the Vatican ratified, June 1, a concordat determining the relations of the government and the Roman Catholic Church. The Church, while not established in the common sense of the word, received specific recognition of its freedom to give religious instruction in the schools, to found and maintain educational institutions of its own, to retain possession of its property, and (under an additional, separate agreement) to conduct missions in the colonies subject to specified regulations. The Church consented to submit to the government the names of intended bishops before their appointment. The government undertook to recognize the special status of Catholic marriages, excluding from the resort to divorce the parties thus united.

**POST OFFICE DEPARTMENT.** Oldest and largest of Federal functions, a going concern when it was securely fixed in the Constitution, the U.S. Post Office Department is the executive agency for the administration of the laws of Congress in the form of postal service. Over 400,000 persons earn their living in the mail establishment, three-fourths in civil service and the remainder under contract. More than half of all regular government employees are engaged in the inter-communication of 45,000 post offices and the postal contact with the rest of the world, as well.

For the past six years postal earnings have been increasing because of the greater hire of postal facilities by the public. From a low point in 1934 the total gain has been \$180,215,463, or 30 per cent to the end of the last fiscal year—June 30, 1940. In the same period postal expense has risen in consequence of increased volume of mail and statutory enactments for the benefit of postal employees. Again from a low point in 1934 the total increased cost has been \$176,999,931, or 27 per cent. This is a true measure of postal progress, for while earnings in fiscal 1940 are again an all-time high in postal history, 1940 expense is but four millions greater than the all-time high of 1930. In sustaining an increase in the volume of business, costs have been controlled.

For the twelve months ended June 30, 1940, the statutory fiscal year in government, the huge transactions from innumerable sources that produce postal service, are seen from the total cash turnover for the year at \$7,860,802,407, as issued by the Comptroller General of the United States. It is more than all money in circulation at any one time and it equals almost sixty dollars from each man, woman, and child in the population, passing through post offices each year in cash. The audited financial result for fiscal 1940 is a net postal surplus of \$18,609,036.01, the sixth surplus in the past seven years. The main statistics are:

Audited expenditure . . . . .	\$807,732,865
Audited revenue . . . . .	766,948,627
Gross postal deficit . . . . .	40,784,238
Deduct: Nonpostal items. . . . .	59,393,274
Net postal surplus . . . . .	\$ 18,609,036

During 1940 there has been serious disruption of postal service with European countries on account of the lack of normal transportation facilities due to war conditions. The volume of both incoming and outgoing mail has decreased about 35 per cent and transportation costs have been increased considerably on account of circuitous dispatch necessary to reach both belligerent and neutral countries.

FRANK C. WALKER.

**POTASH.** Domestic production, with the aid of small importations from France and Spain, was able to meet domestic demand in 1940. The Carlsbad, New Mexico, area was the leading source. A third mine was opened during 1940 and shipments began in the latter part of the year. A new operation was notable for complete mechanization underground and for some novel chemical features

in its treatment plant. The present capacity of American producers is about 600,000 tons in terms of  $K_2O$ . The price of run-of-mine salts increased from 58½¢ to 60¢ a unit (a unit equals 1 per cent  $K_2O$ ) due principally to the increased cost of handling. The effect of the war was to increase the demand and production of refined salts.

The Bureau of the Census published in 1940 data from the census of mineral industries, 1939, from which the following is taken. Domestic production in 1939 was 532,000 short tons of prepared potassium salts, valued at \$10,039,000. They contained an estimated  $K_2O$  equivalent of 311,000 short tons. Employment averaged 1516 wage earners, who received \$2,666,000, or an average of about 80¢ per man-hour. Production was reported by five companies operating five mines, including two natural brine operations.

See FERTILIZERS; GENERAL LAND OFFICE; GEOLOGY; NEW MEXICO.

H. C. PARMELEE.

**POTATOES.** The 1940 potato crop was estimated by the U.S. Department of Agriculture at 397,722,000 bu. harvested from 3,052,800 acres averaging 130.3 bu. compared with 363,159,000 bu. in 1939, 3,017,700 acres, and 120.3 bu.; and the 1929-38 average of 366,949,000 bu., 3,295,700 acres, and 111.5 bu. The eighteen surplus late potato states produced 271,439,000 bu. and were led by Maine with 44,055,000 bu., Idaho 32,860,000, New York 26,838,000, and Pennsylvania 24,570,000 bu. The twelve other late potato states made 41,381,000 bu., with Ohio 11,800,000 bu. leading the group. These thirty late potato states made a total of 312,820,000 bu. The seven intermediate potato states led by Virginia with 10,412,000 bu. totaled 36,207,000 bu. and the twelve early potato states led by California with 10,260,000 bu. and North Carolina with 8,720,000 bu. totaled 48,695,000 bu. The seasonal average price per bu. (preliminary) received by farmers in late potato states was 54.0 cents; in intermediate states 59.3 cents; and in early potato states 74.3 cents or a national average of 56.4 cents and an estimated value of production of \$224,431,000 in 1940 compared to 69.3 cents and \$251,733,000 in 1939.

Potato crops (1940) reported from other leading producing countries included Germany 2,411,088,000 bu., Hungary 126,488,000, Italy 109,253,000, Lithuania 97,666,000, Sweden 82,294,000, Yugoslavia 70,179,000, Finland 55,850,000, Rumania 51,405,000, Norway 41,482,000, and Canada 70,500,000 bu.

**POTTERY.** See SCULPTURE.

**POULTRY.** The close of 1940 presented a generally favorable situation for the poultry producer. Domestic demand steadily improved during the late months, which was reflected in stronger prices for all poultry products. Farm prices for eggs, chickens, and turkeys were 31, 11, and 2 per cent higher respectively during December, 1940, than for the corresponding period of 1939. Feedstuffs were plentiful and the feed-egg price ratio was more favorable to the poultryman in December than at any time during the preceding two years.

Total egg production in 1940 reached 38,892 million, 2 per cent above that of 1939 and 7 per cent above the preceding 10 year average. However, the 321,682,000 laying hens on farms at the close of the year was 1.3 per cent lower than a year earlier. It was estimated that about 108 million salable chicks were produced by commercial hatch-

eries during 1940 or 10 per cent fewer than in 1939. However, improved broiler prices late in the year resulted in a strong demand for chicks, so that hatchings during December, 1940, were 20 per cent higher than a year earlier. Tentative estimates (subject to change) show that 2,220,000,000 lb. of chickens and 403,000,000 lb. of turkeys, on a dressed weight basis, were produced in 1940, 10 and 2 per cent respectively below 1939 levels. Chickens made up about 11 per cent and turkeys 1.7 per cent of the total meat consumed in the United States.

A record crop of about 33,138,000 turkeys was raised in 1940, but heavy losses on farms during November storms reduced the total marketed to slightly below that of 1939. The trend toward the production of earlier maturing, lighter weight turkeys has continued, with much experimental breeding work being directed to improving this type of bird.

A heavier-than-normal movement of poultry into frozen storage during December brought the total stocks at the end of the year to 208,234,000 lb. as compared with 167,634,000 lb. a year earlier. The stocks of shell eggs in cold storage on Jan. 1, 1941, totaled 618,000 cases, 16 per cent above that at the beginning of 1940. Nearly half of this total was owned by the Surplus Marketing Administration (q.v.) for relief distribution. Stocks of frozen eggs at the end of the year totaled 72,756,000 lb., which closely corresponds with the preceding 5-year average at this season. Heavy purchases of eggs were made under the Food Stamp Plan (see Federal Surplus Commodities Corporation), reaching nearly 3 million dozen during December, 1940. Total distribution of eggs under this plan during the year was 24,840,000 dozen.

Foreign trade in poultry products was of small importance during 1940. Exports, consisting mainly of shell eggs, totaled about one million dollars, while imports, mainly of dried yolks, were less than half as great. World trade in eggs was generally disrupted during the year. Egg exports from China, which have been at a low level since the beginning of the Japanese invasion, continued to be far below normal during 1940. Great Britain, which normally imports about 40 per cent of its egg supply, faced a serious shortage in this commodity as early as July, 1940. Poultry populations have been drastically reduced in many European countries, as a result of declining feed supplies, since all major producing countries are heavily dependent on feed imports.

E. C. ELTING.

**POWER PLANTS.** Following the 1939 upward swing in power plant construction, which continued into 1940, came the National Defense Program, the effects of which became apparent in the late summer and fall. This involved, not only further expansion of capacity by the electric utilities, but also much power-generating equipment to serve newly created munitions plants, the enlargement of government arsenals and navy yards, and many industrial establishments handling defense orders either directly or indirectly. The power demands created by the Defense Program were superimposed on those incident to a large commercial production and thus established a new high mark in power plant construction. Added to this was the vast naval and merchant marine ship-building program which involves large orders for marine boilers and turbines as well as auxiliary equipment.

During the year the Federal Power Commission issued a report containing statistics as of Dec. 31, 1939, covering the installed capacity in stationary plants generating power for public use, arranged as to type of prime mover and the character of ownership. These showed 40,317,924 total installed kilowatts of which 28,046,948, or 69.5 per cent, was in steam plants, 11,415,165 in water power, and 855,811 in internal combustion engines. The total fuel consumed was 42,441,000 tons of bituminous coal, 2,244,000 tons of anthracite, 1,538,000 tons of lignite, 17,423,000 bbl. of oil, and 191,131 million cu. ft. of gas. An average of 1.35 lb. of coal was consumed per kilowatt-hour output although many of the more modern stations produced a kw-hr on much less than one lb. of coal. Privately owned central stations, with 87.7 per cent of the total capacity, produced 90.4 per cent of the total output of electricity exclusive of that produced by private industrial and other isolated power plants.

Figures covering steam power added during 1940, as compiled by the Edison Electric Institute, indicate that the utilities added 1,380,000 kw of capacity during the year, making allowances for equipment retired from service. Their present construction program calls for 3,412,000 kw additional capacity to be added in 1941. The topping of older stations with high-pressure boilers and turbines continued, but the capacity thus added is becoming a smaller percentage of the total new construction because of the very considerable number of new stations being built.

There has been a steady increase in the average capacity of steam generating units and turbines although previous maximum sizes have not been exceeded. The largest boiler ordered during the year was for a rated steam output of a million lb. per hour at 1775 lb. pressure, 955 deg. F total steam temperature, and the largest turbine-generator was for 100,000 kw. Nine other boilers of like capacity, but lower pressure, have been in service for some time as have also larger turbine-generators. Similarly, average steam pressures and steam temperatures are increasing and, in the light of experience gained during the last few years, together with advances in metallurgy, the upper limit of steam temperature for regular commercial operation has already reached 960 deg. F. Where such high steam temperatures are employed the permissible operating temperatures for valves and turbine materials has made necessary close control of the superheat. The net result has been a general rise in the level of station efficiencies, with a large number of plants now generating a kw-hr on well under 12,000 B.t.u. and several are not far from the record of 10,746 B.t.u. per kw-hr for steam plants operating on the condensing regenerative cycle, established by the Port Washington Station of the Wisconsin Electric Power Company. Reliability of equipment has also been increased and thus lessened the amount of reserve capacity needed.

In the utility field at least half the new steam generating capacity has been in units of 400,000 lb. per hour and over, with the steam pressures divided between medium and high pressure. In general, the turbine sizes ranged from 50,000 to 80,000 kw with a few units above or below these figures.

A notable advance in steam-generating practice is a forced-circulation boiler being built for the Somerset, Mass., Station of the Montaup Electric Company, which is scheduled for operation late in 1941. This will have a rated output of 650,000 lb. of steam per hour at 2000 lb. pressure and 960 deg. F total steam temperature. The heat-absorbing

surface is made up of circuits of small-diameter tubes containing inlet orifices to proportion the water supplied to each tube, and positive circulation is assured by circulating pumps which function independent of the regular boiler-feed pumps. Although units of this type, but of much smaller capacity and lower pressure, are in operation abroad, this is the first to be employed on a commercial scale in the United States. The boiler will be fired by pulverized coal in the conventional manner and have a continuous slag-drip furnace bottom. Because of the extremely high pressure all joints throughout the unit will be welded.

A mercury boiler embodying a new design replaced the original mercury boiler at the Kearny Station of the Public Service Electric & Gas Company in New Jersey. This new boiler has a single drum, instead of seven as in the first boiler, and the furnace is completely enclosed with tubes containing mercury. It supplies a 20,000-kw mercury turbine. The exhaust from the mercury turbine generates steam at 355 lb. pressure in a condenser-boiler and the net heat rate of this mercury-steam installation, operating on the binary cycle, on test ranged from 9168 to 10,076 B.t.u. per kw-hr.

Trends in present steam-generator design include (1) wider spacing of superheater elements and lower gas velocity past them in order to minimize slag accumulations on these surfaces; (2) a reversion to conservative furnace heat-release rates for stationary plant practice; and (3) the elimination of intermediate furnace water-wall headers by welding the tube ends so as to form continuous tubes the full height of the furnace. Research has included studies of heat absorption and circulation; investigations of factors influencing the fluid temperature of ash; further developments in steam washing to minimize the carry-over of entrained solids from the boiler water; new methods of combating the presence of soluble silica compounds in feed-water; and improvements in pulverized-coal burner design.

There has been little change in industrial power plant practice, although larger units and higher steam pressures are being more widely used and the need for speedy delivery of equipment and assured reliability has resulted in innovations giving place to well-tried designs of proven performance.

Reviewing the methods of firing boilers ordered and installed during the year, it would appear that for capacities below 30,000 lb. of steam per hour stoker firing is general; from 30,000 to 150,000 lb. capacity both stokers and pulverized coal are competitive, with the number burning pulverized coal increasing as the capacity increases; and above 150,000 lb. per hour pulverized coal is predominant. An exception is noted in the case of two high-pressure boilers, each of 185,000 lb. output, nearing completion at the Cedar Street Station in Harrisburg, Pa., each of which will be fired by a traveling-grate stoker burning small reclaimed river anthracite. These stokers are the largest single stokers of their kind yet built, each having a grate area of 586 sq. ft. Use of the spreader type stoker has increased, particularly for smaller units in industrial plants, although one installation of such stokers now under construction will serve boilers of 150,000 lb. per hour steam output. This type of stoker has also been installed in the marine field under boilers on a Great Lakes steamer.

Oil or gas in certain localities is being used for firing boilers of all sizes, but the rise in price of oil toward the end of 1939 and the uncertainty of supply because of possible naval demands was re-

sponsible for a decrease in the number of new stationary boilers so fired.

The improved economy of steam plants has continually lowered the amount of coal burned per kw-hr; hence, despite the greater load imposed by increased production and defense demands, it is anticipated that coal-mining facilities will be adequate to keep pace with demands. During October the new minimum bituminous coal prices, as prescribed under the present Bituminous Coal Act, went into effect, providing lesser differentials between the poorer and the better grades of coal. This has resulted in an increased price of certain coals.

Equipment for arresting the dust, cinders, and fly ash contained in flue gases is now being extensively employed in power plants where stack discharge presents a potential source of nuisance to the community. For very large plants the electrostatic type of arrestor predominates but the mechanical type is being used extensively in the smaller and medium size plants, and recent improvements in the efficiency of the mechanical arrestor has resulted in its application to several large installations.

The steam turbine continues to be pre-eminent in the field of power generation, for both central stations and industrial power plants of large and medium size, and use of hydrogen cooling for large generators continues to increase.

The first 3600-r.p.m. quadruple-flow steam turbine-generator, a 100,000-kw machine operating at 1200 lb. pressure and 950 deg. F steam temperature, went into service at Burlington, N.J., last fall; and the largest single-casing, single-flow turbine built in this country, a unit of 80,000 kw capacity at 1250 lb. pressure and 900 deg. F steam temperature and 1800 r.p.m., was placed in service in a new power station at Oswego, N.Y. The largest 3600 r.p.m. turbine-generator yet ordered is a 75,000-kw maximum capacity machine for the new Wilmington Station of the City of Los Angeles to supplement hydro power from Boulder Dam.

The first turbine unit having a spring-mounted stator core, to eliminate frequency vibration, went into operation in August at the Westport Station in Baltimore.

Research in the field of turbine materials was continued, and at the Schuylkill Station in Philadelphia extensive investigations into blade vibration were carried out on a full size impulse wheel of 10,000 kw capacity operating under actual plant conditions at 1250 lb. pressure and 900 deg. F total steam temperature. By means of mirrors placed in the impulse blades and in the hollow shaft, and a light beam, blade vibrations were recorded on a photographic film. From these studies it developed that blade failure is due to fatigue and amplified stress resulting from resonance set up by the shock of the dense steam impingement, superimposed on the natural period of vibration of the blade. This condition exists only at partial loads when intermittent steam admission is involved. The remedy appears to lie in proper damping.

During 1940 approximately  $3\frac{1}{2}$  million h.p. capacity in heavy oil engines was put out. This represented an increase of about 600,000 h.p. over 1939. Of this total, nearly  $1\frac{1}{2}$  million h.p. went into tractors, tanks, the construction field, irrigation pumping, and for mining operations; about 600,000 h.p. was employed in the marine field; slightly more than this in general industrial plants; 213,000 h.p. in railroads; 165,000 h.p. in trucks; 118,000 h.p. in buses; and 87,500 h.p. in municipal light

and water plants. Only about 10,000 h.p. was installed in the private utility field. It is anticipated that the defense program will call for a large number of Diesel engines for tanks during the present year.

The largest engines for stationary plant service were of 3600 h.p. and from this size down to 1000 h.p. the two-cycle type predominated, with rotative speeds of 225 to 720 r.p.m. Among the smaller engines the four-cycle type predominated and higher speeds were general.

Some Diesel locomotives of 4000 h.p. were put into service and improvements in design and construction were responsible for considerable reduction in maintenance. One of the railroads reports the fuel consumption of a light-weight ten-car Diesel-electric train as 1.8 gal. per mile.

In the marine field a number of ships commissioned during the year or under construction for the Maritime Commission are propelled by Diesel engines as were also a large number of smaller craft, including tugboats, ferryboats, and auxiliary naval vessels. In many of these smaller installations Diesel-electric propulsion was employed.

The utilization of the exhaust in waste-heat boilers is showing a marked increase.

A large proportion of the gas engines built last year were employed to drive compressors and pumps in pipe-line service and a few were installed in industrial power plants. In general, the sizes ranged from 25 to 800 h.p.

Extensive employment of the Houdry process of catalytic oil cracking in the United States, requiring large volumes of air at about 50 lb. pressure and making available combustion gases at 900 to 950 F., has been responsible for the use of the gas turbine which utilizes these combustion gases in driving the air compressor. Some excess power is available. While development of the gas turbine for power generation has been continued abroad, notably in Switzerland, and some units have been built for standby plants and for locomotive service, its thermal efficiency has not yet made it attractive for commercial application in stationary plants.

The present total installed water power in the United States, for both public and private use, amounts to over 20 million h.p. which is approximately 25 per cent of the potential hydro power available. During the present year Federal and municipal projects will add 450,000 h.p. and private companies 125,000 h.p., although  $1\frac{1}{4}$  million additional h.p. is due for completion during the next two years. While most of the new hydro construction represents Federal projects a few large units are being put into extensions of existing private plants and a few such new plants, mostly of small capacity, are under construction. An exception is two new plants on the Little Tennessee River in North Carolina upon which construction has recently been started by the Nantahala Power & Light Co. One of these will have a 60,000 h.p. turbine operating under a 999-foot head and the other will have a 30,000 h.p. turbine operating under 1215 feet head. These will be the highest heads thus far employed in the East.

The table on page 623 taken from *Power* of September, 1940, lists the governmental hydro projects, either built or under construction.

It will be noted that the present capacity of Boulder Dam, 1,212,000 h.p., makes it at present the World's largest power plant, although its capacity will be exceeded by that of Grand Coulee. A significant fact is that 75 per cent of the capaci-

ty represented by Federal projects is west of the Mississippi in an area that contains only 30 per cent of the population of the country. It is also noteworthy that the Tennessee Valley Authority has now under construction a large steam plant to supplement Muscle Shoals power for the manufacture of munitions.

The long-disputed proposal to develop about 2 million h.p. on the St Lawrence River has again come to the front and is being urged by the President as a defense measure, although it is generally agreed that this power would not be available till 1944. Half of the power would go to Canada and half to the United States, and the total cost to the United States, including transmission lines, has been estimated at 287 million dollars. Present plans call for developing part of this power at Niagara Falls, through additional diversion of water around the Falls, and part at the International Rapids, at Massena Point. See ELECTRIC LIGHT AND POWER.

ALFRED D. BLAKE.

**PRESBYTERIANS.** A religious connection adhering to a system of church government by presbyters or elders and having some 60,000,000 members throughout the world. In the United States there are ten Presbyterian bodies, the largest of which follow. See also RELIGIOUS ORGANIZATIONS

**Presbyterian Church in the United States of America.** This is the largest body of the Presbyterian communion, being represented by churches in every State of the Union and having official mission stations in Alaska, Cuba, Puerto Rico, and 16 foreign lands. In 1940 its churches in the United States and abroad were organized into 42 synods and 276 presbyteries. Statistics for the year ended Mar. 31, 1940, showed a total communicant membership in full standing of 2,021,901, with adherents numbering approximately 5,000,000. The Sun-

day school enrollment totaled 1,472,666. The number of churches was 8775 and of ministers 9573. Contributions during the year amounted to \$41,-862,860, of which \$35,211,708 was for current expenses and \$6,651,152 for benevolences. The Board of National Missions received \$2,235,228; the Board of Foreign Missions, \$2,113,981; the Board of Christian Education, \$509,935; and the Board of Pensions, \$155,151, all from living givers. The Church maintains 53 colleges, 11 theological seminaries, and 2 training schools for lay workers. It published three national official periodicals, *Monday Morning*, *Everyone*, and *Women and Missions*.

The 152d annual General Assembly was held in Rochester, New York, May 23-29, 1940. The Rev. William Lindsay Young, D.D., LL.D., president of Park College, Parkville, Missouri, was elected Moderator, and the Rev. Ray Freeman Jenney, D.D., of Syracuse, New York, was appointed Vice-Moderator. The Assembly condemned the sale of materials of war to aggressor nations as "immoral and unchristian"; protested against "any effort on the part of any government to abridge the fundamental rights of men"; described as "barbarous" the assumption that the blood of one people is superior to the blood of another; urged the U.S. government to co-operate with other nations in re-establishing refugees; announced that "it holds in full communion and fellowship all members who on conscientious grounds feel that they cannot participate in military service, as well as all members who on the same grounds feel they must do so"; called upon its ministers and members "to keep and strengthen the bonds with the worldwide Christian family in all lands"; and approved forward steps taken during the previous year toward closer relations with several other Communion, including the Presbyterian Church in the United States, the United Presbyterian Church, and the Protestant Episcopal Church.

The Church has its headquarters, including the

offices of the General Assembly and the General Council, in the Witherspoon Building, Philadelphia, Pa., in charge of the Rev. William Barrow Pugh, D.D., LL.D., Stated Clerk. The Board of Christian Education and the Board of Pensions also are housed there, while the Board of Foreign Missions and the Board of National Missions are located in the Presbyterian Building, 156 Fifth Avenue, New York City.

**Presbyterian Church in the United States (South).** This division of the Presbyterian denomination covers the territory commonly known as the Southern States. It was composed in 1940 of 17 Synods and 88 Presbyteries, with 3487 organized churches, 2471 ministers, and 532,135 members. During the year 25,520 were received on confession of faith, and 26,729 by certificate. There were 14,622 adult baptisms and 7418 infant baptisms. The ruling elders numbered 17,422, and deacons, 20,120. The total Sunday School enrollment was 437,053. Contributions for current expenses during the year amounted to \$3,261,636, pastors' salaries, \$3,104,932, building expense, \$2,008,157, and for benevolences, \$3,387,488. The total per capita gift was \$22.10, of which \$6.36 was for benevolences and \$15.74 for current expenses.

Foreign mission work is carried on in six countries: Africa, Brazil, China, Japan, Korea (Chosen), and Mexico, among 36,000,000 people. Three hundred and seventy-six American missionaries constitute the working foreign force.

The Eightieth General Assembly of the Church convened in the First Presbyterian Church, Chattanooga, Tenn., May 16, 1940, with 345 Commissioners present. Rev. Frank C. Brown, D.D., pastor of the First Presbyterian Church, Dallas, Texas, was elected Moderator. The Ministers' Annuity (Pension) Fund was put into operation on Apr. 1, 1940, and within six months about eighty ministers had retired from active service under the benefits which this Fund provides. The meeting of the 1941 General Assembly will convene in Montreat, N.C., on May 22nd. Rev. E. C. Scott, D.D., is Stated Clerk and Treasurer, with office at 1218 Liberty Bank Bldg., Dallas, Texas.

**Cumberland Presbyterian Church.** One of the Presbyterian bodies whose chief strength is in the Southern States. It was formed in 1810 when the so-called anti-revival party of the Presbyterian Church in the United States of America objected to the admission into the ministry of men who were not up to the usual literary and theological standards, and to the doctrine of fatality as taught in the third and tenth chapters of the Westminster Confession of Faith. The 1940 statistical report shows: churches, 1082 reporting; ministers, 784; total membership, 73,357, a net gain of 2133 members over the previous year, with 147 churches making no report.

A general assembly which meets annually is the supreme judiciary, the 1941 meeting to be held in Denton, Tex., June 19-21, 1941. Rev. Keith T. Postlethwaite, Birmingham, Ala., was moderator of the general assembly in 1940 and the Rev. D. W. Fooks, of Nashville, Tenn., was stated clerk, treasurer, and general secretary.

TION; UNITED STATES under *Regulation in Other Fields*. For price stabilization activities, see NATIONAL DEFENSE ADVISORY COMMISSION.

**PRINCE EDWARD ISLAND.** A Canadian province. Area, 2184 square miles; population (1939), 95,000, as compared with (1931 census) 88,038. Vital statistics (1939): 2114 living births, 1122 deaths, and 641 marriages. Chief towns (with 1931 populations): Charlottetown, the capital (12,361), Summerside (3759). Education (1938): 19,588 students enrolled in schools and colleges of all kinds.

**Production.** The gross value of agricultural production for 1939 was \$15,590,000. Field crops, which covered 479,300 acres in 1939, were valued at \$10,634,000. Chief field crops (1939): Oats 4,868,000 bu., mixed grains 1,270,000 bu., potatoes 222,000 tons, roots 121,500 tons, hay and clover 294,000 tons. Livestock (1939): 99,000 cattle (including 46,000 milch cows), 48,000 swine, 46,000 sheep, 29,000 horses, 871,000 poultry. Fur production (1938-39 season) was valued at \$1,299,300. The 1939 fish catch (15,285 tons) had a marketed value of \$950,400, including lobsters \$589,700. Forestry output in 1939, equivalent to 12,526 M cu. ft. of standing timber, was valued at \$524,511. Manufacturing (1938): 229 factories, 1041 employees, \$1,131,902 net value of products.

**Government.** Budget (1940): revenue, \$2,090,032; expenditure, \$2,297,054. The King is represented by a lieutenant governor (appointed by the governor general in council) who governs with the advice of a ministry, which is responsible to the legislature and resigns office when it fails to have the confidence of that body. There are 30 members in the legislative assembly all elected for a five-year term. At the provincial elections held on May 18, 1939, there were elected 27 Liberals and 3 Conservatives. Four senators (appointed for life) and 4 commoners represent the province in the Dominion parliament at Ottawa. Lieutenant Governor, Bradford W. LePage (appointed Oct. 2, 1939); Premier, Thane A. Campbell (Liberal). See CANADA.

**PRINTING.** See MACHINE DEVELOPMENT.

**PRINTS.** The American National Committee of Engraving, organized in 1939, was especially active in 1940. The first exhibition sponsored by this Committee went on view with the opening of the New York World's Fair in May. This consisted of fifty prints from Hawaii, and was displayed in the Gallery of Contemporary Art. In exchange, an exhibition of "Fifty Prints from the Mainland" was assembled and sent to Honolulu in the early autumn. A second sponsored exhibition consisted of 117 prints in all media by Mexican artists, which, after being shown at the World's Fair, was sent on a nation-wide circuit. Still later in the year, the Committee assembled a notable collection of "One Hundred Prints" by as many artists, representing three centuries of print-making in the United States, which was shown in the Corcoran Gallery of Art, Washington, D.C., in November, and subsequently purchased in its entirety by the J.M.B. Corporation.

Under the auspices of the National Academy, the Grand Central Galleries, and the Society of American Etchers, a collection of 330 prints and drawings by American artists was assembled and sent to Italy to be shown in the American Pavilion at the International Exposition held bien-

nially in the Public Gardens, Venice. Shipment was made on April 20; the prints reached their destination in due course and were installed; but when, the last of May, it became evident that Italy would enter the war on the side of Germany, 75 per cent of the artists represented asked for the withdrawal and return of their works. The request was made and granted, the collection being placed in storage until safe reconveyance to this country could be assured.

The American Color Print Society held its first annual exhibition in 1940 under the auspices of the Print Club of Philadelphia. Lithographs, wood blocks, aquatints, and etchings were all included. The representation was from all parts of the United States and Canada.

A new graphic process involving the use of a silk screen—hence called the silk-screen process—and a stencil with oil, tempera, or fluid dye, was further developed during the twelve months under review. Excellent work through this medium was exhibited and much credit was given to the group of WPA workers by whom its potentialities were discovered and first demonstrated.

From the income derived through the Pennell bequest the Library of Congress was enabled to make still further additions to its print collection.

A vogue for miniature prints developed. Early in the year the Chicago Society of Etchers sponsored an exclusive miniature print exhibition from which 140 sales were made. The Society of American Etchers made a miniature print section a feature of its 1940 exhibition and included it in the Society's traveling show. Some of these prints were no larger than a postage stamp.

Sixty prints were sold from the Seventh Annual Exhibition of Lithography and Wood Engraving held in the Art Institute of Chicago.

The City Art Museum of St. Louis, through the gift of Miss Bernice C. Ballard, added a notable group of prints by Durer to its permanent collection, and, by bequest of Horace M. Swope, over 700 prints, plates, and books on the graphic arts were acquired. Among the Durers was a complete set of the wood cuts illustrating the Book of Revelations. The Cincinnati Art Museum acquired the Allyn C. Poole collection of prints, including examples of all periods of printmaking in every graphic media. The donor in this instance was the Museum's curator of Prints, Herbert Greer French. The Toledo Art Museum added to its collection, by purchase, a rare print by Martin Schongauer—"St. James the Greater Overcoming the Saracens." The Art Institute of Chicago acquired through purchase "The Dance of the Magdalen" by Lucas Van Leyden.

Etchings and lithographs by the late Childe Hassam were generously allocated to several of the Art Institutions of this country by the artist's widow. Among the recipients were the Corcoran Gallery of Art and the National Museum in Washington, the Telfair Academy, Savannah, Ga., the New York Public Library, and the Carnegie Institute, Pittsburgh. A notable collection of early views of Mt. Vernon and pictures of the Washington family, chiefly engravings, collected by the late Annie Burr Jennings of New York, was given to the Mt. Vernon Association and exhibited in the little gallery there in January, 1940. A retrospective exhibition of the etched work of Frank W. Benson, N.A. was held at the King Hooper Mansion, Marblehead, Mass., in June, 1940, in honor of the 25th anniversary of the making of his first etching. John Taylor Arms, president of

the Society of American Etchers, gave a demonstration of etching by television in connection with a radio transmission, which was epoch marking.

The American College Society of Print Collectors issued to its constituent membership "Waterloo Bridge" by John W. Winkler and "Birch Patterns" by Luigi Lucioni, both etchings. The Society of American Etchers, The California Print Makers, The Chicago Society of Etchers, The Prairie Print Makers, The Southern Print Makers, The Wood Block Society, and the Friends of Contemporary Prints all issued excellent prints by contemporary printmakers to their Associate members.

Among the outstanding printmakers who died in 1940 were Charles Woodbury, Jac Young, and Earl Horter. See ART.

**PRIORITIES BOARD.** See NATIONAL DEFENSE ADVISORY COMMISSION.

**PRISONS, PAROLE, AND CRIME.** For many years the prison population of the United States has mounted continuously to higher levels. Now, however, it appears from preliminary census figures that the population of State and Federal prisons may show little or no increase during the past year, and that it may even have decreased slightly. As of Jan. 1, 1941, it is estimated that the total population of all prisons and reformatories in the United States (excluding local jails and houses of correction) is approximately 180,000, the same as for the previous year. For the first time the Bureau of the Census made an exact count of all prisoners, as of Apr. 1, 1939. These figures will soon be tabulated and available. The Federal prison population has declined from 24,642 on Jan. 10, 1940, to 23,182 on the same date in 1941. The stabilization or decrease of the State and Federal prison population is due partially to an increase in the use of probation and parole, but a more influential factor has been the improvement in employment conditions, better organized law-enforcement, and a new approach to the problem of readjusting the offender.

The importance of finding some better method of readjusting the prisoner has been brought to the attention of the public most strikingly by the American Law Institute. This influential organization of lawyers and judges focused attention upon the youthful offender by showing statistically and through case studies that a tremendous proportion of adult criminality had its inception in conviction of crime before the age of twenty-one years. Reasoning from the fact that while young people under twenty-one form only 13 per cent of the population but constitute some 40 per cent of our apprehended burglars and 50 per cent of our automobile thieves, and the further fact that nearly 60 per cent of those who have a prison record again commit a crime, they urged that a Youth Justice Authority be established in each State to assume responsibility for all youthful offenders. A model act was adopted at the annual meeting of the members of the Law Institute in June, 1940. This model act, in substance, is now being seriously considered by the legislatures of several States. If adopted, it will write into State laws for the first time the notion that reliance upon punishment as the only means of crime control is logically unsound, and instead will establish in each State an authority with sole responsibility for a preventive and corrective program for young persons under twenty-one years. The fact that lawyers have at

last come to recognize that behavior problems are too complex to be handled by traditional legal methods and conventional prisons, and that responsibility for an indefinite period over young offenders must be centralized in a qualified commission having full power to utilize all of our scientific and modern methods, is one of the most hopeful trends of modern jurisprudence. (See *Official Draft, Youth Correction Authority Act*, American Law Institute, Phila.) In similar vein, the conference of Senior Circuit Judges of United States Courts, with Mr. Chief Justice Hughes presiding, recommended the adoption of an indeterminate sentence law for Federal Courts.

**Prison Labor.** The final blow to a system of prison-labor depending for its markets on the sale of convict-made goods to the public was the enactment of a Federal law prohibiting the interstate shipment of products made in prison except for Government use. This act was passed by Congress in 1940 to become effective in 1941. Together with the Hawes-Cooper Act of 1929, which became effective in 1934, and the Ashurst-Sumners Act of 1935, all of which put restrictions on the interstate shipment of prison products, the Act of 1940 put the final touches on a campaign against the sale of prison products on the open market which has been carried on since 1804. Most States and the Federal Government now have enacted laws confining the sale of prison products to government agencies. But the net result of such laws has so far been that most of the State prisons are now vast idle houses with the men milling aimlessly about crowded prison yards. The emphasis on hard labor as a punitive and profitable method of deterring crime is shifting to other forms of activity, but no satisfactory solution to the problem of prison idleness has yet been found.

**The Federal Prison System.** During the past year the Federal Government opened six new prisons, all of which were a considerable departure in design from the traditional prison. Instead of massive interior cell blocks, high walls, and tool-proof steel, they are characterized by a variety of small housing units, carefully designed admission buildings, and adequate school, auditorium, and shop facilities. The largest of these institutions has a maximum capacity of but 1200, and most of them are limited to 600 inmates. This is in sharp contrast to the mammoth bastilles at San Quentin, Calif., and Jackson, Mich., each housing nearly 6000 inmates, and the older Federal prisons at Atlanta, Ga., and Leavenworth, Kan., with an average population of about 3000 each.

**Federal Prison Industries, Inc.** With the fiscal year 1940 Federal Prison Industries, Inc., which handles the industrial program in Federal prisons, completed five and one-half years of operation. During this period the corporation has made definite progress in carrying out the primary functions of the corporation as provided by statute. In order to reduce to a minimum the indirect burden of competition upon private industry, the corporation has not only endeavored to keep each industry as small as efficient operation would permit but has also sought to diversify the manufacture of articles within each industry and, so far as practicable, to give preference to the manufacture of those articles which the Government has difficulty in obtaining from private industry or in the manufacture of which private industry is not particularly interested. During these five and a half years gratifying progress has also been made by the corporation in establishing a comprehensive vocational and

job-training program. To this the corporation devotes its most earnest thought, for it conceives its function to be not so much the making of goods as the remaking of men.

Since the organization of the corporation the number of prisoners engaged in the industries operated by it has increased from slightly over 2000 to approximately 3500, an increase of 75 per cent. It has always been the policy of the corporation, under the authority of the statute, to pay modest wages to inmates engaged in the industries, usually upon a piece-work basis, the rate being fixed after taking into consideration the expense to the Government of subsistence, clothing, and housing of the prisoners. In the five years ending with the fiscal year 1940 the corporation paid out in inmate wages approximately a million and a quarter dollars. The hours of labor are those observed by similar industries on the outside. The equipment used in most cases is the same found in similar private industries, except that no purely labor-saving equipment is used. It has been the policy of the Board to reproduce as nearly as possible the conditions of work, hours of labor, and other factors which the inmate may expect to meet on the outside after his discharge.

**War and Prisons.** The war has brought several problems affecting Federal prisons to the fore. It has raised anew the question of permitting certain classes of ex-prisoners to serve in the military forces after careful investigation of each individual case. And it has begun to provide a new class of inmates peculiar to war times—the inilitant objector to the registration law, the unreconstructed alien, and the draft evader.

**Parole.** The campaign against all systems of parole seems to have abated somewhat during the past year, save in the State of Illinois. This has been due in part to the more cautious attitude of parole boards and a realization that no satisfactory substitute to the fundamental concept of the parole system can be evolved. Several States have made real progress in taking the parole system entirely out of politics as a result of the National Parole Conference held in Washington, D.C. in 1939.

All but two States (Mississippi and Virginia) have provisions for parole, but in less than ten States is there any really adequate provision for supervision on parole. This explains the criticism frequently leveled at parole and parolees who continue their anti-social actions. Except in those States having an adequate system of supervision, it would be more accurate to describe the release procedure employed as that of conditional release instead of parole.

**Crime Trends.** The latest official crime statistics of the Department of Justice showing the number of offenses known to the police in 336 cities with populations over 25,000 for the first nine months of 1939 and 1940 indicate a slight decrease for murder, robbery, and rape, and increases for manslaughter by negligence, aggravated assault, burglary, larceny, and auto-theft (see table, p. 627).

Long-time trends for these same offenses covering sixty-nine cities having populations of over 100,000 for the period 1931-40 inclusive, but for only the first three months of each year, are sharply downward for murder, manslaughter by negligence, aggravated assault, robbery, and auto theft. During these ten years burglary decreased only slightly, and there were marked increases for rape and larceny.

**Significant Studies in Penology.** A number of significant studies in penology were completed

OFFENSES KNOWN TO THE POLICE IN 336 CITIES WITH  
POPULATION OVER 25,000  
January to September, inclusive, 1939 and 1940 \*

and published during 1940. *Prison Administration—An Educational Process*, is the third of a series of studies in prison education published by members of the Division of Education of the Department of Correction of New York State. The others in this series include *Social and Economic Studies in Correctional Institutions* and *The Training of Prison Guards in New York State*, published in 1939, and 1938 respectively (Columbia Univ. Press, New York). *The Prison Community*, by Donald Clemmons (Christopher Publishing House, Boston), presents a sociological study of a typical prison in a midwest State. *A Report on the Development of Penological Treatment at Norfolk Prison Colony in Massachusetts*, by Commons, Yahkub, and Powers (Stanford Univ Press), describes some of the experiments in new methods of prison administration carried on at that institution from 1927 to 1934. Two outstanding investigations of interest include that of prison administration in California and of paroles and pardons in Massachusetts.

The most complete study of the prison system made in recent years was published by the U.S. Department of Justice as Volume V of the "Attorney General's Survey of Release Procedures." It presents the outstanding facts about the major prisons and reformatories for men in America. Supplementing this study is the survey by The Osborne Association of New York City of State juvenile institutions, which covers twelve States.

**PROTESTANT EPISCOPAL CHURCH**.

In response to a summons to face urgent present-day problems from the Presiding Bishop, the Rt. Rev. H. St. George Tucker, the General Convention of the Episcopal Church meeting in October, 1940, at Kansas City, Mo., endorsed a ten-year advance program, called Forward in Service. This new movement is described in *The Plan of Action* as "a ten-year program to set every unit in the Church at work upon the tasks God has assigned to it." The first year of the movement is devoted to preparation, re-dedication, and re-enlistment, reaching its first objective early in May, 1941, when a Church-wide roll call will enable all baptized members of the Church to register their loyalty and willingness to go forward in service in the days ahead. Forward in Service is directed by a commission of prominent Churchmen and women, under the leadership of Bishop Tucker. This commission replaces the former Forward Movement Commission first appointed by the General Convention of 1934.

The plight of the Church in the world today was brought again to the attention of General Convention by the Rt. Rev. Noel Baring Hudson, secretary of the English Society for the Propagation of the Gospel. By invitation of the Presiding Bishop and as official representative of the Archbishop of Canterbury, Bishop Hudson described the extraordinary wartime needs of the overseas work of the English Church. The Convention authorized an appeal to the American Church for \$300,000 to aid British missions. Of this amount \$50,000 was immediately voted by the Woman's Auxiliary from the United Thank Offering of 1940. This offering, presented triennially by the women of the Church, is used for the training and support of women missionaries, advance work in the mission field, and other purposes. In 1940 the offering totalled nearly \$975,000.

The Convention advanced the cause of Christian co-operation and unity by continuing the Commission on Approaches to Unity which for several years past has been discussing a concordat with the Presbyterian Church; by approving membership in the Federal Council of Churches of Christ in America and in the World Council of Churches. Two months later (December, 1940) representatives of the Episcopal Church were welcomed to the biennial meeting of the Federal Council.

Other actions of the General Convention included: The adoption, after more than 20 years of consideration, of an official Church flag; the designation of Washington, D C, as the seat for the Presiding Bishop; adoption of a new Hymnal, the first revision in twenty-four years; plans for the retirement of bishops at 72 years; and the election of the Rev. Lloyd R. Craighill, for a quarter century a missionary in China, as Bishop of Anking to succeed the Rt. Rev. D. T. Huntington, resigned. Other resignations accepted by Convention were: the Rt. Rev. Benjamin Brewster as Bishop of Maine; the Rt. Rev. Edward L. Parsons, as Bishop of California; the Rt. Rev. G. F. Mosher as Missionary Bishop of the Philippine Islands.

The Convention took appropriate recognition of three leaders in the national life of the Church who retired at the close of 1940: John Wilson Wood, as executive secretary of the National Council's Department of Foreign Missions after

41 years service with the Council and its predecessor the Board of Missions; Grace Lindley, as executive secretary of the Woman's Auxiliary to the national Council after more than thirty years at headquarters; and the Rev. Robert W. Patton, "father of the Nation-wide Campaign," as director of the American Church Institute for Negroes.

Despite ruthless wars in Europe and Asia, the Church's missionary work went on. The undeclared war in the Orient between China and Japan entered its third year. More and more the Gospel was being heard in hitherto untouched areas: in Western China where many were finding haven from the havoc of war and among refugee groups everywhere. The vitality of the Chinese Church was unmistakable and all signs pointed to a "bright sky tomorrow."

In Japan the new religious law brought profound changes, the full import of which is still uncertain. In accord with Government regulation, however, all American and English bishops of the Nippon Sei Ko Kwai—the Japanese branch of the Episcopal Church—resigned and the whole government of that Church passed to Japanese bishops of which there are five. This change in leadership may necessitate some re-alignment of the 13 dioceses in Japan and perhaps the naming of additional Japanese bishops. The Japanese law also provides that all foreign support of evangelistic work cease on Dec. 31, 1940, and of educational work by Apr. 1, 1941. No time limit was placed on foreign aid to medical and social work. Hence American co-operation in St. Luke's International Medical Center, Tokyo, will continue for the present at least.

In 1940 the total number of communicants of the Episcopal Church in 7995 parishes and missions was 1,489,384, an increase of 22,786 over the preceding year. The clergy numbered 6335; 149 priests were ordained. In the 5000 Church (Sunday) schools, 492,554 pupils were enrolled. Their special missionary offerings for the three years 1938-40 as reported to General Convention amounted to \$919,801.82. Baptisms during the year numbered 69,473 and confirmations 74,318. The government of the Church centers in a General Convention which meets triennially. The next session, the fifty-fourth, will be held in Cleveland, Ohio, in October, 1943. Between sessions of the General Convention the affairs of the Church are conducted by the National Council.

The headquarters of the National Council, which is the Board of Directors of the Domestic and Foreign Missionary Society, is in the Church Missions House, 281 Fourth Avenue, New York.

**PRUSSIA.** See GERMANY under *Area and Population*.

**PSYCHIATRY.** While strictly a medical science, by definition the treatment of mental illness, the field of psychiatry has greatly expanded within recent years. This expansion has paralleled a changing conception of health and ill-health generally and their factors, health being determined not solely by soundness of the body but also by social, domestic, economic, and occupational status and the emotional features of the individual's adaptation to his environment. Thus mutually useful and closer contacts have been made with the disciplines of anthropology and sociology (cultural backgrounds, community and family studies, living conditions) and education (mental hygiene in the schools; re-education, an integral part of treatment programs). At the same time psychiatry becomes more characteristically a biological science

(genetics) and looks hopefully to biochemistry for light upon abnormal psychic processes. (For survey of the literature of biochemistry in relation to mental disease, see McFarland and Goldstein: "Biochemistry of Manic-depressive Psychosis," *Amer. J. of Psychiatry*, July, 1939; "Biochemistry of the Psychoneuroses," *ibid.* March, 1937; "Biochemistry of Dementia Praecox," *ibid.* November, 1938; "Biochemistry of Epilepsy," *ibid.* January, 1940.)

With the swing away from the compartment idea in medicine long favored by ultra-specialization, intimate liaisons with other clinical branches have developed (psychosomatic medicine; child psychiatry). "In modern therapy, we dare not think of either 'soma' (body) alone nor of 'psyche' (mind) alone; . . . we have to deal with a highly complicated, integrated body-mind unit, . . . disturbances on any level of the integration—anatomical, physiological, neurological, or psychobiological—will exert effects upon the whole unit." (Barker, *Psychotherapy*, 1940.)

The significance of psychiatry and neurology in the broad domain of medicine, and the urgency of research in this field, are reflected in the fact that more than one-third of the total appropriations of the Rockefeller Foundation (q.v.) to the medical sciences in 1939 was devoted to these subjects. "The main interest of this division (the medical sciences) since 1931 has lain in the development of research and teaching in psychiatry and neurology and subjects contributory to their advancement." (Gregg, *Annual Report of the Rockefeller Foundation*, 1939.)

Attention continues to be focused upon the various shock methods of treatment of the psychoses. Ross reported to the American Psychiatric Association a two-year follow up of 1039 insulin-treated cases of schizophrenia from the New York State hospital service. These were compared with a control group treated by the usual methods but without insulin. On the conclusion of treatment, cases classified as recovered or improved were three times as numerous in the insulin group as among the controls. At the end of two years however the recovery-improved ratio had fallen from 65.3 per cent of the treated cases to 45.4 per cent.

Bond (Institute of the Pennsylvania Hospital) observed in a control group, followed two years, that although only 4 per cent were listed as recovered or much improved on termination of treatment, 16 per cent were so classified at the two-year follow-up. It is thus apparent that a goodly number of patients diagnosed as schizophrenics, who are not well on leaving hospital, recover or greatly improve at varying intervals thereafter, while many in the recovered-improved group on discharge do not maintain their mental health.

The advantage of insulin is that recoveries are prompt, whereas spontaneous recoveries may take one to three years. Ross also found that the recovery rate for patients whose illness did not exceed six months was ten times that of cases of five or more years' duration. Treatment with insulin combined with metrazol sometimes succeeds where insulin alone fails; and metrazol used alone has proved useful in other psychoses, particularly certain types of depression.

Pharmacologic shock therapy continues to be widely used in most parts of the world; and while the high hopes originally entertained have been considerably dampened, its results to date are notably better than those of previous treatment methods, and indeed in some cases appear spectac-

ular. With present-day technique, risks have been reduced to an almost negligible minimum. The procedure has given rise to a tremendous amount of valuable research, and has moreover considerably facilitated the understanding of psychotic processes.

Latterly electric shock therapy, introduced by Professor Cerletti of the University of Rome, has been used to replace pharmacological methods. Kalinowsky, formerly associated with Cerletti and now at the New York State Psychiatric Institute and Hospital, reports jointly with Barrera (*Psychiatric Quarterly*, October, 1940) on the use of the electric shock technique at that center. A precisely measured current is passed for one-tenth of a second between the frontotemporal regions. Unconsciousness is instantaneous and followed by a seizure of grand mal or petit mal type. The patient promptly regains consciousness without memory of the procedure. Advantages claimed over other methods of shock therapy are that the technique is more exact and easily controlled, that it can be given to larger numbers of patients at less cost in time and money, and that patients experience no unpleasant fore- or after-effects. Therapeutic results are said to compare favorably with those of other shock procedures. A comprehensive discussion of "Prognosis in Schizophrenia," with survey of the literature, is presented by Blair (*Jl. of Mental Science*, May, 1940).

Electroencephalography, recording electric oscillations from various brain areas, has gained in importance as a diagnostic measure, particularly in localizing gross pathology (trauma, tumor). Lennox, Gibbs, and Gibbs, on the basis of electroencephalographic tracings from relatives of epileptics, conclude that "the dysrhythmia of epilepsy is inheritable"; and since cases of latency or predisposition revealed by the tracings far outnumber cases with overt disease, they estimate that "persons with a predisposition to epilepsy form about 12 per cent of the population" (*Archives of Neurology and Psychiatry*, December, 1940). This procedure has been of value in identifying applicants for training as airplane pilots who may be predisposed to epilepsy.

There have been numerous reports of successful, sometimes startling results of treatment of psychotic states associated with vitamin deficiency. By the intravenous administration of vitamin B<sub>1</sub>, deficient mainly because of inadequate food intake, the course of an acute alcoholic psychosis (delirium tremens) may be greatly shortened. Likewise in subclinical pellagra with mental changes in the foreground (hebetude, stupor), diagnosis may be established and remarkable cure effected by the administration of nicotinic acid.

A great social problem in which psychiatry is vitally interested is that of alcoholism, a prominent factor in mental disease. In comparison with other countries, notably Sweden, Switzerland, and Holland, this issue has been conspicuously neglected in the United States. To make now a concerted attack upon it there has been organized the Research Council on Problems of Alcohol, an associated society of the American Association for the Advancement of Science; and there has been established as official organ of the Council the *Quarterly Journal of Studies on Alcohol*, now the only scientific periodical in English dealing solely with this subject. (*The British Journal of Inebriety* has been discontinued.)

The Council's first Symposium on Alcoholism took place at the annual meeting of the A.A.A.S.

in Philadelphia, Dec. 27-29, 1940. (To be reported in the *Amer. Jl. of Psychiatry*.) Overholser estimated "that there are in the United States probably more than 100,000 persons suffering from alcoholism at the present time." Kolb (U.S. Public Health Service) defined the situation: "Alcoholism is a serious health problem that has been handled largely by police authorities, with the result that the alcoholic has been treated as a criminal rather than as a sick individual. Present-day methods of handling chronic alcoholics are ineffective or harmful. An intensive study of the prevalence, causes and effects of alcoholism is necessary to establish a sound basis for better methods of prevention and cure."

Another comparatively neglected field, both in general medicine and psychiatry, is that of the process of aging and the disabilities connected therewith. This unmindfulness is in marked contrast to the research activities in diseases of children and the intensive studies in schizophrenia, the psychosis of adolescence, now going forward. To rectify the situation the National Institute of Health of the U.S. Public Health Service (q.v.) has organized a Unit on Gerontology, with a National Advisory Committee of scientists in contributory disciplines, to conduct co-ordinated research both in the problems of aging (gerontology), and the diseases of the involutional period and their treatment (geriatrics). "With the conspicuous shift to greater age in the population, senescent individuals are becoming increasingly significant in the national economy and defense" (Stieglitz, in Charge Investigations in Gerontology). In the new program psychiatry will have large interest in view of the frequency and seriousness of the psychoses of the later decades of life.

Extramural care of the mentally ill is receiving increasing attention, not only because it is sound policy but also because of ever increasing demand for new hospital construction to relieve overcrowding which is never relieved. From California, Rosanoff, Director of Institutions, reports that as of Dec. 31, 1940, 17.26 per cent of the aggregate patient population of the seven State hospitals was maintained in extramural care. This is a record figure and has made possible a reduction in overcrowding (population in excess of capacity) from 24.73 per cent two years ago to 17.16 per cent as of Jan. 1, 1941.

Especially noteworthy is the expansion of activity in the field of psychiatry and neurology in the several States of South America, notably Brazil, Peru, Argentina, Uruguay, as represented by the increasing number of scientific journals published on that continent. During the past five years some 10 new publications have appeared, and there are currently approximately as many South American periodicals devoted to neurology, psychiatry and allied subjects as in North America.

During 1940 a number of psychiatrists of international fame passed from the scene. Among these must be mentioned especially Edward Mapother, head of Maudsley Hospital, teaching center for the British Empire; H. Douglas Singer, president of the American Neurological Association and president-elect of the American Psychiatric Association; Julius Wagner-Jauregg, originator of the malaria treatment of dementia paralytica. See PSYCHOLOGY under *Mental Hygiene*.

CLARENCE B. FARRAR.

**PSYCHOLOGY.** The focus of experimental interest has shifted away from simple condition-

ing (habit training) to the problem of how pathological phenomena are caused. Persistence of unsuccessful behavior, analogous to that of neurotic and psychotic patients and of incorrigible psychopaths, has been produced in rats under certain conditions of frustration by N. R. F. Maier, N. M. Glaser, and J. B. Klee. J. McV. Hunt of Brown has produced abnormal hoarding in adult white rats by feeding frustration in early infancy. *Conditioning and Learning*, by E. R. Hilgard and D. G. Marquis, a critical survey of the literature of conditioning with bibliography of more than 900 titles, discusses the implications of the facts of conditioning for other problems of learning, voluntary action, emotion, and personality. Recognition of the practical value of psychophysiology has led to the creation of posts for psychophysicists in the Federal Civil Service.

Experimental investigation of all the traditional problems continues in increasing volume. The hearing tests at the New York and San Francisco World's Fairs present the widest survey of hearing ever made. Results show no significant sectional differences, but do show a decrease in hearing acuity with age, according to H. C. Montgomery. Among the many significant experimental monographs are *Studies in the Psychology of the Deaf* (from the Clarke School at Northampton, Mass.); *Studies in Quantitative Psychology* from the University of Illinois; edited by H. Woodrow; and *Reminiscence and Gestalt Theory* by J. R. Martin. Several psychological investigations have grown directly out of the war, among the most interesting being those on British children evacuated from large cities. Evacuation has increased mild nervous disorders, but not serious ones, according to C. Burt. A. Straker and R. H. Thouless find that young children adjust themselves to evacuation better than older, and that the presence of the child's own brothers and sisters in the foster home helps.

Of theoretical interest are *Mathematico-deductive Theory of Rote Learning: A Study in Scientific Methodology* by C. L. Hull, C. I. Hovland, R. T. Ross, M. Hall, D. T. Perkins, and F. B. Fitch, *Comparative Psychology of Mental Development* by H. Werner, translated by E. B. Garside, and *The Innumerable Instincts of Man* by C. A. Claremont (London). *Dynamics in Psychology*, by W. Köhler, proposes a theory of field action within the nervous system and attempts to corroborate it with new facts in perception and memory. Progress has been made on the *Cumulative Psychological Index* being prepared by New York City WPA workers under the direction of A. T. Poffenberger. *Psychological Index Abstract References*, edited by H. L. Ansbacher, covers the years 1919-28. Reflecting the internationalism of scientific technology is the *Dictionary of Terms and Expressions of Industrial Psychology*, in German, English, French, and Hungarian, by M. Erdélyi and F. Grossman (New York). *Hunger for Wholeness*, by T. H. Howells, approaches the psychology of personality from the viewpoint that present social chaos results from the frustration of man's universal quest for unity within the self and between the self and society. *How Character Develops*, by F. Kunkel and R. E. Dickerson, is the first organized summary in English of the basic conceptions of Kunkel's "We-Psychology." *Current Psychologies, A Critical Synthesis*, by A. J. Levine, does much to unify the conflicting theories of contemporary psychology and to relate them to everyday life. *Fields of Psychology*, edited by J. P. Guilford, is

a symposium. *General Psychology*, by R. W. Hubbard, treats the everyday problems of real people from a genetic point of view; the emphasis is social rather than biological. Among other introductory texts are *Psychology* by L. F. Shaffer, B. V. H. Gilmer, and M. Schoen, and *The Psychology of Normal People* by J. Tiffin, F. B. Knight, and C. C. Josey. Among the many books dealing with special fields are *The Psychology of Music*, by M. Schoen, and *The Mechanism of the Human Voice*, by R. Curry, with a bibliography of 400 titles. *How to Overcome Stammering*, by M. F. Gifford, develops the thesis that people stammer because they have not learned to solve their emotional problems and conflicts.

In the field of counseling are *Occupational Counseling Techniques: Their Development and Application* by W. H. Stead and others; *Introduction to High School Counseling* by E. G. Williamson and M. E. Hahn, and *Avocational Interest Patterns: A Study in the Psychology of Avocations*, by D. E. Super. There are also numerous popular books on marriage, love, hate, worry, personality improvement, and other pressing problems of everyday life, among them *Your Marriage: A Guide to Happiness* by N. E. Himes, and *The Art of Understanding* by H. J. Baker. *Twelve Against Alcohol*, by H. L. Nossen, gives case histories of twelve dipsomania patients who in their own words tell of their growing addiction to alcohol and their struggles in its grip.

**Tests and Measurements.** Evidence of the variability of the I. Q. under special conditions continues to pile up. S. Stinchfield-Hawk reports increases as great as 60 points, following corrective speech training. The interpretation of I. Q. changes is at present a subject of lively controversy. Some psychologists, notably the Iowa group, believe that increases and decreases of I. Q. reflect real variations in intelligence, resulting from environmental factors. As might be expected, when experimental results strike so deeply at the heart of a theory that has become almost an article of faith, the Iowa studies have been subjected to severe criticism from the standpoint of methodology, and numerous other experimenters have partially repeated some of the Iowa experiments without substantiating the conclusions. Though ten nursery schools report increases in I. Q. during nursery-school attendance, corresponding increases have been found in control groups not at school. Confirmed hereditarians regard I. Q. shifts as artifacts resulting from flaws in test technique. Some suggest that the first or the second I. Q. (whichever happens to be lower) may be unrepresentative because of emotional disturbance, ill health, or restricted powers of expression (as in the case of a child with a speech impediment). Others point out that verbal tests are unfair to the hard-of-hearing and to persons with language handicaps. Among the new scales proposed to meet this difficulty are *The Chicago Non-verbal Examination* and *The Leiter International Performance Scale*. Some point out that tests at different age levels measure different human abilities to different degrees, and that a varying I. Q. might have been anticipated from this fact alone. A growing body of psychologists are abandoning the concept of "intelligence" as a unitary trait, and are seeking, chiefly by means of factorial analysis, to identify the various human abilities operating to different degrees in different tests. Thurstone finds a limited number of "primary mental abilities." Thompson, on the other hand, regards mental abilities as prac-

tically infinite in number, a hypothesis which, if true, would preclude the possibility of measurement. M. W. Richardson contends that the present age-scales for testing intelligence violate the generally accepted logic of measurement. He considers both mental age and I. Q. to be unfortunate concepts that inevitably create false psychological issues. K. Lewin suggests that the "momentary" mental age of a pre-school child may depend on the motivational situation. Temporary increases in intelligence-test scores of adults have been obtained following dosages with certain drugs, and variously interpreted as due to release from anxiety or to mere increase in talkativeness or in motor activity. In recent years, it has been customary in many places to base a diagnosis of feeble-mindedness largely on the results of intelligence tests. With increasing evidence of the variability of I. Q.'s, there is now a tendency to return to the earlier practice of basing such a diagnosis more on social criteria, despite the fact that social criteria are at present vague and subjective. E. A. Doll of Vineland proposes to give objectivity to social criteria through the Vineland Social Maturity Scale. *An Annotated Bibliography of Tests and Scales*, by C. K. A. Wang (Peiping, China), includes 1776 items.

**Educational Psychology and Child Psychology.** That memorizing is not the prototype of learning, but that the understanding of organized wholes is, constitutes the most significant contribution of G. Katona's *Organizing and Memorizing: Studies in the Psychology of Learning and Teaching. Psychology in Education*, by H. Sorenson, stresses the importance of understanding the pupil's emotional reaction during the learning process. O. H. Mowrer calls attention to the fact that expectancy (whether of reward or of punishment) is always a state of tension and as such unpleasant. Anxiety is commonly employed to motivate classroom learning. Mowrer suggests that "in order for class-room learning to proceed efficiently, the arousal of anxiety must be followed as promptly as possible by its dissipation, after a 'correct' reaction is made." Effects of frustration upon both human and animal subjects have been widely studied. G. L. Freeman found that even college men, after failing in difficult visual discriminations, tended to respond wrongly earlier in the new series.

A. Gesell points out that both parents and teachers ought to recognize the individuality of children, defer to and understand the limitations of immaturity and laws of growth, and by consistent and sympathetic care give the child that feeling of security in which his personality may develop wholesomely. M. I. Preston calls attention to the deplorable effect on a child's security in school and home produced by failure in reading. F. O. Schwarz has found that 71 per cent of poor readers studied by him were definitely eye cases which improved following correction of the defects. *How to Increase Reading Ability*, by A. J. Harris, is a basic text for teachers. Among other new books are *Helping Children to Read*, by G. Hildreth and J. L. Wright, and *Teaching Reading to Slow-Learning Children*, by S. A. Kirk.

War hysteria has reawakened the demand for military training in the schools. E. C. Johnson contends that there is no valid argument for school military training. Military drill is not only worthless but harmful to growing boys, and investigation indicates that it does not aid in the development of obedience, character, or even patriotism. School military training includes nothing that is

relevant to preparation for modern warfare. R. Lippitt reports an experimental study of the effects of democratic and authoritarian atmospheres in children's clubs. He found conflict and hostility in the authoritarian group; none in the democratic group. The latter produced more creative work.

Among new books are *The First Five Years of Life, The Pre-school Years*, by A. Gesell, H. M. Halverson, H. Thompson, F. L. Ilg, B. M. Castner, L. B. Ames, and C. S. Amatruda; *Studies in the Development of Young Children*, by N. Bayley; *Child Psychology for Professional Workers*, by F. M. Teagarden; *From Infancy to Adolescence*, by F. K. Merry and R. V. Merry; *Your Child's Development and Guidance Told in Pictures*, by L. H. Meek; *Consider the Children—How They Grow*, by E. M. Manwell and S. L. Faks; *The Emotionalized Attitudes: The Contribution of Research to Teachers Concerned with Learning, Conduct, and Character*, by T. H. Briggs and others, and *How We Learn*, by B. H. Bode. *The Psychology of Exceptional Children*, by K. C. Garrison, discusses gifted children, the retarded, and the physically handicapped. *The Education of Exceptional Children*, by A. O. Heck, deals with the organization, administration, and supervision of education for children who are blind, crippled, deaf, socially maladjusted, mentally defective, etc., and also for the gifted. From a study of 167 gifted boys, L. M. Terman and M. Oden found that above the I. Q. level of 140, adult success is largely determined by such factors as social adjustment, emotional stability, and drive to accomplish. P. Witty finds that the present school organization fails to provide adequately for gifted children. Nonconformity with discipline requirements increased steadily from examination to examination in the gifted children he studied. He thinks we should seek to identify gifted children by consistently remarkable performance in any valuable area, but that we should not segregate them in homogeneous groups. This practice he considers a serious menace to democratic faith. As the late L. S. Hollingworth has shown, children of superior intelligence are apt to exhibit negativism, and the play of those with I. Q.'s above 170 is typically solitary. G. K. Sturup points out that bright children often exhibit unrest and distraction in school and indulge in flights of fantasy to such an extent that their work falls below that of the class in general. This should not be mistaken for evidence of a psychopathic constitution. He thinks these children should be given a more challenging and at the same time a more liberal form of instruction. H. W. Zorbaugh maintains that the community should identify its gifted children, preferably at their entrance to school, and the children should be encouraged by feeling that their unique abilities are appreciated.

**Mental Hygiene and Psychopathology.** I. S. Wile contends that the term *abnormal* should be relegated to lay usage, and that orthopsychiatry should prefer informative terms, such as *usual* and *unusual*, *desirable* and *undesirable*, *legal* and *illegal*. This would do away with many foolish attempts to reduce to mediocrity individuals who deviate in socially desirable directions. E. D. Hutchinson has clarified the relationship between genius and insanity by pointing out that creative endeavor involves such difficulties that frustration is almost inevitable for a time, even though success may come at last. Insanity is often the result of the frustration of creative effort. *Psychiatric Clinics for Children*, by H. L. Wittner, surveys psychiatric

services for children over the past quarter century. T. R. Sarbin calls attention to the ineffectiveness resulting from confusion of three current uses of the term adjustment: (1) conformity, (2) mastery, and (3) compromise. The first seeks to minimize individual differences, the second to capitalize on them, and the third to transcend the conflict. H. A. Cotton, Jr., in discussing the scope and purposes of the State mental-hygiene clinic, points out that it is as important to educate teachers, physicians, nurses, courts, etc., as it is to make examinations of patients.

*Men Against Madness*, by L. S. Selling, surveys the history of the fight against insanity from ancient times. *New Facts on Mental Disorders, Study of 89,100 Cases*, by N. A. Dayton, is a statistical study of patients admitted to Massachusetts hospitals for mental disease, during the period from 1917-33. *Social and Biological Aspects of Mental Disease*, by B. Malzberg, presents a statistical analysis, based on the records of admissions to New York State hospitals. H. M. Pollock and B. Malzberg point out that neither schizophrenia nor manic-depressive psychoses appear in frequencies that are in accord with the requirements of simple Mendelian inheritance. These authors contend that hereditary and environmental factors should not be regarded as antithetic, but as joint causes. L. M. Weinberger and F. C. Grant find evidence that hallucinations can arise from peripheral lesions.

Of major importance, both theoretical and practical, is I. Kendig's and W. V. Richmond's research publication *Psychological Studies in Dementia Praecox*. The authors conclude that "we must abandon or greatly modify our concept of deterioration" in schizophrenia. Of the 2000 cases which they studied, few had actually deteriorated in intellect. There was functional impairment, not permanent loss. Kraepelin originally grouped together hebephrenic, catatonic, and paranoid forms under the term "dementia praecox," because he believed all showed intellectual deterioration. E. F. Lowry believes that the pathology of schizophrenia is organic. H. S. Sullivan believes that "there are two unrelated syndromes confused under the rubric of dementia praecox,"—one an "organic, degenerative disease," and the other "a disorder of living, not of the organic substrate."

R. Ralston has found educational therapy valuable in increasing the personal happiness of the patient and "filling out actual deficiencies in academic education which may have been a hindrance to him." There is an increasing effort to reach and help maladjusted individuals before a definite psychosis develops. S. Coffman and D. W. Orr report an experimental mental hygiene class for maladjusted children between the ages of 7 and 15. Coffman and Orr feel that free expression of opinion and group discussion of the mechanisms of behavior and feeling give the child a sense of oneness with others. According to A. Krider, occupational therapy for maladjusted children is restricted by the fact that the child's range of manual skills is small and his ability to envision a project as a whole and to sustain interest for a long period are small in comparison to adult standards. The therapist must discipline himself to let each child work out his individual problems, even to the detriment of the task in hand.

*Psychological and Neurological Definitions and the Unconscious*, by S. Kahn, is written from a psychoanalytic viewpoint. *The Journal of Abnormal and Social Psychology* carried an interesting symposium on psychoanalysis by psychologists of

other schools who had been psychoanalyzed. J. F. Brown points out that the term psychoanalysis is used interchangeably in three senses (1) a method of psychological observation, (2) a systematized set of theoretical constructs, and (3) a method of psychotherapy. An independent psychologist may utilize the method of observation without necessarily accepting the theoretical constructs.

Psychiatry once meant a rather narrow medical specialty, limited to the treatment of nervous and mental diseases. Some contemporary psychiatrists, however, have so effectively broadened their outlook that their field is almost co-extensive with social psychology. There is growing recognition of the fact that the individual can not be understood apart from his social matrix and it is evident that no social order is safe while paranoid individuals can rise to posts of power. Psychopathologists are responding to this challenge.

**Social Psychology.** In *Beyond the Clinical Frontiers*, E. A. Strecker points out that crowds, prejudiced pressure groups, mobs, and nations at war exhibit irrational beliefs and behavior that duplicate the symptoms of most mental diseases. He stresses the perils of propaganda. *Social Psychology*, by C. Bird, includes enlightening discussions of propaganda and the psychological aspects of war and an extensive treatment of attitude measurement. Of interest in this connection is *The Pulse of Democracy: The Public-Opinion Poll and How it Works*, by G. Gallup and S. F. Rae. *Social Psychology*, by O. Klineberg, emphasizes the cultural and environmental aspects of the subject. *The Plans of Men*, by L. W. Doob, attempts to integrate some aspects of the social sciences with some of the practical problems of everyday life. L. D. Zeleny has attempted to develop mathematical formulas for measuring social status, which he defines as the degree of acceptance of a person by his associates in a particular group.

*Criminal Behavior*, by W. C. Reckless, is a textbook of criminology written from the comparative point of view. It stresses the fact that what constitutes crime varies according to the values of the society observed. Reckless contends that heredity plays no discernible role in crime causation, but the failure to obtain adequate satisfaction of wishes, accompanied by severe emotional stress, is an important force in motivating crime. *Girls on City Streets*, by J. A. Goldberg and R. W. Goldberg, reports studies of 1400 case histories. *Juvenile Delinquents Grown Up*, by S. Glueck and E. Glueck, follows through an additional ten-year period the same offenders previously studied by the authors. The various peno-correctional methods to which the young delinquents were subjected are discussed in relation to subsequent success or failure, recidivism, serious crimes, etc., and eight prediction tables are included. *Trends in Crime Treatment*, edited by M. Bell, is published by the National Probation Assn. *Marriage and the Child*, by J. H. S. Bossard, deals with the child welfare movement in the United States, the changing status of the child, and the factors influencing marriage rates and stability. *Industrial Conflict: A Psychological Interpretation*, edited by G. W. Hartmann, is the 1939 Yearbook of the Society for the Psychological Study of Social Issues. Its 1940 yearbook deals with the psychology of war. See ANTHROPOLOGY; PSYCHIATRY.

MABEL F. MARTIN.

**PUBLIC ASSISTANCE.** See SOCIAL SECURITY BOARD; also, RELIEF.

**PUBLIC BUILDINGS ADMINISTRATION.** The Public Buildings Administration is the unit of the Federal Works Agency responsible for the design, construction, and maintenance of most of the buildings in use by the administrative and service departments of the Federal Government.

These activities were originally assigned to the Office of the Supervising Architect, now more than a century old, and formerly within the Treasury Department. The Reorganization Act of 1939, which created the Public Buildings Administration, brought together the Public Buildings Branch of the Treasury's Procurement Division (containing the Office of the Supervising Architect) and the Branch of Buildings Management, including the office of space control, National Parks Service, Department of Interior. Thus within the framework of a single agency, designers, construction engineers, and building superintendents work in close co-operation so that the experience of each may contribute to the plans for Federal buildings.

In Washington, the PBA continues the construction and management of buildings to house the various administrative departments and agencies of the Government, co-operating with the National Capital Park and Planning Commission and the Commission of Fine Arts so that the development of the capital city may follow an orderly and efficient plan.

Throughout the rest of the country the services which the Federal Government extends to its citizens cover a wide range of building types. The Treasury Department must have custom houses; the Coast Guard needs air stations, the Department of Justice, court houses and penitentiaries; the Labor Department must have immigration depots, the Public Health Service, hospitals and quarantine stations; and the Department of State, ambassadors' residences and embassies in foreign countries. The Post Office Department needs the greatest number of Federal buildings. With respect to post offices, a federally owned building becomes legally eligible when the postal receipts exceed \$10,000 per annum.

In addition to the design and construction of new buildings, the PBA also remodels and extends existing buildings, carries out necessary repairs, and acquires new building sites as well as disposing of those no longer needed. For each of the new buildings constructed, its Section of Fine Arts plans appropriate mural or sculptural decorations, the commissions for which are awarded to artists selected through anonymous competitions. See ART; PAINTING.

Within the District of Columbia, its Office of the Buildings Manager repairs, cleans, and protects government owned and leased buildings, and the Office of Planning and Space Control co-operates with other government agencies in planning space needs and assigns space in Federal buildings and leases space in private buildings.

The work of the Public Buildings Administration falls into two major categories, work within the District of Columbia and work throughout the rest of the country.

Expansion of government as the result of the National Defense Program intensified the work of the Office of Planning and Space Control in the District of Columbia during the last year. Government-owned buildings in Washington represent a net area of almost 16,000,000 square feet, but during the last six months it has been necessary to lease over four million more square feet to accom-

modate the large influx of workers on the National Defense Program.

During the 1940 fiscal year, PBA spent approximately \$10,000,000 on Federal buildings in the District of Columbia for new construction, extensions, remodeling, and major alterations. The largest project undertaken was the construction of the Social Security and Railroad Retirement Board buildings, costing \$14,750,000. These buildings add 1,580,000 square feet to administrative office space for the Capital City. Because of pressing defense needs, these buildings have been temporarily loaned to the National Defense Advisory Commission and co-operating divisions of the War Department.

Another large project begun during the year was the first unit of a War Department Building. Congress appropriated \$10,800,000 for the site and the construction of the smaller of two units.

Three general Federal office buildings—to be assigned temporarily to agencies with emergency space problems—were worked on during the year. The first, now in use by the Census Bureau, was completed, and the other two are in plan stage.

Outside the District of Columbia, a total of 335 buildings were completed during the year by the PBA and contracts were awarded for 303 additional projects. Exclusive of land costs, this work represents an expenditure of \$42,775,000.

Well over two hundred of these projects were small post office buildings, with allotments generally ranging from \$70,000 to \$100,000 for site purchase, construction costs, and the PBA administrative expenses.

Being one of the major construction agencies of the Government, the PBA is taking an active part in the national defense program. Beginning in November, the Federal Works Administrator has assigned to the Commissioner of Public Buildings more than 70 projects for family housing units to be erected near army posts or factories turning out defense orders. By December 31, twenty-six construction contracts had been awarded and work was well underway on a dozen projects. The PBA housing projects range in size from 20 family units needed for Fort Dupont, Del., to a 3000 unit development at San Diego, Calif., called the largest low-cost housing project ever to be undertaken in this country. See ARCHITECTURE.

W. E. REYNOLDS.

**PUBLIC DEBT, Bureau of.** See FISCAL SERVICE.

**PUBLIC FINANCE.** The national defense program brought sweeping changes in the finances of the Federal Government. During the year, plans for expanding the Army and Navy were completed calling for appropriations, authorizations, and recommendations aggregating \$28,480,000,000. This program, embracing the fiscal years 1940, 1941, and 1942, was divided as follows:

ARMY AND NAVY APPROPRIATIONS, AUTHORIZATIONS, AND RECOMMENDATIONS  
(Fiscal Years 1940, 1941, and 1942)

		[In Millions of dollars]
Army . . . . .	..	\$13,704
Navy . . . . .	..	11,587
Expansion of industrial plant. . . . .	..	1,902
Other defense activities . . . . .	..	1,287
Total . . . . .	..	28,480

Confronted with such huge armament expenditures, public interest in a balancing of the Federal

budget dwindled. Even in the presidential campaign in the fall of the year, this issue did not play the important role that had been expected. With both parties committed to a defense program adequate to arm the United States for war with major European and Asiatic powers, economies could be effected only in other portions of the budget. For the fiscal year 1942, however, almost two thirds of all expenditures in the budget were to be for national defense, so that the possibilities of major reductions in total expenditures were greatly limited.

The Roosevelt Administration adopted a policy of increasing taxes so as to secure in this way all the funds needed for the regular budget, apart from national defense, and sufficient funds to cover the maintenance of the Army and Navy, as distinct from their expansion. To achieve this object, two revenue acts were passed in 1940, increasing income taxes and imposing an excess profits tax. A further rise in taxation was planned for 1941, and the Treasury launched studies with this end in view. The sharp upturn in business activity and national income, at the same time, swelled tax collections further.

The Treasury was concerned not only with raising money to finance the defense program, but also with the problem of preventing an inflation of commodity prices because of the huge purchases by the Government and the consequent bottlenecks created in a number of markets and industries. The sale of Government bonds as far as possible to individual investors, rather than banks, was planned to avoid a further increase in bank deposits and to absorb income that would otherwise go for consumption, expanding the demand for goods produced by industries whose capacity was needed for defense production. Also, some curtailment of ordinary public works was effected to free productive capacity for armaments and to build up a backlog of such projects that could be launched during the postwar readjustment period, when a severe depression was feared. The Treasury, however, opposed the adoption of the drastic program for checking further increases in bank deposits and raising interest rates which the Federal Reserve System proposed to help prevent commodity price inflation.

**Federal Revenues.** The receipts of the Federal Government from taxation for the fiscal year ended June 30, 1940, were \$5,387,000,000, an increase of \$223,000,000 as compared with the preceding fiscal year. The small size of this increase in receipts reflected the fact that higher tax rates were not yet in effect and the upturn in business

activity following the outbreak of the war was not fully reflected in the income tax receipts for the fiscal year. Income taxes produced \$2,125,000,000 in 1940, or \$57,000,000 less than in the year before. The lower corporate and individual earnings of 1938 made for lower income tax collections in the first half of the 1940 fiscal year. Other sources of revenue were mostly moderately higher. The extent to which the new tax laws and increased national income would expand Federal receipts was reflected in the budget estimate that \$7,012,000,000 would be collected by the Federal Government in the 1941 fiscal year.

The chief sources of Treasury revenues in the year ended June 30, 1940, with estimates for 1941 and 1942, are shown below.

**Federal Expenditures.** Federal expenditures during the 1940 fiscal year totalled \$8,998,000,000, of which national defense amounted to \$1,579,000,000. In the preceding fiscal year, expenditures totalled \$8,707,000,000, of which \$1,163,000,000 went to national defense.

The President's budget message for 1942, issued immediately after the turn of the year, emphasized the extent to which national defense would produce revolutionary changes on the expenditures side of the Federal accounts. The estimated expenditures for the fiscal year 1941 were \$13,202,000,000, of which fully \$6,463,000,000 would go for national defense. In the 1942 fiscal year, total expenditures were scheduled to rise to \$17,485,000,000, and national defense outlays to \$10,811,000,000. These budget estimates, furthermore, did not include the cost of the aid-to-Britain program, which, it was indicated semi-officially, might about equal for a time that of the domestic armament program. Despite the rapid increase in national debt, interest payments of the Federal Government were expected to increase but slowly because of the low interest rates prevailing. The interest on the public debt, which amounted to \$1,040,000,000 in the 1940 fiscal year, was expected to rise to \$1,100,000,000 in 1941, and to \$1,225,000,000 in 1942.

Estimated expenditures for the fiscal year beginning July 1, 1940, with estimates for the two following fiscal years, are shown on pages 635-636.

**Treasury Financing Policy.** The Treasury financed the deficit for the fiscal year ended 1940, amounting to \$3,740,000,000, in part through new loans and, to the extent of \$1,083,000,000, through reducing its working balances, which had been very large at the beginning of the fiscal year. The increase in the public debt for the fiscal year 1940 amounted to \$2,527,000,000. Only a small part of

\* Excess of credits, deduct.

the money obtained through the sale of securities came from new public issues of Treasury obligations, however. Sales of Treasury obligations to the social security funds produced \$606,000,000, while United States savings bonds sales yielded \$1,102,000,000. As the debt limit of \$45,000,000,000 was closely approached, Congress authorized an increase in the limit of \$4,000,000,000, consisting of special national defense obligations with maturities up to five years. In December, the Treasury issued \$531,000,000 of 5-year  $\frac{3}{4}$  per cent obligations under this series. The only public issue for cash during the fiscal year was \$521,000,000 of 2 per cent bonds maturing in 1953, which was offered on Dec. 8, 1939. For the calendar year 1940 the only public issue for cash, made from the defense notes, was \$631,000,000 of  $2\frac{1}{4}$  per cent bonds maturing in 1956, which was sold on July 22.

The status of the public debt for the fiscal year ended June 30, 1939, with estimates for the two following years, contained in the President's budget message of Jan. 3, 1941, was as follows:

## GROWTH IN THE PUBLIC DEBT IN FISCAL YEARS ENDING JUNE 30, (000 OMITTED)

	Estimated, fiscal year 1942	Estimated, fiscal year 1941	Actual, fiscal year 1940
Public debt at beginning of year . . . . .	\$49,156,972	\$42,967,531	\$40,439,532
Increase in public debt during year:			
To meet deficiency in revenues and receipts, general and special accounts . .	9,310,093	6,289,441	3,740,249
Less debt retirements included in deficit . . .	100,000	100,000	129,184
Decrease in working balance on general and special account . . . . .	9,210,093	6,189,441	3,611,065
Net increase in public debt during year . . . . .	2,210,093	2,189,441	2,527,999
Public debt at end of year . . . . .	58,367,065	49,156,972	42,967,531

**The Public Debt.** The gross public debt at the end of the calendar year 1940 amounted to \$45,-

024,631,488, the highest total ever attained. In addition, there were outstanding \$5,901,000,000 of obligations of governmental agencies guaranteed by the United States.

The vast increase in the scale of borrowings that would be required by the Treasury to finance the defense program made necessary important changes in financing methods. The Treasury made an intensive study of this problem during the latter months of the year. The policy of selling new bonds to a much greater extent to individual and corporate investors, rather than to the banks which had been the chief outlet in recent years, would necessitate a sharp increase in the average interest cost of new money, and also drastic changes in the form of the obligation sold. Savings bonds were not regarded as suitable for this purpose, not only because of the 29 per cent interest cost involved, but because holders were entitled to cash them at any time. It was felt that a coupon obligation, even if not purchasable by banks, would meet a better reception than savings bonds that were offered on a discount basis. The intention of the Treasury to make future issues of Federal bonds fully taxable made its task all the greater. This proposal, announced shortly after the election in November, brought sharp increases in quotations of already outstanding Treasury obligations, for this plan would give a scarcity value to outstanding issues having the tax-exempt privilege.

The public debt at the end of the calendar year 1940 is shown below.

See BUDGET, BUREAU OF THE; CUSTOMS, BUREAU OF; FINANCIAL REVIEW under *New Financing*; FISCAL SERVICE; INTERNATIONAL BANKING AND FINANCE; MONEY, U.S. STOCK OF; REPARATIONS AND WAR DEBTS, TAXATION. See foreign countries under *Finance*. For appropriations see UNITED STATES under *Legislation*.

General fund balance. . . . .	74,216,460 05	1,118,109,534.76	306,803,319.55	2,476,160,943.36	1,928,454,975.75

wider responsibilities in matters of health and social welfare. This stimulation is largely the result of the adverse economic conditions, which have brought into public consciousness the lack of adequate health facilities for large groups of population. Not only have economic conditions focussed attention on these needs, but they have also increased them.

During 1940, the Federal Government, through the U.S. Public Health Service, continued its assistance to States, by means of grants-in-aid, in expanding and improving State and local health services.

For the fiscal year 1940, the funds appropriated for this purpose were increased from \$8,000,000 to \$11,000,000, and the latter amount was appropriated for the fiscal year 1941. Under the program for improving the qualifications of public health personnel, 1142 persons received training during the year. The additional funds made available to the States during 1940 were utilized principally in strengthening or establishing special programs, such as those for pneumonia, tuberculosis, cancer, and malaria control, and for dental hygiene and industrial hygiene activities.

The end of the fiscal year 1940 marked the second year of intensified activities in combating the venereal diseases under the Venereal Disease Control Act of 1938. Federal funds totaling \$8,080,000, made available to the States in the fiscal years 1939 and 1940 under this act, supplemented by approximately \$10,300,000 from State and local sources, have enabled State and local health authorities to put into effective operation administrative procedures for the control of the venereal diseases. Among these important measures are improved practices in case-finding and case-holding, expanded and improved diagnostic and treatment facilities, and the provision of free drugs for the treatment of indigent or part-pay patients. There are indications that the number of new cases of syphilis reported annually has about reached the peak. For the fiscal year 1941, Congress appropriated \$6,200,000 for venereal disease control activities, most of which will be allotted to the States.

Among the advances made in research were: The preparation of rickettsial vaccines by a method employing the yolk sac of the chick embryo, and especially the development of a vaccine for epidemic typhus fever; the successful transmission of the virus of poliomyelitis to the Eastern cotton rat and to the white mouse, thus making these animals available for experimental purposes; and the demonstration of the encouraging possibility of developing effective immunization against pneumonia.

Cancer control and research were concerned particularly with fundamental biological problems, the carcinogenic properties of chemicals, clinical and therapeutic studies conducted at the tumor clinic of the Marine Hospital in Baltimore, Maryland, where 226 patients were treated by various methods during the first eight months of operation, grants-in-aid for research projects, and the loan of radium to hospitals for use in the study and treatment of cancer. During the year, seven additional States instituted special cancer control programs, making a total of 17 States now conducting such programs.

In the hospital care and medical treatment of American seamen and other legal beneficiaries—the oldest function of the Public Health Service, dating from its origin in 1798—provided in 26

marine hospitals, 126 relief stations and over 130 contract hospitals, approximately 70,000 patients were furnished more than 2,000,000 days of hospital relief, while 353,724 patients were given approximately a million and a half office treatments.

In addition to these hospitals, the Public Health Service conducts two special institutions for the confinement and treatment of drug addicts, principally Federal prisoners. One of these institutions, located at Lexington, Kentucky, operated during the fiscal year 1940 with an average daily population of 1014; the other, at Fort Worth, Texas, had an average daily population of 410, but will eventually have a bed capacity of 1000. The purpose of these hospitals is to treat and rehabilitate drug addicts where possible, and to utilize the opportunity afforded to study the various problems of drug addiction.

The Public Health Service continued to provide diagnostic psychiatric services to 10 Federal courts during the year. Freedmen's and St. Elizabeths Hospitals, in Washington, D.C., were transferred to the administrative supervision of the Public Health Service during 1940.

The Public Health Service administers the Federal quarantine laws and regulations in preventing the introduction of dangerous communicable diseases into the country from abroad and the interstate spread of disease. Although quarantinable diseases were prevalent in many parts of the world during 1940, the only instances in which such diseases reached United States territory during the year were two cases of smallpox, which were stopped at quarantine—one at Honolulu and the other at New Orleans. Successful measures were also taken to prevent the introduction, by aircraft, of yellow fever from South America, where it is present practically throughout the entire continent north of 30° south latitude.

During the year, quarantine officers of the Public Health Service inspected 15,607 vessels, carrying 1,422,517 passengers and seamen, and fumigated 900 vessels. Medical officers of the Service examined 637,398 alien passengers and 551,489 alien seamen at various ports of entry. Of these, 8793 passengers and 1271 seamen were certified to immigration officials as having mental or physical defects or disease. Inspections were also made at United States airports of entry of 2184 airplanes, carrying 35,667 passengers, of whom 11,171 were aliens.

A total of 64,442 applicants for immigration visas was examined by medical officers of the Public Health Service stationed at American consulates in foreign countries, and of these, 576 were found to have a disease or condition which made their exclusion mandatory, while 15,046 were found to have conditions likely to affect their ability to earn a living. In view of conditions incident to the war which increase the danger of the importation of disease into the United States, Federal quarantine procedures will be intensified while such conditions obtain.

According to morbidity and preliminary mortality reports received and compiled by the Public Health Service, health conditions in the United States were generally favorable during 1939 and the first six months of 1940. In 1939 most of the important communicable diseases were below the 5-year (1934-38) median as well as below the figures for 1938. An outbreak of poliomyelitis occurred in the South Atlantic States early in the summer of 1939, and the incidence of the disease became slightly above normal in other localities

later. The pneumonia death rate again declined sharply in 1939. The marked decrease in deaths from this disease during the past two years reflects the more intensive use of improved diagnostic and treatment methods and, perhaps, also the tendency to earlier diagnosis and treatment. An epidemic of influenza of mild type, appeared on the West Coast in the latter part of November, 1940, and was spreading eastward at the close of the year. Few deaths were reported from the disease.

The crude death rate for 1939 was the lowest on record, namely, 10.6 per 100,000 population as compared with 10.7 in 1938. On the basis of preliminary figures, a slight increase in the death rate is indicated for 1940 as compared with the preceding year, probably resulting principally from increased mortality in the chronic diseases of late adult life. These are the diseases, especially cancer and heart diseases, to which the Public Health Service is now devoting greater attention.

Detailed accounts of the activities of the Public Health Service may be found in the Annual Reports of the Surgeon General.

**The National Institute of Health.** The National Institute of Health, the principal research institution of the U.S. Public Health Service, is the successor to the Hygienic Laboratory, established in 1887. In 1930, Congress expanded the scope of research activities and changed the name of the Hygienic Laboratory to the National Institute of Health. Since 1938 the Institute has gradually been moved from Washington, D.C., to new buildings at Bethesda, Maryland, which were dedicated by the President on Oct. 3, 1940.

Under broad Congressional authorization, the National Institute of Health conducts investigations into all fields of health, in both pure and applied science, and in public health administration. The divisions, indicating the broad scope of investigations, include chemistry, industrial hygiene, infectious diseases, nutrition, pathology, pharmacology, zoology, epidemiology, cancer (the National Cancer Institute, established by act of Congress in 1937, is part of the National Institute of Health), and public health methods. In 1940, a unit of gerontology was organized to study the problems of aging, especially the biology of senescence and mental and physical diseases of old age. Through the Institute, the Public Health Service administers the act regulating the sale, in interstate commerce, of viruses, serums, toxins, and analogous products used in prophylaxis and therapeutics.

THOMAS PARRAN.

**PUBLIC UTILITIES.** See BUSINESS REVIEW; ELECTRIC LIGHT AND POWER, etc

**PUBLIC WORKS ADMINISTRATION (PWA).** The Public Works Administration, formerly the Federal Emergency Administration of Public Works, was consolidated into the Federal Works Agency July 1, 1939. It was created under authority granted the President under Title II of the National Industrial Recovery Act, approved June 16, 1933, to bring about an expansion of Federal and non-Federal public construction that would increase employment, stimulate private industry, and promote economic recovery. The agency was originally established for two years and funds for its operation were made available from the \$3,300,000,000 appropriated for the accomplishment of the purposes of the Recovery Act as a whole. From early 1937 to the summer of 1938, PWA was in a state of liquidation. Congress on

June 16, 1938, enacted the Public Works Administration Appropriation Act of 1938, which authorized a new program of public works and provided an appropriation of \$965,000,000 for projects which, in the determination of the Administrator, could be commenced prior to Jan. 1, 1939, and could be substantially completed by June 30, 1940. The life of the organization was extended to June 30, 1941.

There have been five Public Works programs and, as of Nov. 1, 1940, the total of the allotments under all PWA programs was \$4,108,225,779 for 34,465 projects with a total estimated cost of \$6,000,728,349. PWA programs embrace three major classes of projects; (1) projects for Agencies of the Federal Government, classed as Federal projects; (2) projects undertaken by State and local governments or other public bodies, classed as non-Federal projects; and (3) railroad projects. (Loans, but no grants, were approved for privately-owned railroads.) Under the non-Federal program allotments were made for 16,641 projects (including 32 railroad projects) estimated to cost \$4,222,250,278 and under the Federal program allotments were made for 17,824 projects costing \$1,778,478,071. The share of the applicant in the non-Federal program is approximately \$1,900,000,000.

Both the PWA Federal and non-Federal programs were substantially complete as of July 1, 1940, with the exception of a few large projects which are rapidly nearing completion.

**PUBLISHING.** See COPYRIGHT; LITERATURE, ENGLISH AND AMERICAN; NEWSPAPERS AND MAGAZINES.

**PUERTO RICO.** A West Indian Island, forming a territory of the United States. Acquired from Spain through the Treaty of Paris, 1898. Small adjacent islands, Vieques and Culebra, are included in its jurisdiction and statistics. Capital, San Juan.

**Area and Population.** Area, 3435 square miles. Population, 1940 (U.S. Census), 1,869,255; 1935 (by special census of the Puerto Rico Reconstruction Administration), 1,723,534; 1930 (U.S. Census), 1,543,913. In 1940 the dwellers in places of 2500 or more numbered 566,357; the rural population, 1,302,898. The territory had, in 1940, 544.2 inhabitants to the square mile—an exceptional density for an area dependent mainly on agriculture. Births totaled 73,044 in 1939 and came to slightly less than 4 per cent of the population. Deaths in 1939 totaled 32,631 and constituted 17.8 per 1000, the lowest yearly rate recorded. The births exceeded deaths (1940) by more than 40,000, and comparable though not quite so great excesses had been the rule. Despite an apparent excess of emigration over arrivals from elsewhere, the population gained by 21 per cent in the ten-year period 1930-40. Colored inhabitants (1938) were stated as 417,401; whites, 1,388,079. Populations of cities (1940): San Juan, 169,247; Ponce, 65,182; Mayagüez, 50,376.

**Education.** Not far from 4 persons in 9 of the population being in their fifteenth year of age or younger, the need for schooling was more prevalent than in the general run of the States and Territories. Enrollments of pupils in the public day schools in the year ending June 30, 1940, numbered 286,098, or about 15 per cent of the population; of the pupils, 68 per cent were in the lowest four grades; less than 6 per cent were in grades 9-12.

Public schools were numerous, 1773 in all; four out of five were rural elementary schools; teachers numbered 6294. The year's expenditures for these schools averaged \$25.57 to the pupil in regular attendance; they totaled \$5,470,517 as budgeted.

The University of Puerto Rico, at Rio Piedras and Mayaguez, giving instruction in various branches of higher education, had 4987 on its roll in 1940. Its faculty and administrative staff numbered 277. A School of Tropical Medicine, attended largely by students from elsewhere, not only gave instruction and conducted research in its field but operated a hospital newly reconstructed to meet contemporary standards.

**Production.** The territory, as an economic producer, is predominantly agricultural; its main manufactures are those processing its agricultural products. Of some 2,000,000 acres of land area, about 825,000 acres were reported in 1940 as under cultivation. Of the remainder, 780,000 acres were pasture, mainly clear, but some of it wooded; 120,000 acres in farm woodland; and only some 280,000 acres were not in farms. Sugar cane, the most extensive cultivated crop, occupied approximately 300,000 acres, divers minor crops, grouped, 250,000; coffee, 225,000; tobacco, 33,000. In the year ended with June 30, 1940, 8,795,932 tons of sugar cane were gathered and ground, they produced 1,018,803 tons of sugar (value, about \$66,000,000). Tobacco, on 33,262 acres, produced 18,369,848 lb.; in value, \$2,572,000. The crop of coffee totaled 23,498,000 lb., worth \$4,247,500 at the price fixed for the domestic market. Crops grown mainly for the farmers' subsistence included sweet potatoes, corn, rice, cowpeas, beans, and bananas. Cotton of the sea-island type was grown on a rising scale: in 1940, on 4000 acres. Manufactories, apart from the sugar mills, produced rum, alcohol, embroideries, men's clothing, canned fruits and juice, cigars, cigarettes, and straw hats.

**External Trade.** In the year ended with June 30, 1940, Puerto Rico imported merchandise to the value of \$107,030,482 and exported to the total of \$92,347,242. Of imports, \$100,517,184 came from the United States; and to that destination went \$90,002,156 of the exports. Thus other countries sent Puerto Rico only \$6,513,298 of its imports and took only \$1,445,086 of its exports for that year. The year's exports of sugar were 868,568 tons, value \$57,328,790.

For the calendar year 1940 Puerto Rico's imports of merchandise from the United States amounted to \$103,972,709, as against \$86,447,423 for 1939, and exports to the United States declined to \$83,773,274 for 1940, from \$88,977,210 for 1939. Sugar accounted for five-eighths of the exports to the United States; namely, to \$51,800,616 for 1940 and \$58,325,509 for 1939. Other articles exported to the United States: tobacco and its manufactures, \$8,700,595 for 1940 and \$5,006,782 for 1939; rum, \$6,366,261 and \$4,413,129; women's cotton apparel, \$5,248,072 and \$7,671,831; worked linen, \$2,662,387 and \$4,037,672. Relative to conditions in the trades in cotton and linen needlework, see under *History*, below. The main groups of imports from the United States were vegetable foods, \$19,670,656 for 1940 and \$16,394,573 for 1939; textile products (1940), \$15,750,420 and (1939) \$17,418,279; machinery and vehicles, \$12,678,098 and \$8,292,527; other metal goods, \$8,856,557 and \$5,561,450.

**Finance.** The general fund of the Territorial Government received, in the fiscal year ended with June 30, 1940, insular revenues of \$16,867,933. It expended \$15,393,982. Insular internal taxes made

up about three-fourths of the revenue. Of the expenditure, \$5,678,403 was for education; \$2,068,895 for public health. Bonded debt amounted to \$27,200,000 on June 30, 1940.

**Transportation.** Highways in Puerto Rico were said to have an aggregate length of 11,252 miles in 1939. Surfaced roads maintained by the Territory totaled 1033 miles. Railroads, aggregating 922 miles, included 574 miles for the special uses of producers of sugar. Pan American Airways maintained frequent service between San Juan and Miami, Florida. Airplanes also covered routes to a number of South American and West Indian points.

**Government.** Under the Organic Act, as passed by the U.S. Congress in 1917 and later amended, Puerto Rico has the status of an organized Territory of the United States. Its citizens are U.S. citizens. A Governor, the chief executive officer, holds office by appointment of the President of the United States, confirmed by the U.S. Senate. The popular vote elects a Legislature of two houses and a Resident Commissioner to the United States.

Governor at the beginning of 1940, Admiral William D. Leahy, U.S.N. retired. Resident Commissioner, Bolívar Pagan.

## HISTORY

**General Conditions.** The Territory experienced economic improvement in 1940. External trade, essentially with the United States, increased, as did public revenues and banking business. Political partisanship was relatively free of the violence that had marked it in former years of hardship and discontent.

**Governor Leahy's Administration.** Governor Leahy was withdrawn from his post in November to become Ambassador to France. His service of some 14 months had not lasted long enough to permit of his carrying through any series of policies of long range. Instead of appointing an immediate successor, President Roosevelt entrusted the duties of the office temporarily to the Commissioner of Education, Dr. José M. Gallardo, Acting Governor through the rest of 1940.

The Legislature held a regular annual session, convening on February 12. It transferred to the Federal Government, for use in the latter's defenses, the small islands of Desecheo and Monito, in the Mona Passage, and some tracts on the Bay of San Juan; granted land to the San Juan Housing Authority; appropriated \$50,000 to help laborers grow crops for their subsistence; strengthened control over the growth and marketing of coffee; created an Advisory Pardon and Parole Board; permitted the use of alternate jurors in some sorts of cases at law; enacted a measure against adulterated and improperly branded foods and drugs; and remodeled the law as to traffic on the highways, after an American pattern. The Governor vetoed a bill to create a Territorial Water-Resources Authority, a Federal agency of like purpose being in contemplation at the time.

**Elections and Parties.** A quadrennial election (November 5) voted to Bolívar Pagan another term as Resident Commissioner in Washington. The Coalition party (Republican-Socialist) retained its control in the Legislature's House of Representatives but lost its previous majority in the Senate, a new party, the Popular Democratic, obtaining a Senatorial majority of one. The older minor parties did not in any case make conspicuous gains. For the first time in many years the demand for Puerto Rico's independence was not a dominant

issue. Vote (approximate): Coalition, 215,130; Popular Democratic 206,405; other, 127,467.

In the field of partisanship the rise of the new Popular Democratic party won chief attention. Its progenitor, Senator Luis Munoz Marin, former Liberal party man, had charged the Federal Director of Territories and Insular Possessions, five years before, with not trying to extend the New Deal adequately to the Territory; later he had crusaded successfully for enforcing the law against great landholdings (q.v. below). The party's first convention, held in July, adopted principles summarized by the slogan, "bread, land, and liberty." It favored independence, but tempered this leaning with a readiness to accept Statehood in the Union. It sought division of big estates among small farmers. Its goal was prosperity for the struggling part of the people, and it gained a great following among the small cultivators. Another new group, the Unification party, formed by Speaker Garcia Mendez of the House, in protest against reported corruption among the Coalition, came out poorly at the polls; it had sought, outright, for Statehood. Garcia Mendez himself was involved (September 28) in an encounter at Utuado, fatal to one man; friends maintained that a band had tried to kill him and that his bodyguard had fired to save him; hostile accounts made these two the aggressors. The Nationalist party remained in existence but did not enter the general election; on February 26 it re-elected as its president Pedro Albizu Campos, still in Federal prison for attempting to overthrow United States rule in Puerto Rico by organizing an armed rebellion.

**Defenses of the Island.** The Federal drive to put the United States in an adequate state of defense made much work in Puerto Rico. Governor Leahy proposed in October that the WPA increase its working force in the Territory to 30,000 men, from 19,162, thus raising those engaged on preparing defenses to 20,000. The Island was regarded as the base for preventing naval invasion of the Caribbean Sea and as an outpost against attack on the southeastern coast of the Union. Against 1877 acres at Punta Borinquen, obtained by condemnation for a base of military aviation, the Department of War deposited \$332,728 toward defraying the claims of the expropriated. It intended to turn the site into a highly developed airport, at considerable expense. The previously undertaken naval aeronautical station at San Juan was put in commission on May 1, just a little over a year after its authorization, among nine others elsewhere, by Congress; its construction and equipment, however, remained far from complete.

The U.S. military draft operated in the Territory. The lottery determining the eligibles' numbers for drafting was held in San Juan. The machinery of the governmentally maintained Puerto Rican Lottery was used. Volunteers came forward in such numbers that it seemed likely that they would forestall the conscripts in filling the 4800 required enlistments. The chance of military service offered the specific attraction that army pay and subsistence exceeded the prevailing rate of wages. Nationalist leaders urged resistance to the draft, but with little apparent effect. Another U.S. defensive measure, the registration of aliens, was reported in October to have provoked a rush to seek naturalization, on the part of many of mixed parentage, who had wrongly taken their citizenship in the United States for granted. Such cases might have been more numerous, but for a ruling of the U.S. Commissioner of Immigration, in April, that

children born abroad of native Puerto Rican parents might enter as citizens.

**Education, Lands, Wages and Hours.** The peoples' awareness of the advantage of knowing the English tongue grew by experience. Many of the volunteers for the U.S. Army or Navy found themselves rejected for lack of it. Plenty of Puerto Ricans who had gone to the United States could testify to its usefulness. The new feeling gave point to a dispute about the teaching of the language in the public schools. Dean Osuna, of the College of Education at the University, blamed the teachers with having failed to learn best methods of instructing Spanish-American children in English. Commissioner of Education Gallardo was condemned by the Legislature for slack promotion of English-teaching. He, on his part, declared that to give the children a knowledge of English would require an expenditure for teaching that the budget could not well meet—one that the Federal Government ought to supply. The Governor's report indicated that 514 out of 6030 teachers gave instruction in English. From this it would appear that the schools were paying about \$500,000 a year for teaching English to nearly 300,000 pupils, most of whom would stay less than four years in school; and that thus the schools were engaged in trying to inculcate the English language at the cost of less than \$7 throughout for each pupil.

The landholding issue passed through an active stage: the U.S. Supreme Court upheld a 40-year-old law, long withstood, restricting the areas of individual landed properties to 500 acres. The decision was welcome to small farmers, who looked on the great sugar estates as smothering their class; it gave worry to companies that had invested money in equipment for the production of sugar on a great scale from cane efficiently grown by experts on such estates. One of the main ventures of the Puerto Rican Reconstruction Administration, a scheme of co-operative landholding known as the Lafayette Central, came to grief in August; the participants could not meet the sum required for the first payment on the \$2,000,000 that their holdings had cost. Parts of the land were consequently offered for resale; in December a decision to sell out the whole enterprise to individual owners was announced.

The United States' system of regulating wages and hours was applied actively to Puerto Rico in 1940. As the Island's way of living and scale of earnings differed radically from those in the Union, new regulations led to much protest and some litigation. An extreme case was that of makers of fine needlework, largely for export. These people, working mainly in their homes, numbered possibly 65,000 women; they embroidered or otherwise worked such articles as handkerchiefs, silken underwear, and household linen. They received very little by the hour, according to American standards. An investigating committee from the mainland came, to determine a proper minimum pay in this industry. One of the members, David Dubinsky, said that despite a Territorial law requiring that the needleworkers get at least 12½ cents an hour, most of them had been getting only 2 cents. The committee recommended to the Wages and Hours Division that they receive a minimum rate of 12½ cents an hour for homework and of 20 cents or more for work done in a factory, with some addition for special types of work. Employers doubted the possibility of doing business at the extra cost and threatened to leave the industry. Though the articles that it produced might indi-

vidually sell at high price, such a price did not necessarily give a substantial return on the hours of nice manual work required.

See also BIRTH CONTROL; CHILDREN'S BUREAU; SUPREME COURT.

**PULITZER PRIZES.** A series of awards established in 1915 by the will of Joseph Pulitzer, publisher of the New York *World*, presented annually by Columbia University on recommendation of the advisory board of the Pulitzer School of Journalism, for outstanding achievements in letters and literature.

In 1940, as announced on May 6, the awards in literature were: Novel, *The Grapes of Wrath*, by John Steinbeck; play, *Time of Your Life*, by William Saroyan; history, *Abraham Lincoln: The War Years*, by Carl Sandburg; verse, *Collected Poems*, by Mark Van Doren; biography, *Woodrow Wilson: Life and Letters*, vols. vii and viii, by Ray Stannard Baker. (William Saroyan rejected the prize, on the grounds that he disapproved of patronage of the arts, and the \$1000 awarded to him reverted to the prize fund.)

In journalism, awards were made to Otto D. Tolischus of the New York *Times*, for his articles from Berlin explaining the economic and ideological background of war-engaged Germany; to Bart Howard of the St. Louis *Post-Dispatch*, "for distinguished editorial writing during the year," as exemplified in his editorial "Europe's Emperor," published Mar. 17, 1939; to the Waterbury (Conn.) *Republican and American* "for the most disinterested and meritorious public service rendered by an American newspaper during the year," in recognition of their exposure of graft in the city administration that resulted in trial and conviction of several city officials, to S. Burton Heath of the New York *World-Telegram* "for a distinguished example of a reporter's work during the year," in recognition of his series of articles on Federal Judge Martin T. Manton that were followed by the latter's resignation, indictment, and conviction for accepting financial favors from companies whose affairs were up before him for judicial decision; to Edmund Duffy of the Baltimore *Sun* for a distinguished example of a cartoonist's work, exemplified by his cartoon "The Outstretched Hand," printed Oct. 7, 1940.

Three traveling scholarships, worth \$1500 each and intended to give the recipients a year's foreign travel, were awarded to David D. Newsom of Richmond, Calif.; Ross P. Schlabach, Jr., of Newport News, Va., and Miss Nona P. Baldwin of Montclair, N.J. All are students in the Graduate School of Journalism at Columbia.

**PULP.** See PAPER AND PULP.

**PWA.** See PUBLIC WORKS ADMINISTRATION.

**QATAR.** See under ARABIA.

**QUAKERS.** See FRIENDS.

**QUARANTINE.** See PUBLIC HEALTH SERVICE.

**QUEBEC.** A Canadian province. Area, 594,534 square miles; population (1939 estimate), 3,210,000, as against (1931 census) 2,874,255. Vital statistics (1939): 79,621 living births, 33,388 deaths, and 28,911 marriages. Chief cities (1931 populations): Quebec, the capital (130,594), Montreal (818,577), Verdun (60,745), Three Rivers (34,450), Hull (29,433), Sherbrooke (28,933), Outremont (28,641). Education (1937-38): 715,751 students enrolled in schools of all kinds, including 39,575 in colleges and universities.

**Production.** The gross value of agricultural production for 1939 was \$203,429,000. Field crops,

which covered a total of 6,142,100 acres in 1939, were valued at \$83,376,000. Chief field crops (1939): oats 45,293,000 bu., barley 4,055,000 bu., buckwheat 2,483,000 bu., mixed grains 4,763,000 bu., potatoes 536,850 tons, roots 309,850 tons, hay and clover 4,917,000 tons, fodder corn 559,000 tons. Livestock (1939): 1,817,000 cattle (including 1,002,000 milch cows), 744,000 swine, 647,000 sheep, 297,000 horses, 8,128,000 poultry. Fur production (1938-39) was worth \$2,230,300. Forestry output (1938) was equal to 890,590 M cu. ft. and was valued at \$42,182,132. The fisheries catch in 1939 totaled 48,420 tons and had a marketed value of \$2,011,000 of which cod represented \$633,300.

Mineral production (1939) was valued at \$77,335,998, including gold (953,377 fine oz.) \$34,455,998, silver (1,167,444 fine oz.) \$472,675, copper (117,238,897 lb.) \$11,831,749, zinc (28,758,759 lb.) \$882,606, asbestos (364,454 tons) \$15,858,492. During 1940 Quebec's output of gold was 1,017,386 oz., silver 1,328,854 oz., asbestos 345,581 tons, and cement 3,850,937 bbl. Manufacturing (1938): 8655 factories, 214,397 employees, \$428,614,029 net value of products.

**Government.** Finance (year ended June 30, 1939): ordinary revenue, \$60,836,000; ordinary expenditure, \$55,948,091; net public debt \$252,719,282. The King is represented by a lieutenant-governor (appointed by the governor-general in council) who is advised by a ministry which is responsible to the legislature and resigns office when it fails to have the confidence of that body. In the legislature there are a legislative council of 24 members (appointed for life by the lieutenant-governor) and a legislative assembly of 86 members (70 Liberals, 15 Union Nationale, and 1 Independent elected on Oct. 25, 1939) elected by popular vote. Twenty-four senators (appointed for life) and 65 commoners represent Quebec in the Dominion parliament at Ottawa. Lt.-Gov., Maj.-Gen. Sir Eugène Fiset (appointed Dec. 30, 1939); Premier, Adélard Godbout (Liberal).

**History.** Two loans were floated by the province early in 1940: the first for \$25,000,000 was sold privately; the second, for \$40,000,000 was sold to banks. On May 15, 1940, the city of Montreal defaulted on two payments—one of \$3,000,000 owing to banks and another of \$3,637,300 issued to the public. Steps were taken to alter the financial administration of the city. A law (effective Jan. 1, 1941) was passed on Apr. 25, 1940, which granted women the right to vote in provincial elections and made them eligible for election to the legislative assembly. On Oct. 16, 1940, Premier Godbout brought Hector Parrier into his cabinet as Provincial Secretary and gave to Henri Groulx, Minister of Health, the new portfolio of Minister of Social Welfare. It was announced on Nov. 23, 1940, that the final payment on "seigniorial tenure," a medieval system of landholding brought to Canada in the 17th century, would be paid in November. The Quebec legislature voted to buy all land held under "seigniorial tenure," and to continue to charge rent which would be used to amortize a \$3,000,000 loan made to finance the transaction. In time, according to the government, the tenants would receive title to the land. See CANADA under History.

**QUEENSLAND.** A State in northeastern Australia. Area, 670,500 square miles; population (Mar. 31, 1940), 1,018,362, exclusive of full-blood aboriginals. Vital statistics (1939): 20,348 births, 9530 deaths, 9108 marriages. Chief cities: Brisbane, the capital (326,000 inhabitants on Dec. 31, 1939), Rockhampton (32,526), Townsville (31,-

414), Toowoomba (29,056), Ipswich (22,056). **Production.** Chief agricultural products: sugar (763,242 tons in 1937-38), wheat (6,585,000 bu. in 1939-40), maize, hay, potatoes, cotton, grapes, tobacco, pineapples, oranges. Livestock (1939): 23,500,000 sheep, 6,125,000 cattle, 445,000 horses, 350,000 swine. Wool (as in the grease) production (1940): 190,000,000 lb. Dairy products (1938-39): 157,625,746 lb. of butter, 15,768,543 lb. of cheese, 19,021,752 lb. of ham and bacon. Chief minerals (1939 values where available are given): Gold (£1,428,598), silver and lead, copper, tin, coal (£1,167,844), zinc. Manufacturing (1938-39): 3087 factories, 54,110 employees, £19,301,475 net value of production (£A averaged \$3.8955 for 1938; \$3.5338 for 1939). Railways (1939) totaled 6567 miles.

**Government. Finance:** (1938-39) revenue £19,333,369, expenditure £19,316,323; (1939-40) revenue £20,756,000, expenditure £20,740,000. The public debt on June 30, 1940, totaled £129,033,000. Executive power is vested in a governor who is aided by a council of ministers. There is a legislative assembly of 62 members, elected by universal suffrage. At the election of Apr. 2, 1938, the standing of the political parties was Labor 44, United Country 13, United Australia 4, and Protestant Labor 1. Governor, Col. Sir Leslie Orme Wilson; Premier, William Forgan Smith (Labor). See AUSTRALIA under *History*.

**RADIO.** By Presidential Order the long-talked-of Defense Communications Board was created Sept. 24, 1940. Official statements assured that the Board "is basically a planning agency . . . will have no power to censor radio or other communication or to take over facilities . . . does not propose to interfere with normal operation . . . more than is necessary for national protection." However, the Board "is charged with the important duty of charting the utilization and control of our communications systems in the best interests of the national security," and will function through a system of committees having appreciable autonomy and power. The DCB was designated to consist of the FCC, the Chief Signal Officer of the Army, the Director of Naval Communications, the Assistant Secretary of State in charge of the Division of International Communications, and the Assistant Secretary of the Treasury in charge of the Coast Guard.

Incidental to National Defense, the Federal Communications Commission (q.v.) succeeded in supplementing its original Congressional appropriation of \$2,100,000 for the current fiscal year to an effective level of \$4,000,000 to facilitate the extension of its investigatory and regulatory efforts. That the FCC intends to "crack down" on broadcasting chains under charges of monopoly was indicated by the trend of hearings in progress as 1940 closed. Whereas FOC was created originally to assist in the purely technical problem of distributing the available channels in the radio-frequency spectrum in such a way as to minimize interference between stations or between channels, competent observers are now pointing out that FCC is in a position to do an effective censorship job by the simple expedient of declining to renew any or all of the short-term licenses by means of

which it now controls broadcasting stations. To train some 4000 radio and signal men for the Reserve, the Navy Department announced the establishment of seven schools in different parts of the United States.

Highlight of radio development for 1940 is the emergence of the frequency-modulation ("FM") system of radio broadcast transmission into recognized commercial status. This static-free radio system (see 1938 and 1939 YEAR BOOKS) was declared by the FCC to be "one of the most significant contributions in recent years" when the FCC authorized FM on a commercial basis May 20, 1940. This recognition constitutes a fitting tribute to the able and courageous pioneering efforts of Maj. E. H. Armstrong and his associates. The frequency band—from 42,000 to 50,000 kilocycles—assigned to FM by FCC is intended to provide 40 FM channels each 200 kc wide, 35 for regular broadcast service and 5 for non-commercial stations. This number of FM channels is considered to be adequate for complete United States coverage because FM stations can be located within 300 miles of each other without serious interference. To provide for FM relay channels, the frequency bands of from 156 to 168 megacycles and above 300 mc also were assigned to FM. Although FM broadcasting was authorized to begin Jan. 1, 1941, the formulation of governing rules and regulations involved some delay. As of Dec. 6, 1940, a total of some 25 construction permits had been issued by FCC for FM stations, and 46 addition applications had been filed. Its noise-free characteristic is making FM especially attractive for use in mobile equipment for police, fire, public-utility emergency, and military services.

A new record was established in 1940 by the radio manufacturing industry in the sale of some 11,000,000 receiving sets, bringing the estimated total of such sets in the United States to 52,000,000. Receivers are being made in various combinations of broadcast and short-wave radio, television, and record-playing equipment. The size range has been extended—downward to a 4½-lb. 150-milliwatt "camera-case" portable, and upward to a full combination of the above-noted equipment camouflaged in a large piece of period furniture of top quality and fitted with two or more speakers to provide full tone response with an output of 50 watts or more. In general, engineering improvements resulted in receivers having better tone, power, and performance.

Radio has felt the influence of war and is playing a vital rôle in providing direct voice control of distant and highly mobile military units. The impact on the industry is reflected in the report that by the close of 1940 vacuum tubes were being turned out at the rate of 400,000 per day. Among short-wave developments for 1940 is a 50-kw international broadcasting station at Brentwood, Long Island, N.Y., a joint project of Columbia Broadcasting System and Mackay Radio Telegraph Co., designed to provide 13 different frequency channels which may be selected for use at any time to suit vagaries of atmospheric conditions. Also, station WBZ near Boston installed 50-kw equipment for short-wave international broadcasting and two additional 50-kw transmitters, one for conventional amplitude-modulation broadcasting and one for frequency-modulation.

**RADIO PROGRAMS.** Although this review of 1940 is concerned with America, the marked influence of the European war upon broadcasting cannot be overlooked, since radio today is international in scope. In the United States, radio within the year 1940 became the voice of national defense.

Broadcasting, as conducted under the Stars and Stripes, is appraised as an outstanding demonstration of democracy in action. The American people are free to listen to whatever they choose. There is no censorship of the programs broadcast by more than 800 stations serving approximately 50,000,000 receiving sets, 8,000,000 of which are in automobiles. The result is that American people are the best informed in the world.

Statistics indicate that approximately 10 per cent of radio's time in 1940 was consumed by talks, while at least another 9 per cent went to news—an increase of 5 per cent over 1939. Because the year had a Presidential campaign, war in Europe, and a drive for national defense in the United States, there was plenty of talk on the wave-lengths. Despite the activity and divergent opinions presented by a wide variety of organizations and individuals, the broadcasters operating under their code of equality in presenting controversy, came through the year a marked credit to the American system of broadcasting. All sides seemed to be satisfied that radio in the United States had operated fairly, unbiased and uncensored.

The policy of handling news at definite periods operated to the satisfaction of the majority. Fewer flash bulletins interrupted the regular programs. Commentaries from Europe also were handled generally at specific periods. Censorship muzzled Europe's microphones and stripped from broadcasting much that otherwise might have been interesting. There was little reason, therefore, to assign more time to the overseas reporters. War news supplied by the press associations, however, increased because of the tremendous public interest in national and international affairs. World history in the making was constantly before the American listening public throughout the year.

The various round-table discussions, public forums, and ethereal platforms aimed at greater freedom in expression in an effort to become less "frozen." Current events demanded more time from radio for "civic discussion." Aid to Britain, a two-ocean Navy, the care of refugees, feeding of Europe, and the acquiring from Britain of defense bases in this hemisphere, were only a few of the subjects, the pros and cons of which were broadcast coast-to-coast to assist in the formulation of public opinion. Incidentally, of the news analysts, Raymond Gram Swing, H. V. Kaltenborn, Lowell Thomas, and Elmer Davis were favorites among radio critics.

Radio is preserving a sound record of this war, not obtainable from 1914-18. The declarations of war and the historic speeches that followed are etched on discs for posterity. Electrical transcribing has become an essential branch of the radio business: More firms are supplying transcriptions, and more sponsors are turning to the prepared-in-advance program recorded on discs.

Oddly enough, the 1940 daily pattern of broadcasting remained quite routine or stable; in fact,

about 75 per cent of the time was allocated in advance without unforeseen events upsetting the scheduled programs. On an average, slightly more than 20 per cent of radio's time was devoted to education, which the broadcasters prefer to call "public service programs," since the word "education" is said to frighten listeners into believing that something highbrow is about to be broadcast. In the year-end polls, the American School of the Air, University of Chicago Roundtable, American Town Meeting, and Damrosch Music Appreciation Course, were tops.

About 20 per cent of the time went to drama which in 1940 became more professional, attracting specialists in playwrighting for radio as an art form. To embellish their efforts, greater attention was given to selection of talents. Helen Hayes took to the air in a new series of plays; Katherine Cornell was heard in her radio debut. The "Radio Theatre" directed by Cecil B. DeMille, ranked on top in popularity surveys on drama.

Music, recognized as the backbone of broadcasting, consumed about 55 per cent of 1940's radio time, with 25 per cent of it classical, 75 per cent popular. The NBC Symphony directed by Arturo Toscanini, the New York Philharmonic, and Metropolitan Opera were outstanding in the classical field. "Soapbox operas" and "washboard dramas" continued to fill the air in the daytime, luring the audience to wait from day to day for the solution of a triangle or romance. These continued serial stories change on a 15-minute schedule; the broadcasters justify the great amount of time they get by the fact that they are in general true-to-life, and people hear their own problems and those of their neighbors unfold. "One Man's Family" and "the Aldrich Family," on evening schedules, ran ahead among the serials, with "Vic and Sade," third. See MUSIC under *General News*.

The quiz programs, topnotch among them "Information Please," "The Quiz Kids," "Dr. I. Q.," "Take It or Leave It," and "Kay Kyser's College," continued to attract the invisible crowds. The year added to the number of audience-participation programs. In many instances this trend "loosened up" radio and made it more informal, less dependent upon prepared and rehearsed scripts; the programs became more natural and more extemporaneous.

In the United States, the gross revenue of the broadcasting industry for 1940 is estimated at more than \$207,000,000. As an indication of how much of radio broadcasting is commercial, the National Broadcasting Company reports for 1940 that approximately 33.4 per cent of the hours were commercial, and 66.6 per cent sustaining. On the networks, news broadcasts showed the most notable gain. Drama and comedy also picked up more time compared with 1939. Speaking of comedy, Jack Benny led the jesters in 1940 popularity polls, with Bob Hope, Fred Allen, and Eddie Cantor also high up in the parade. Charlie McCarthy, leader in recent years, relinquished leadership among the jesters, dropping several places.

Contributing to the strengthening of the solidarity of the Americas, stations in the United States increased the power of their transmitters and improved the efficiency of their directional beams. Internationally, the American waves are aimed to foster friendship and good trade relations among the neighbors of the Western World.

Just as each year in radio is remembered for some dramatic broadcast, probably the one for which 1940 will be recalled, was the one of June

22, from Compiegne, in the forest 45 miles north of Paris. There, radio observers stood around the historic "Armistice car" of the World War to broadcast a stirring eye-witness description of the dramatic meeting of the Germans and French—this time with German Army officers dictating the terms, at the table along which Foch sat in 1918. Here was a reversal in history, and this time all the world might listen-in.

Television, though unauthorized to operate on a commercial basis, made history however, and so 1940 will be recorded as the year in which the NBC's radio camera entered the political arena, first to telecast the GOP Convention at Philadelphia. Films of the democratic conclave in Chicago were flown to New York for telecasting. To top off the television performance, President Roosevelt was seen on the air at the Democratic rally in Madison Square Garden, and a week later Wendell Willkie, the GOP candidate, was televised at the same site. These events inspired the comment that as "a social and political event they may be regarded in the future as a milestone in human affairs." It was estimated that for the first time 10,000 persons in New York and vicinity witnessed by television the nomination of a candidate for the Presidency. By television, the election returns also were illustrated on the air for the first time. Radio cameras focused on charts, figures, and a huge score board, while teletype machines of press associations were seen feverishly typing the bulletins.

**RAILWAYS.** The Military Transportation Section of the Association of American Railroads was established Aug. 1, 1940. A. H. Gass was appointed Manager. It was located in the Quartermaster General's office at Washington, D.C. The avowed object was to make it unnecessary for the Government to take over the operation of the railways in case of war. The memory of what happened when the Government took over the operation of the railways in the World War was unpleasant enough both to railway owners and railway users to induce them to try to avoid it in the present crisis.

"Are the railways in physical shape to meet adequately the strain of war conditions?" was the question asked of railway officers more frequently than any other in 1940. J. J. Pelley, President of the Association of American Railroads speaking in Chicago on Oct. 10, 1940, said that the railways had ample line haul capacity and that they had ample terminal capacity, provided that freight be unloaded promptly upon arrival. He explained that while the railways had 628,000 fewer cars and 22,000 fewer locomotives than in 1918 the cars are much larger and the locomotives are nearly half again as powerful now as at that time. He said that in October, 1940, there were 1,503,055 serviceable freight cars on line.

It is a fact that in the last eight years maintenance expenses of railways have been drastically cut, but the contention is that the cuts were at the expense of fine housekeeping and did not impair efficiency. Sufficient rail, tie, and ballast renewal was made for high speeds and heavy trains, but the ballast toe line was left ragged and stations were not repainted. Inspection shows that the main lines

serving the eastern ports are in first class condition. There was no apparent let down in main line operating standards. The Pennsylvania Railroad and the New York Central will bear the brunt of the movement of material to the seaboard. The average car miles per day in 1939 on the Pennsylvania was 21.7 and in 1940 was 22.7. On the New York Central it was 31.7 in 1939 and 36.6 in 1940. Freight train speeds have been very much stepped up in the last few years through the use of the 2-8-4 type of locomotive in freight service and through the use of the superheater. In 1940 many freight trains were scheduled at 40 to 45 miles an hour which means that at times they made speeds of 60 miles an hour.

Special attention during 1940 was given to yard operations, for these have been the bottlenecks of railway freight movement. The factors that did most to improve yard operation in 1940 were car retarders, Diesel-electric switching locomotives, flood lights so that yards could be worked 24 hours a day, telephones and teletypes with central control of signals and switches in yards, and truck motors for car riders so that a minimum of time would be lost in returning from the terminus of one job to the starting point of another. By the middle of 1940 there were 31,000 freight cars with Duryea cushioned underframes. The damage to freight caused by shocks in switching yards has been large; the cushioned underframe greatly reduces it.

Diesel-electric car ferries across the Great Lakes have opened new routes between the Mississippi valley and the Atlantic seaboard. There are now 45 pairs of cities having overnight freight service; the shortest distance covered by this overnight service is between Denver and Minturn, Colo., 302 miles and the longest between St. Louis, Mo., and Texarkana, Ark., 551 miles. As an alternative to all-rail movement of material from the West, mention should be made of the Seatrain put in service March 1 between Texas City on the Gulf and New York. The Seatrain is 500 feet long by 66 feet broad. Freight cars are loaded onto it by electric crane.

There was a test of the capacity of railways for troop movement in August, 1940, when 150,000 men (troops in maneuver) were carried by railway in three days. This average of 50,000 a day compares with an average of 37,000 a day at the peak of the troop movement in 1918.

**Truck Service.** The co-ordination of trucking service with railway service in facilitating movement of material under war condition is important but not susceptible of precise measurement. While competition between railway and truck is still active there was a noticeable trend in 1940 toward a supplementing of one service by the other. Co-ordination is being retarded by an interplay of forces; on the one hand railway companies are trying to maintain a transportation monopoly, and on the other animosity against railways is hampering them in extending transportation by the use of trucks. In June, 1940, the Interstate Commerce Commission (q.v.) adjudged unlawful railway tariffs providing for pickups by trucks of livestock in Illinois, Iowa, and Wisconsin destined to Chicago. The reason given was that the trucks were subject to the Motor Carrier's Act and thus they "are being conducted without lawful authority, since no certificate that public convenience and necessity require such operations has been sought or obtained."

There was a strong minority opinion, however,

which pointed out that this was in effect a step toward co-ordination of transportation services. The majority took the view that it was an attempt to cut rates rather than co-ordinate transportation. Without going into technicalities, the railways by extending their terminals to points ten miles from the railway made a bid for part of the haul on livestock. The minority laid stress on the "public convenience" that would follow. The majority laid stress on the fact that the railways would not entirely lose the competitive livestock business to the trucks.

On its Delmarva division, which serves the peninsula extending south from Wilmington, Del., to Cape Charles, Va., the Pennsylvania Railroad operates a co-ordinated truck and railway service where truck lines extend to territory not reached by railway and also parallel railway lines but do only a local business, thus relieving the railway of the necessity of running a non-profit-earning local freight train. It is an important development because it suggests a form of co-ordination that has nation-wide possibilities.

In the west the Missouri Pacific Railroad has put fleets of trucks in operation. Both a truck line and a railway, operate from Houston to Freeport, 62 miles, with truck lines to other nearby cities. Other truck lines handle merchandise from distributing points such as Dallas, Beaumont, Fort Worth, San Antonio, Waco, St. Louis, Memphis, Little Rock, and New Orleans. Through the Missouri Pacific Freight Transport Company a flexible freight service is furnished for much of south-east Texas, which also furnishes transport for perishables through the medium of small refrigerator units carried by truck.

A larger refrigerator unit is being used in the East. The M. H. Renken Dairy Company of Brooklyn, N.Y., has placed in service fourteen 3000-gal demountable milk tanks. These tanks can be shifted from truck to flat-car and from flat-car to truck to give co-ordinated rail and truck service. The National Dairy Products Corporation is using a like device, so that by October, 1940, over 50,000 gal. of milk were being shipped daily to the New York metropolitan area by this new system which combines long haul rail service with short haul trucking.

A report of the Bureau of Motor Carriers' Section of Finance before the Interstate Commerce Commission recommends, under conditions to protect labor, that the Commission approve the applications of the Transport Company of New York to acquire various motor carriers operating over a network of routes extending along the Atlantic seaboard from Massachusetts to Florida and into Ohio, West Virginia, Tennessee, Louisiana, and Alabama. In all there are 56 companies operating more than 10,000 vehicles. The report recommends that the Commission deny a supplemental application to effectuate singleness of title to the operating rights of the motor carriers involved. The bankers for the proposed merger are the bankers for the Pennsylvania Railroad.

**Diesel Locomotives.** The use of oil-electric (Diesel) locomotives is complementary to the use of highway trucks in that it gives the railways flexibility for on-line service as the truck gives the railway flexibility for off-line service. This does not include the use of the Diesel in switching yards, where the Diesel is simply an improved tool for doing the same work heretofore done by the steam locomotive. In line haul work the Diesel adds a new service.

On Jan. 1, 1940, there were 57 Diesel locomotives on order for 16 railways. During 1940 there were 462 Diesel locomotives ordered by 60 railways. The trend was towards the use of more powerful units. Prior to 1939 the favored unit was 600 h.p. By the end of 1940 it was generally conceded that the 1000-h.p. unit was the more economical. The official tests that were made used 600-h.p. and 900-h.p. units, but it was thought that the superiority of the more powerful unit over the 600-h.p. unit would be more notable if the 1000-h.p. unit had been used in the comparison.

The gal. of fuel oil burned by the 600-h.p. unit per hour of work was 5630; the 900 h.p.-unit used 6371 gal., but the cost of repairs per hour of work averaged 30.38 cents for the 600 h.p.-unit and 27.55 cents for the 900-h.p. unit. In other words, with an increase of 50 per cent in power there was an increase of but 13 per cent in fuel cost and an actual decrease in cost of repairs.

The accusation that railways have been remiss in providing adequately for the strain of war is met, not only by citing improvements such as the Diesel locomotive, but also by pointing to the fact that Class I railways in the first five months of 1940 bought nearly \$400,000,000 of supplies of which \$284,160,000 was for materials and \$112,143,000 was for fuel-oil and coal.

**Transportation Act of 1940.** The Transportation Act of 1940, known as S.2009 while it was under discussion, was passed by both houses of Congress and was signed by the President on September 18. The Act provides for the appointment by the President of a three-member board to study the relative economy of various agencies of transportation, and government aid to transportation. It conditionally repeals land-grant rates and relieves the Interstate Commerce Commission of the duty of making proposed consolidations conform to its general consolidation plan. [As noted in previous YEAR BOOKS this duty, as interpreted by the Commission, had heretofore effectively blocked all important consolidations.]

The Act provides for the regulation of water carriers on much the same comprehensive scale as railways and motor carriers. Thus railways, highway motor carriers, and waterways are brought under regulation in respect to permits to operate, accounts, and rates. The Commission is permitted to make exceptions for water carriers that transport commodities in bulk by contract on the Great Lakes. Water carriers are required to make joint rates with railways and may establish joint rates with motor carriers. Minimum rates may be ordered by the Commission as well as maximum rates. Foreign competition may be taken into consideration by the Commission.

In two respects the Transportation Act of 1940 departs radically from former regulation of railways. In giving a basis for judging rates to the Interstate Commerce Commission the act says: "In the exercise of its power to prescribe just and reasonable rates the Commission shall give due consideration, among other factors, to the effect of rates on the movement of traffic by the carrier or carriers for which the rates are prescribed, to the need, in the public interest, of adequate and efficient railway transportation at the lowest cost consistent with the furnishing of such service; and to the need of revenues sufficient to enable the carriers, under honest, economical management to provide such service."

Gone is valuation of railway property as a basis of rate making. One has only to remember the

years of wrangling over cost of reproduction new or original cost as a basis on which to allow earnings of 6 per cent. Theoretically, just rates are discarded in favor of rates that will move the traffic and induce continued investment in railway facilities. The words "among other factors" should be noted however. It is still within the discretion of the Interstate Commerce Commission to give weight to each of the different factors. Apparently Congress for the first time has recognized that the ICC acts in a managerial capacity. Heretofore Congress saw the ICC only as a curb on the railways.

The second respect in which the Transportation Act of 1940 differs radically from any former regulation of railways is contained in the declaration of policy in the Act:

"It is hereby declared to be the national transportation policy of the Congress to provide for fair and impartial regulation of all modes of transportation subject to the provisions of this Act, so administered as to recognize and preserve the inherent advantages of each; to promote safe, adequate, economical, and efficient service and foster sound economic conditions in transportation and among the several carriers; to encourage the establishment and maintenance of reasonable charges for transportation services, without unjust discriminations, undue preferences or advantages, or unfair or destructive competitive practices; to cooperate with the several states and the duly authorized officials thereof, and to encourage fair wages and equitable working conditions—all to the end of developing, coordinating, and preserving a national transportation system by water, highway and rail, as well as other means, adequate to meet the needs of the commerce of the United States, of the Postal Service, and of the national defense. All the provisions of this Act shall be administered and enforced with a view to carrying out the above declaration of policy."

Vitaly important as this declaration of policy was, there were some pessimists who discounted it because, in the same year in which it was made the law, a report by J. B. Eastman was made public that covered government aid in 1936 which showed, the pessimists thought, how the policy might be falsified. The Eastman report estimated that the railways had been aided by the government to the amount of \$35,635,000, the waterways to the amount of \$128,528,000, airways to the amount of \$21,453,000, and motor vehicles to the amount of \$8,000,000. The pessimists said that if an Interstate Commerce Commissioner, past or present, could estimate that motor vehicles had been aided only to the extent of \$8,000,000, then a mere declaration of policy by Congress could be brushed aside as window dressing.

The estimate obviously assumed that the taxes of motor vehicles paid their share of the interest on the cost of construction of 3,000,000 miles of highways and their share of the cost of maintenance of these 3,000,000 miles. The pessimists pointed out that while the railways also paid taxes, they were compelled to charge rates that would cover interest on the cost of construction of the roadbed they used and also cover the cost of the maintenance of that roadbed. Under such an assumption the words "unfair . . . competitive" would be meaningless. The fact remains, however, that in 1940 Congress recognized that railways were desirable in a national transportation system and that they must be encouraged as well as restrained.

**Railroad Retirement Board.** On October 10 the President signed amendments to the Railroad Unemployment Act which increased payments by the Railroad Retirement Board to unemployed railway workers. In a press release, dated October 21, the Board said:

The Board estimates that over a period of years the effect of the amendments will be to raise benefits on the

average by about 75 per cent. In any given year, however, the increase in benefits resulting from the amendments may be greater or less than this average depending upon the number of unemployed workers and the length of their periods of unemployment.

The important increase in the benefit rights of unemployed railroad workers is made without increasing the contributions from employers which maintain the system. It is estimated that the present contribution rate of 3 per cent of the payroll, exclusive of the excess over \$300 in monthly earnings per employee, will be sufficient to support the higher level of benefits.

In making this estimate it is evident that the Board relied on increased railway employment which would at the same time increase the number of payments into the benefit fund and decrease the number of payments from the benefit fund.

But even discounting estimates for the future the results achieved in the past and the current position of the Board was thought to justify an increase in benefits. The October, 1940, *Monthly Review* of the Railroad Retirement Board gives the amount of tax collections under the Carriers Taxing Act cumulative through September, 1940, as \$412,869,059, and the total and retroactive payments as \$338,154,367, leaving \$74,714,692 excess collections over payments. These payments were divided: Employee Annuities \$234,091,003, Pensions \$95,605,724, Survivor Annuities \$2,373,631, Death Benefit Annuities \$1,990,759, and Lump-Sum Death Benefits \$4,093,248.

Of the administrative expenses of the Board the October, 1940, *Monthly Review* says: "Of the \$2,536,000 appropriated by Congress for administrative expenses of the retirement system for the fiscal year ending June 30, 1941, a total of \$647,318 had been expended or obligated for expenditure by the end of September." The *Review* also says: "Retirement account assets at the end of September consisted of \$85,400,000 invested in 3 per cent special Treasury notes and an unobligated cash balance of \$12,490,847, in addition to a balance of \$77,530,000 in the amount appropriated by Congress for the current fiscal year."

"Employee annuities totaling 109,738 with a monthly amount payable of \$7,193,887, were in force at the end of September." [1940] This is apparently a monthly payment of \$65.56.

At the end of June, 1940, there were 35,146 retirement pensions in force—the average pension was \$58.66 per month. Through June 28, 1940, the Railroad Retirement Board certified the payment of 1,000,378 claims for unemployment insurance. The average amount paid was \$14.80.

**National Mediation Board.** The National Mediation Board, created in 1934, consisting of George A. Cook (Chairman), Otto S. Beyer, David J. Lewis, with Robert F. Cole Secretary, made its annual report for the fiscal year ended June 30, 1940. The Board disposed of 93 cases, of which 9 covered negotiations of new cases (rates of pay, working conditions, etc.), 51 changes in rates of pay, 32 changes in existing agreements, and one miscellaneous case. There was only one minor strike occurring among employees subject to the Railway Labor Act.

The three types of disputes subject to the jurisdiction of the National Mediation Board are: (1) Disputes among employees concerning their duly authorized representative; (2) Disputes between carriers and their employees over negotiations for new agreements or changes in existing agreements; (3) Interpretation of mediation agreements where differences arise between carriers and their employees as to the meaning or application of such agreements. In all there were 182 disputes and, as

noted above, 93 of these were settled by inducing the parties to make mediation agreements. There was appropriated \$230,406 for the NMB for the fiscal year ended June 30, 1940. The Board's operating expenses were \$149,502.

The difference in functions between the National Mediation Board and the National Railroad Adjustment Board are important. Labor agreements consummated as a result of direct negotiations between carriers and their employees, if in dispute, are subject to the jurisdiction of the National Adjustment Board. Agreements arrived at with the help of the National Mediation Board, if in dispute, are subject to interpretation by the Mediation Board itself. The U.S. Supreme Court has upheld the National Mediation Board.

**Earnings and Expenses.** The following figures are for Class I railways which operate 234,031 out of the total 249,826 miles of railway in the United States. In 1940 total operating revenues amounted to \$4,275,000,000, compared with \$3,995,000,000 in 1939. Total operating expenses in 1940 amounted to \$3,090,000,000, compared with \$2,918,000,000 in 1939.

Income Account	1940	1939
Total Operating Revenue	\$4,275,000,000	\$3,995,000,000
Freight	3,520,000,000	3,251,000,000
Passenger	415,000,000	417,000,000
Total Operating Expenses	3,090,000,000	2,918,000,000
Maintenance of Way	500,000,000	467,000,000
Maintenance of Equipment	817,000,000	766,000,000
Transportation	1,500,000,000	1,418,000,000
Net Railway Operating Income	650,000,000	589,000,000
Net after Fixed Charges	155,000,000	95,000,000

#### New Construction and Lines Abandoned.

Twenty-six miles of new lines were built in the United States in 1940 as against 58 built in 1939. Lines abandoned totaled 1299 miles as against 1783 miles in 1939.

**Locomotives Ordered.** The total number of locomotives ordered was 782 comparing with 469 ordered in 1939. Of the 694 which were ordered for use within the United States in 1940, 219 were steam locomotives, 462 Diesel-electrics, and 13 electrics.

**Locomotives Built.** There were 560 locomotives built in the United States in 1940 and 355 built in 1939.

**Freight Cars.** Freight cars ordered totaled 67,591 in 1940 as against 62,914 ordered in 1939. There were 56,603 freight cars built in 1940 and 27,236 built in 1939.

**Passenger Train Cars.** Passenger-train cars ordered totaled 370 in 1940 and 435 were ordered in 1939. The passenger cars built in 1940 were 200 in number, 221 in 1939.

**Finance.** No railway receiverships were established in 1940. One of the reasons for this is that at the beginning of the year there were 76,907 miles of railway already in the hands of receivers or trustees. During the year 6 companies with a total mileage of 3675 were taken out of the hands of the courts. Three of these were important railways: the Mobile and Ohio; the Chicago, Great Western, and the Chicago-Eastern Illinois.

With the exception of the sale of equipment trusts no new financing for railways was done in 1940. There were only two important dividend changes: the Pennsylvania Railroad paid \$1.50 a share on its \$50 par value shares, and the Atchison Topeka and Santa Fe resumed payments on its common stock with a payment of \$1 in November, 1940. Total dividend disbursements in 1940 were a

little over 90 million dollars and in 1939 were a little less than 75 million dollars.

**European Railways.** While no reliable figures for the operation of European railways in 1940 were available, certain general conclusions may be drawn from the news. English railways were maintained at a very high standard. Right of way (permanent way, they call it) has been more rigid than called for by American practice. It was not allowed to deteriorate with the falling off in traffic; cars and locomotives were kept in excellent repair. In contrast to this the Russian railways were under-maintained or lavishly extended as was thought expedient. Under the strain of troop movement for the conquest of Finland, the Russian railways were quite incapable of handling the soldiers, and their supplies and ordinary traffic was almost entirely neglected. Under the strain of troop movement to France, the English railways were able to handle, not only military traffic, but also ordinary freight and passenger traffic with almost no delays.

See ACCIDENTS; BRIDGES; BUSINESS REVIEW; VERMONT. An account of the major accidents is given by date under CHRONOLOGY.

WILLIAM E. HOOPER.

**RAPID TRANSIT.** To the list of cities having subways or underground railways, Chicago will soon be added, the date set for completion being June 30, 1941. However, the new lines are not for a separate local transportation system, but are mainly to provide for connecting the several elevated railways by means of subways through the congested business district. Of the total length of 8.75 miles for two lines, 6.78 miles were completed in January, or 13.56 miles of single track and tunnel. Twin tunnels are driven, each track having its own "tube." The estimated cost is \$57,400,000, of which \$34,270,000 is to come from the city's traction fund, and the remainder is a grant from the Federal government.

One line runs north and south under State St., 4.9 miles, with 16 stations. The other line comes down Milwaukee Ave., south on Dearborn St., and then west on Congress St. to a loop or turnaround at Wells and Market Sts. This line is 3.8 miles long, with 13 stations. A deep-level system was adopted, the tunnel tracks being about 45 ft. below the streets. At stations, there is a mezzanine floor 18 ft. below the street for ticket offices and other facilities. A proposed new company, to be formed by merger of existing separate traction companies, is to operate the subways as part of a unified local transportation system. This company would assume the cost of tracks, signals, and station equipment.

In New York, the underground railways were extended, about three miles in Manhattan and the same length in Brooklyn, while some 25 miles of the older elevated lines were removed, having been superseded by modern subway lines. The city took possession of the Interborough system in June, thus completing the unification of all the rapid transit lines. The new 6th Ave. subway from 9th to 53d Sts. was opened on December 15; although only 2½ miles long, it cost \$46,800,000 owing to value of property and difficulties of construction.

Street railway lines make but little progress, and in several cities they are being superseded to varying extent by motor-bus lines. This is the case in New York and Brooklyn. In Chicago, it is proposed to convert 250 to 300 miles of street-car routes to bus lines, and the Chicago & West Towns Ry. has substituted buses on 12 miles of its former track routes. Traffic congestion in parts of New

York, due to the use of the streets by suburban bus lines, has led to regulations restricting such use and requiring these bus lines to use terminal stations.

Substitution of trackless-trolley operation for street-car operation has been effected on a considerable scale at Milwaukee, Wis. Classification of local traffic in cities of the United States, for 1940, has been given as follows: Street railways 46 per cent, motor bus 32, elevated and underground lines 18, and trolley bus or trackless trolley 4 per cent.

To extend its rapid transit system, the city of New York has purchased part of the defunct New York, Westchester and Boston Railway, and will convert it from the original trolley line system to the third-rail system, to conform to the equipment of the city lines. See ILLINOIS; NEW YORK.

E. E. RUSSELL TRATMAN.

**RATIONING.** See CHEMISTRY, INDUSTRIAL; LIVING COSTS AND STANDARDS; AUSTRALIA, BELGIUM, BOHEMIA AND MORAVIA, BULGARIA, DENMARK, FINLAND, FRANCE, GERMANY, GREAT BRITAIN, HUNGARY, IRELAND, ITALY, JAPAN, NETHERLANDS, NEW ZEALAND, NORWAY, RUMANIA, SLOVAKIA, SPAIN, SWEDEN, SWITZERLAND, and YUGOSLAVIA under *History*

**RAYON.** Chemically produced fibers, which have won world acceptance under the generic term rayon, achieved another year of expansion in both production and consumption of all types of yarns. The most remarkable circumstance in this connection is that the increase in volume was independent of any influence of "war-orders." Other important textile fibers, including cotton, wool, and silk, have figured in the government contracts for clothing and other raw materials. Rayon, as the latest type of fiber, has served to meet every demand that has been made upon it by the textile mills whether operating on cotton, wool, or silk, and has proven itself to be universally adaptable.

In considering the industry in America, it is necessary to keep in mind that all of the prerequisites for its manufacture are available in ample quantities in this country and are not affected to any degree by importation from the Eastern Hemisphere. Wood pulp and cotton linter, the bases for all rayons, have remained at reasonable price levels, and all of the chemicals necessary for their conversion into yarn have been free from hysterical price advances.

For the year 1940, production of all types of chemical filament yarns and rayon staple fiber yarns, totaled over 465 million lb. Stocks in the hands of yarn spinners, at the close of the year, were non-existent, and sales into 1941 have taken production through January and February and into March. The installed capacity of rayon and other chemically produced yarn plants in the United States, as of Jan. 1, 1941, is reported as 600 million lb. per year.

Due notice should be taken of the marked achievements of the past year in the use of rayon staple fiber. It has been used to a greater extent in the past 12 months in connection with wool in blends running as high as 40 per cent rayon and 60 per cent wool than in any other year. The resulting fabrics have been used in women's wear, suitings, and cloakings, men's overcoatings and suitings, and in a wide line of upholsteries. Another outstanding record is that achieved by rayon staple fiber in the production of cord tires for autos, buses, and trucks, and the adoption of rayon

staple fiber especially crimped for use in the carpet and rug industry. Manufacturers of floor coverings now announce that they have solved all problems in the use of rayon staple fiber, the last of which was overcome when it was given a permanent curl which heretofore has been solely a property possessed by coarse wools. With resiliency, the use of rayon staple fiber in the carpet industry becomes of major importance.

Close to 60,000 men and women operatives are assured of year-round employment in this industry, at the highest wage prevailing for work of similar character in any other textile or chemical plants.

FRANCIS A. ADAMS.

**RECLAMATION, Bureau of.** The Bureau of Reclamation is engaged in the construction, operation, or supervision of the operation of 68 irrigation projects or divisions of projects in 16 arid and semiarid States in the West, which will furnish ultimately a full or supplemental water supply to approximately 10,000,000 acres of thirsty land. The funds for this work have come from repayments by the water users, from oil leasing and other mineral operations, from the sale of public lands, and by allotments and direct appropriations by the Congress. The money expended is returned to the U.S. Treasury for deposit in the Reclamation Revolving Fund by payments of settlers and from sales of power and water.

During the 1940 fiscal year the Bureau of Reclamation continued its major construction program. Work was in progress on 27 projects in 13 States. Thirteen major storage dams and one diversion dam were under construction during the year. Of these, four for storage and the one for diversion were completed. Four of the storage dams under construction are of tremendous size. They are Grand Coulee, Shasta, Friant, and Marshall Ford. Grand Coulee will be the largest concrete dam in the world, while Shasta and Friant Dams will be second and fourth largest; and Marshall Ford will be fifth. Boulder Dam, although ranking first in height, is third largest.

Since 1902, the Bureau of Reclamation has completed the following construction: 161 storage and diversion dams; 51 power houses; 3058 buildings; 20,575.9 miles of canals, ditches, and drains; 87.8 miles of tunnels; 4802.5 miles of telephone lines; 300.5 miles of dikes; 6377 flumes; 21,525 culverts; 13,912 bridges; and 202,491 other irrigation structures. Reservoirs on Federal irrigation projects had a combined capacity of 51,215,000 acre-feet at the end of the fiscal year.

An outstanding project under construction is the Columbia Basin project, designed to provide water for the irrigation of 1,200,000 acres of dry land in central Washington and for the generation of large blocks of cheap hydroelectric power for irrigation pumping requirements, and industrial and urban consumption. Rising to a height of 553 feet and stretching across the Columbia River 4300 feet, Grand Coulee Dam was nearing completion at the end of the fiscal year. Looking forward to the time in 1943 or 1944, when water may be available for the irrigation of the first block of lands included in the project area, the Bureau of Reclamation in July, 1939, launched joint investigations of the Columbia Basin Irrigation project. The object of the investigations is to plan for the successful settlement and development of the project area, which it is expected will support an increase of 350,000 in population of the State of Washington.

Another major undertaking of the Bureau in progress is the Central Valley project in California, designed to alleviate critical water shortage and problems in three important agricultural areas through the conservation of waste flood waters of the Sacramento and San Joaquin Rivers. By means of Shasta Dam in the north and Friant Dam in the south, regulation of both the Sacramento and the San Joaquin Rivers will provide adequate water to supplement the irrigation supply of a large area of highly productive orchard and farm lands in the southern San Joaquin Valley; re-establish navigation to Red Bluff on the Sacramento River; prevent salt water intrusion in the irrigation channels of the delta of the Sacramento-San Joaquin Rivers; provide supplemental water for irrigation, domestic and industrial uses in other areas, and make possible the generation of 375,000 kilowatts of water power at Shasta Dam. At the end of the fiscal year construction work was about 40 per cent complete on Shasta Dam, to be 560 feet in height, and 3500 feet in length along the crest. The work in progress also includes the 46-mile Contra Costa Canal, the Southern Pacific Railroad relocation around the Shasta Dam reservoir site and Friant Dam, to be 320 feet in height and 3430 feet in length. See DAMS

Boulder Dam, with 8 largest generating units and 1 smaller one in operation had almost doubled its output during the fiscal year, generating 2,834,248,000 kilowatt-hours of electrical energy. With 8 large generators in operation, the present installation includes 6 of the large 82,500 kilovolt-ampere generating units in the Nevada wing and 2 of the large and 1 of the smaller 40,000 kv-a generating units in the Arizona wing, totaling 700,000 kw. Ultimately there will be 15 of the large and 2 of the smaller generating units in operation with a capacity of 1,317,500 kw. Present power contracts will not only return the cost of Boulder Dam and Power Plant to the Federal Government with interest but will also pay certain revenues to the States of Arizona and Nevada.

The 80-mile All-American Canal, by far the largest irrigation ditch in the United States, is practically completed. This canal with its 130-mile Coachella Branch will carry Colorado River water to irrigate lands in Imperial and Coachella Valleys in southern California. Work on the second 40-mile section of the Coachella Canal was about a third completed at the end of the fiscal year.

The population of the 53,205 irrigated farms and the 258 towns and cities served by Federal projects reached a total of 837,617 persons. Of the 3,140,976 acres irrigated, 3,078,072 acres were harvested in 1939, producing crops worth \$114,082,794, or an average of \$37.06 per acre.

Under the present construction program, the largest in the Bureau's history, water will be provided for about 2,500,000 additional acres, transforming them from sagebrush wastes into productive farms that will support approximately a million people. This will bring to 5,000,000 acres the total of new lands the Bureau has watered. Supplemental water will be supplied for about 3,500,000 acres already irrigated, bringing to almost 5,000,000 acres the land which will have been rescued by the Federal Government supplying supplemental water. The Bureau of Reclamation estimates that as many as 20,000,000 acres additional can be irrigated with water resources as yet undeveloped and policies now in effect. The future growth and stabilization of conditions in the West will be correlated in large measure with the con-

servation of these remaining water resources and their beneficial use.

JOHN C. PAGE

**RECONSTRUCTION FINANCE CORPORATION (RFC).** The Reconstruction Finance Corporation, one of several agencies grouped under the Federal Loan Agency, may perform all its functions to Jan. 22, 1947, or such earlier date as the President may authorize. The Corporation was created by Act of Congress approved Jan. 22, 1932, to provide emergency financing facilities for financial institutions, to aid in financing agriculture, commerce, and industry, and for other purposes. Subsequent legislation extended its operations. The capital stock of the Corporation is \$500,000,000, fully subscribed and paid in by the Secretary of the Treasury and held for the benefit of the United States.

Public No. 664, approved June 25, 1940, authorized the Reconstruction Finance Corporation to aid the Government in its national defense program in the following manner:

"(1) To make loans to, or, when requested by the Federal Loan Administrator with the approval of the President, purchase the capital stock of, any corporation (a) for the purpose of producing, acquiring, and carrying strategic and critical materials as defined by the President, and (b) for plant construction, expansion and equipment, and working capital, to be used by the corporation in the manufacture of equipment and supplies necessary to the national defense, on such terms and conditions and with such maturities as the Corporation may determine, and

"(2) When requested by the Federal Loan Administrator, with the approval of the President, to create or to organize a corporation or corporations, with power (a) to produce, acquire, and carry strategic and critical materials as defined by the President, (b) to purchase and lease land, to purchase, lease, build, and expand plants, and to purchase and produce equipment, supplies, and machinery, for the manufacture of arms, ammunition, and implements of war, (c) to lease such plants to private corporations to engage in such manufacture, and (d) if the President finds that it is necessary for a Government agency to engage in such manufacture, to engage in such manufacture itself."

In aid of the defense program, under this and other authority, the RFC has made commitments aggregating approximately \$1,100,000,000. These include the creation on June 28, 1940, of the *Rubber Reserve Company* to acquire a reserve supply of raw rubber; \$5,000,000 was subscribed to the capital stock of this Company, and with the approval of the RFC it has agreed with the International Rubber Regulation Committee, which controls the world output of raw rubber, to purchase up to 430,000 tons of crude rubber, costing approximately \$190,000,000. Of this amount, 52,516 tons have been delivered, 20,139 tons are in transit, and 16,343 tons await shipment. In order not to interfere with the requirements of the rubber industry, the RFC is buying in co-operation with the industry at approximately 20¢ a lb. The industry agreed to carry not less than 150,000 tons to meet its current needs.

On June 28, 1940, the Corporation created the *Metals Reserve Company* with a capital of \$5,000,000 to acquire a reserve supply of critical and strategic materials. Purchases of such materials are in excess of current requirements. The Metals Reserve Company has made commitments to acquire supplies of antimony, chrome ore, copper, graphite, manganese ore, tungsten trioxide, tin, antimony, and wolframite at a total cost of \$376,724,200.

The *Defense Plant Corporation*, created Aug. 22, 1940, with a capital of \$5,000,000, has made commitments aggregating \$349,779,683. Of this amount \$283,206,197 is for the construction of plants

and the acquisition of machinery and equipment for the manufacture of airplanes and parts. These plants and equipment are owned by the Defense Plant Corporation and leased to the manufacturer. The Corporation is protected either by the rent received or by a contract of reimbursement from the Army or Navy Department. Of the total, \$35,550,000 is for machine tools, and the remainder for docks, shipyards, and the manufacture of tanks and tank engines, ordnance, and other items.

On Aug. 29, 1940, the *Defense Supplies Corporation* was created with a capital of \$5,000,000 to acquire and carry a reserve supply of critical and strategic materials and supplies which may be necessary in the national defense program. At the request of the National Defense Commission, it has allocated \$50,000,000 for the purchase of highest aviation gasoline. It has contracted for the purchase of 300,000 tons of nitrate of soda from Chile at a cost of \$5,400,000. It is transporting to and storing in this country 250,000,000 lb. of Australian wool. The estimated cost of the transportation and storage of the wool is \$12,000,000, to be provided by the President from the "Emergency Fund for the President" contained in the Military Appropriation Act, 1941. The wool belongs to Great Britain, but the United States government has the right to use any part of it that it may need.

On Oct. 23, 1940, the *Defense Homes Corporation* was incorporated with a capital of \$10,000,000, supplied by the President from the "Emergency Fund for the President" provided in the Naval and the Military Appropriation Acts of 1941. The Corporation assists in providing homes in localities where manufacturing is necessary in connection with facilities for the War and Navy Departments when private capital is not available, and where it is anticipated that the homes will be of permanent value to the community after the present emergency. Mortgages placed on these homes will be insured by Federal Housing Administration (q.v.) and if not purchased by private investors will be held by the Federal National Mortgage Association or The RFC Mortgage Company. The Defense Homes Corporation furnishes the equity in the projects.

In addition to the creation and capitalization of the foregoing corporations, and loans to them as outlined, the RFC has authorized 195 loans to 167 private manufacturers in the defense program, aggregating \$127,394,965. The RFC co-operates with banks in making loans for production, plant expansion, or other national defense purposes by taking participations in any such loans. Where the bank wishes to carry the entire loan, the Corporation gives a definite take-out agreement under the rates now in effect or as may be agreed upon. The Corporation has authorized participations to the extent of \$4,821,807 in defense loans aggregating \$6,786,894, practically all made by banks.

The construction of all defense plants and the acquisition of equipment are at the request of the War or Navy Departments, and the larger defense loans by the Corporation to manufacturers engaged on government contracts are made in co-operation with the Defense Commission. The purchase of defense supplies and critical and strategic materials is made at the request of, or in co-operation with, the Defense Commission. All of these subsidiaries of the RFC are managed and operated by directors, officers, and employees of the RFC under the supervision of the Federal Loan Administrator.

Through Dec. 31, 1940, total authorizations by

the Corporation and tentative commitments outstanding at the end of the month were \$12,199,428,377.01. Cancellations and withdrawals were \$2,713,075,098.94, and \$1,476,300,144.66 remains available to borrowers and to banks in the purchase of preferred stock, capital notes, or debentures, etc. Total disbursements were \$8,010,053,133.41, repayments and other credits \$6,181,589,851.66 (over 77 per cent.).

In addition to the foregoing loans and investments, the Corporation has allocated \$3,204,398,637.69 for relief and to other Governmental agencies by direction of Congress. Under an Act of Congress passed in February, 1938, the Secretary of the Treasury was directed to cancel notes of the Reconstruction Finance Corporation to the extent of funds outstanding in connection with allocation and relief disbursements; but no part of the notes canceled was for loans made to borrowers, or for investments made by the Corporation, and no debt due to the Government by any one was canceled. The total amount of notes canceled up to Dec. 31, 1940, was \$2,728,286,823.03.

After the payment of all expenses and interest on the money borrowed to lend, the Corporation has accumulated an operating surplus in excess of \$189,000,000, after providing a reserve of \$125,000,000 for losses and contingencies. The operating expenses of the Corporation have been substantially less than 1 per cent of the amount disbursed.

EMIL SCHRAM.

#### RECORDINGS. See PHOTOGRAPHY.

**RED CROSS, American National.** With the outbreak of European hostilities, the American Red Cross, working in association with sister societies throughout the world, inaugurated extensive war relief operations. On Oct. 31, 1940, relief totaled \$12,339,505. This was made possible through response of the public in oversubscribing a \$20,000,000 war relief appeal which began May 10. More than half of American Red Cross expenditures on European relief went to Great Britain, a total of \$7,261,489 as of October 31. An American Red Cross Committee was set up in London to administer assistance from this country to British relief agencies. American women, some 500,000 volunteers, were engaged during the year in the production of war relief garments and surgical dressings for use abroad. On October 31, the central warehouse at Jersey City, N.J., had received 14,588,505 surgical dressings and 1,786,260 articles of clothing for shipment. Grave needs arising in Finland's postwar period prompted the American Red Cross in October to begin shipment of \$1,000,000 worth of Government-purchased foodstuffs and chapter produced garments. Food, clothing, and medicines also moved to free and penetrated China for the relief of needy Chinese war victims. To assist the millions of Americans with family ties in the war zones, the Red Cross conducted an Inquiry Service, handling some 59,000 letters of inquiry up to November 15. More than 10,000 volunteers in the New York City area gave their blood for shipment to Great Britain for the treatment of war-wounded civilians and troops.

The American Red Cross had 3721 chapters with 6585 chapter branches in the United States and the insular possessions on June 30, 1940. In the 12 months preceding June 30, the American Red Cross conducted disaster relief operations at the scene of 102 catastrophes occurring in Continental United States. Assistance was given 102,000 persons at a cost of \$637,928. During the year 94,246 life sav-

ing certificates were issued, and 182,697 persons were qualified as beginners or swimmers under Red Cross supervision. Through the same period 379,860 first aid certificates—the largest number in the 30-year history of the program.

The problems of 140,357 disabled veterans or their families were dealt with by chapter workers. In hospitals and regional offices of the Veterans' Administration and in other Government hospitals, representatives of the national organization dealt with 58,505 ex-service men or their families. Chapters aided 12,155 men now in regular service, or their families. Red Cross field directors in Army, Navy, Coast Guard, and Marine Corps stations and workers in Government hospitals handled the cases of 53,365 men in active service or their families.

On the active list of the Red Cross Nurses' Reserve are 43,258 nurses ready to respond to calls from Army, Navy, and Red Cross disaster service. Public Health nurses made 1,038,363 nursing visits to or on behalf of patients; inspected 618,623 school children within the 12 months. At the close of the fiscal year 638 public health nurses were employed in 459 communities.

During the year 868 Red Cross chapters conducted 4440 courses in Home Hygiene and Care of the Sick, certifying 61,855 persons. Accomplishments of volunteers in special services included: Production of 462,857 pages of Braille transcribed by hand for blind readers, and 683,106 pages printed by duplicating process; 18,834 Christmas bags for distantly stationed men of the Army and Navy; the making of 66,379 calls by members of motor corps; the feeding of 80,599 persons by canteen workers. Membership for the year ended June 30, 1940, was 7,139,263 men and women—an increase of 1,470,583 over the previous year.

Increased responsibilities in connection with the national defense program greatly enlarged domestic operations of the Red Cross during the year. Machinery was set into motion for the induction of 4000 Red Cross nurses into the Army for active duty; at the request of the Surgeon General, the Red Cross began enrolling medical technologists for service when and if needed; in four key cities in the country, Red Cross volunteers gave their blood to enable specialists to perfect new methods of saline plasma transfusions for military use; metropolitan chapters began training Nurses' Aides as a part of the defense program; co-operating with Harvard University the Red Cross made plans for the erection of a 100-bed hospital in Great Britain in which 75 American doctors, Red Cross nurses and medical technicians will study wartime diseases under siege conditions, reporting findings to the Army, Navy, and U.S. Public Health Service.

The President of the United States is president of the American Red Cross. Norman H. Davis is chairman of the Central Committee, having been named by President Roosevelt on Apr. 12, 1938, to succeed the late Rear Admiral Cary T. Grayson. The Central Committee is composed of 18 members, six of whom are appointed by the President of the United States to represent the Government.

**REFORMED CHURCH.** A name used by three religious denominations in the United States. The Reformed Dutch Church in America, formerly the Reformed Dutch Church, was founded in New York in 1628 as a branch of the Reformed Church in Holland. Headquarters, 25 East 22 Street, New York, N.Y. The Christian Reformed Church was established in Michigan in 1857 by a group who withdrew from the former body. Headquarters,

Grand Rapids, Mich. For statistics, see **RELIGIOUS ORGANIZATIONS.**

**REFRESHER COURSES.** See **EDUCATION**; **EDUCATION, U.S. OFFICE OF**; **SOCIAL SECURITY BOARD.**

**REFUGEES.** The year 1940 encompassed the greatest refugee problem of all history, both in numbers of people involved and in intensity of suffering. Even the migrations following the first World War, which involved substantial numbers of Turks, Greeks and Bulgarians, Russians and Armenians, paled in comparison. These had been partially financed and directed by the League of Nations and, under bilateral treaties, relatively orderly exchanges of populations had taken place. The decade following the first World War saw a heavy infiltration into Western Europe of Russian and Armenian refugees. Although they suffered because of statelessness and the attendant political difficulties, many were able, in the prosperous era of the 1920s, to become absorbed. Nevertheless, as late as 1938, the League of Nations reported that almost 1,000,000 of these earlier refugees were still unsettled.

When 1940 opened, Europe held about 4,500,000 recent refugees—close to 4,000,000 Poles who had fled eastward and southward before the invading German armies in September, 1939; some 250,000 Spanish Loyalists in France; and about 140,000 German, Austrian, and Czech refugees in various western countries of asylum. Early in the year, the Russian conquest of Finland necessitated the resettling of 400,000 Finns from the areas ceded to Russia into the interior of Finland. The German invasion of Norway in April gave rise to a similar internal refugee problem, although of smaller dimensions.

The most panicky exodus of the year was that following the German conquest of the Low Countries, when 3,000,000 Dutch, Belgians, Luxemburgers, and Frenchmen clogged the roads of Southern France in their retreat from the Nazi advance. A refugee flow in the opposite direction took place a few weeks later after the collapse of France, when the great majority of these fleeing men, women, and children returned to their homes to assume the role of conquered peoples.

Most complicated of all was the lot of the refugees from Central Europe who had fled from Germany and the lands she successively swallowed in the period since 1933. These German, Austrian, and Czech refugees, the majority of them Jews, had been existing on sufferance in their countries of asylum. Forced out of their homelands by a series of legal and administrative decrees, they had crossed borders into contiguous lands where they were permitted to remain, for the most part, on the assumption that they would quickly re-emigrate to lands of permanent refuge overseas. Countries such as France, Holland, Belgium, Switzerland, despite humanitarian compassion, were unable to absorb large numbers of foreigners, predominantly urban dwellers.

Overseas countries accepted large numbers of refugees from 1933 onward. Approximately 130,000 entered the United States on immigration quotas. Over 110,000 found asylum in Latin America and the Philippines. Palestine absorbed about 90,000 refugees from Germany, Austria, and Czechoslovakia, in addition to about 150,000 Jewish emigrants from Poland, Rumania, and other East European countries. From 20,000–30,000 refugees went to such remote places as Australia and the Far East. These, taken together with the 140,000 refu-

gees who had remained on the European continent, completed the roster of the 500,000 persons who had fled from Greater Germany since the rise of National Socialism.

The difficulties encountered by the German refugees during 1940 were considerably aggravated by the outbreak of the war. Bottlenecks developed in overseas transportation facilities; the closing of the Mediterranean, when Italy entered the war in June, was a serious blow. A trans-Siberian route to the Pacific Ocean was developed, which was used by substantial numbers of refugees. Lisbon became the chief funnel for the westward refugee flow.

The more than 100,000 Polish refugees who had fled to the Baltic and Balkan countries when Poland was invaded, faced new threats during 1940 when Latvia, Lithuania, Estonia, and part of Rumania were absorbed by Soviet Russia, while Hungary and the rest of Rumania came increasingly under German domination. Large numbers of Poles, their number conservatively estimated at 300,000, were deported from Soviet-occupied Poland to Siberia during the latter part of the year. Smaller numbers voluntarily left Lithuania, Latvia, and Estonia for refuge in the Western Hemisphere.

The year was characterized by a number of cross-movements of populations. In the course of the German re-organization of Poland, Germans who had lived in the Baltics and the Balkans were repatriated to the western sections of Poland incorporated into Germany itself, while from the same area, Poles and Jews were driven eastward. During the fall more than 300,000 Germans were in process of repatriation from Bucovina, Bessarabia, and Rumania to Germany. Earlier in the year some 200,000 Austrians had been moved from the Italian Tyrol to new homes in Germany and Austria.

England, which began the year with some 65,000 refugees from Central Europe, after the invasion of the Low Countries sheltered numbers of Dutch and Belgian nationals as well as German, Austrian, and Czech refugees. These were all interned, and during the late summer many were removed to Canada, Australia, and New Zealand together with prisoners of war. A minor refugee movement, but one which aroused great sympathy, was that of 7000 British children who were sent to Canada, the United States, and Australia for the duration of the war. This plan was halted after several months because of the perils of overseas transportation.

The German policy of forced labor involved the transfer of several hundred thousand Czech, Danish, Norwegian, Dutch, and Belgian workers to the farms and war industries of the Reich. The refugee tide was further swelled with the expulsion of 10,000-20,000 Frenchmen from Lorraine into unoccupied France, and of several hundred Jews from Luxembourg. During the fall, the internment camps in unoccupied France were also made to house about 9000 Jews from the Baden and Palatinate areas of Germany.

The refugee problem received the attention of a number of intergovernmental and private agencies during the year. Relief work in France was conducted on an extensive scale by the American Red Cross, American Friends Service Committee, and the American Jewish Joint Distribution Committee. The latter organization likewise continued to bring help to distressed refugee and native Jewish populations in almost every country of Europe and to facilitate the emigration of large numbers. The Commission for Polish Relief was active through-

out the year. The Intergovernmental Committee on Refugees was unable, because of war conditions, to launch large-scale settlement projects. Hopeful progress was made, however, in the settlement of refugees in the Dominican Republic, a project which had been started early in the year with the co-operation of the Intergovernmental Committee. Other official bodies, such as the office of the League of Nations High Commissioner for Refugees and the International Labor Office, while unable to move forward in effective action, became increasingly aware of the enormity of the problem which would have to be faced when the war ended.

**RELIEF.** Relief and work relief, which had been for eight years the largest single object of Federal expenditure and had constituted a major congressional issue in 1939, faded somewhat from the public interest in 1940 as attention was focused on rearmament and employment began to rise. The roster of total recipients (including both public assistance under the Social Security Board and work-relief wages) started a downward trend in March and reached the low point of 15,232,000 in September. The slight rise occurring thereafter produced no figure comparable to the January total of 18,386,000. WPA rolls followed unemployment downward from about 2,300,000 in March to only 1,900,000 in December. The Treasury Department reported that allocations (warrants issued) under the Emergency Relief Appropriation Act for the fiscal year 1941 totaled only \$1,071,729,157, as compared with \$1,795,478,539 under the Act of 1939 and \$2,529,649,668 under the Act of 1938. Expenditures (checks issued) for the first half of the 1941 fiscal year (to Dec. 31, 1940) were \$727,015,239, considerably less than half of the totals for the fiscal years 1940 (\$1,835,290,498) and 1939 (\$2,617,974,767).

In the year's national elections, likewise, the relief issue failed to play so prominent a part as it might have in any of several preceding years. The Republican platform reiterated the contention that administration of aid to the needy should be placed under State rather than Federal control, and held out the hope of ultimately reducing the need for high expenditures by measures to improve economic conditions. However, it favored the raising of old-age benefits as far as revenues would permit and guaranteed continued aid to farmers, including continued cash benefits. The Democrats alleged that the placing of relief administration in the hands of the States would be virtually a return to the dole. They promised the farmers continued parity (as well as conservation) payments, and additional funds for tenant purchase and refinancing of mortgages. Obviously, neither party felt itself in a position to risk its popularity with the voters by taking a stand against the preponderance of

<sup>3</sup> Less than 500 persons.

relief expenditures in the Nation's unbalanced budget.

There was a more noticeable tendency in general to accept the relief rolls as a permanent rather than an emergency burden and to undertake improvement of the set-up under which they were to be conducted. Several States made improvements in their laws or administration. (See the articles on the States, notably CALIFORNIA, NEW JERSEY, NEW YORK, and PENNSYLVANIA.) A special committee of the House of Representatives, investigating the interstate migration of destitute citizens, conducted hearings during the 76th Congress. Privately initiated was a grant made by the Falk Foundation for study of the relief problem.

A respect in which the present system is noticeably unsatisfactory is the variation in assistance provided in various States under the public assistance program (where the Federal Government matches State grants) and as general relief (which is entirely financed from State and local funds). For example, in November, 1940, general relief payments per case ranged from \$2.99 monthly in Mississippi to \$37.15 in New York; old-age payments were \$7.92 monthly in South Carolina per recipient, and \$37.88 in California. A series of articles in the *Social Security Bulletin* during 1940 by Daniel S. Gerig, Jr., raised the question as to whether a formula can be constructed for allocating Federal grants-in-aid among the States in such a way as to secure adequate welfare services in all States. He pointed out that the discrepancies now existing are due to the varying financial resources of each State; for example, per capita income varied from \$207 to \$923, mean taxable wage per employee from \$413 to \$1102, in the poorest and wealthiest States. One solution suggested was the adoption of variable-ratio grants, in which the Federal grants-in-aid to the States would be based on the per capita income of each State. Such a policy, according to Gerig, would not raise total Federal payments and would be relatively stable from year to year.

The Emergency Relief Act of 1940 appropriated \$1,157,711,357 for expenditure in the fiscal year 1940; \$975,650,000 was for the WPA and might be expended within eight months. The Act authorized \$50,000,000 for relief of European refugees, and authorized the President to require disciplinary training of CCC workers in non-combatant trades and skills useful to the Army in an emergency. An effort to repeal the provision that WPA workers must be removed from the rolls after 18 months was defeated after considerable debate.

The tables on page 653, reprinted from the *Social Security Bulletin*, show the number of recipients and the amounts paid under the public assistance program and the Federal works programs of the United States. The reader is referred to the separate articles on all the government agencies there listed, on the SOCIAL SECURITY BOARD, and on the various Federal lending agencies. For special discussion of farm aid, see AGRICULTURE. For non-government activities in the field of public welfare, see BENEFACTIONS and the articles there listed, especially WAR RELIEF.

**RELIGIOUS BOOKS.** See LITERATURE, ENGLISH AND AMERICAN.

**RELIGIOUS ORGANIZATIONS.** The table on pages 655 and 656 presents statistics released during 1940 for the decennial census of religious bodies in the United States. Churches having fewer than 5000 members have not been given a separate listing. However, the group totals, as "Methodist

bodies," include all denominations in the connection, regardless of membership. For more recent statistics on the larger churches, the reader is referred to separate articles in this volume.

The U.S. Bureau of the Census summarized the results of this census in part as follows:

According to the returns received, there were in continental United States in 1936, 256 Religious Bodies with 199,302 organizations and 55,807,366 members, as compared with 213 denominations reporting 232,154 organizations and 54,576,346 members in 1926. . . . As the term "members," has a variety of uses, each church was requested to report the number of members according to the definition of membership in that church or organization. . . .

At the census of 1936 the total expenditures were \$518,953,571, as compared with \$817,214,528 in 1926. Under this item are included the amount expended for salaries, repairs, etc.; for payments on church debt; for benevolences, including home and foreign missions; for denominational support, and for all other purposes.

The value of church edifices in 1936 was \$3,411,875,467, as compared with \$3,839,500,610 in 1926. This item includes any building used mainly for religious services, together with the land on which it stands and all furniture and furnishings owned by the church and actually used in connection with church services. It does not include buildings hired for religious services or those used for social or organization work in connection with the church.

**RENTS.** See BUILDING; HOUSING AUTHORITY, U.S.; LIVING COSTS AND STANDARDS

**REPARATIONS AND WAR DEBTS.**

War debts payments in default to the U.S. Government and the new installments due June 15 and Dec. 15, 1940, follow:

Country	Previously due and unpaid	Due June 15	Due Dec 15
Belgium	\$89,269,900	\$9,442,454	\$4,642,454
Czechoslovakia	23,046,652	1,682,813	1,682,813
Estonia	5,728,689	322,850	468,850
Finland		159,398	235,398
France	687,197,254	102,372,111	41,569,745
Great Britain	1,411,169,427	85,670,765	127,670,765
Hungary	597,371	37,411	52,771
Italy	122,486,131	17,941,593	3,387,031
Latvia	2,261,261	134,883	194,883
Lithuania	1,936,495	172,802	121,467
Poland	71,134,306	4,039,040	5,696,040
Rumania	12,741,311	1,386,870	956,310
Yugoslavia	2,917,578	526,516	154,062
Total	2,430,486,376	223,889,505	186,834,589

Payer	Paid June 15	Paid Dec 15
Finland	\$159,398	
Hungary	9,828	\$9,828
Rumania	100,000	
Total	269,226	9,828

The German Government on Sept. 30, 1940, defaulted on an installment of 43,147,737 reichsmarks due the U.S. Government. This brought the total German defaults since Sept. 30, 1933, to 676,127,241 reichsmarks (reichsmark = \$0.4033 at par).

\* With all figures in this column read "for churches reporting." Not all the churches enumerated in the first column gave a report in this category.

\* The Methodist Episcopal Church, the Methodist Episcopal Church South, and the Methodist Protestant Church were united in 1939 as the Methodist Church (q.v.)

\* For the word "church" read "corps."

\* For the word "church" read "station."

**RÉUNION.** An insular colony of France, 420 miles east of Madagascar. Area, 970 square miles; population (1938), 210,000. Chief towns: St. Denis (the capital), 30,762 inhabitants in 1936; St. Paul; St. Louis; St. Pierre. Chief products: sugar, rum, manioc, coffee, tapioca, vanilla, and spices. Trade (1938): imports, 263,900,000 francs; exports, 206,400,000 francs (franc averaged \$0.0288 for 1938; \$0.0251, 1939). Budget (1937): balanced at 61,620,700 francs (franc averaged \$0.0405 for 1937). Governor, M. Truitart. Réunion adhered to the Vichy Government after the collapse of the French Republic in 1940. See FRANCE under *History*.

**REVENUES.** See CUSTOMS, BUREAU OF; PUBLIC FINANCE; TAXATION; and the articles on foreign countries under *Finance*.

**REYNOLDS FOUNDATION.** See BENEFRACTIONS.

**RFC.** See RECONSTRUCTION FINANCE CORPORATION

**RHODE ISLAND.** Area, 1248 square miles; includes water, 181 square miles. Population (U.S. Census), April, 1940, 713,346; 1930, 687,497. Providence, the capital (1940), 253,504. The urban population (inhabitants of places of 2500 or over) numbered 653,383 in 1940, having since 1930 gained 17,954, or 2.8 per cent; while the small rural population, 59,963 in 1940, had gained 7895, or 15.2 per cent—more than five times the urban rate of gain.

**Agriculture.** Rhode Island harvested, in 1940, 60,500 acres of the principal crops. On nearly three-fourths of this area, tame hay, occupying 44,000 acres, produced 56,000 tons (\$974,000 in estimated value to the growers); potatoes, 4500 acres, gave 878,000 bu. (\$667,000); corn, 9000 acres, 369,000 bu. (\$284,000); apples for market, 267,000 bu. (\$280,000). Farms numbered 3014 in 1940 and averaged 73.6 acres.

**Manufactures.** Rhode Island's production of manufactured goods amounted to \$516,390,541 for 1939; \$517,196,193 for 1937. Other related totals for 1939 (each with 1937's in parentheses) · 1460 (1409) establishments, paying to 106,275 (108,031) persons \$105,406,950 (\$112,933,084) in year's wages, expended \$278,301,981 (\$276,738,611) for materials, contract work, etc., and added to materials by manufacture \$238,088,560 (\$240,457,582).

**Education.** For the academic year 1939-40, inhabitants of school age (from 4 years to 20) were reckoned at 194,013. Enrollments of pupils in all public schools numbered 114,198; this comprised 65,841 in elementary study, 24,443 in junior high schools, and 23,914 in high schools. Private and parochial schools had 34,060 enrollments. The year's expenditure for public-school education totaled \$10,716,795. Public school teachers, 4229, averaged \$1653 in year's salary.

**History.** The legislature held a regular annual session, ended on April 24. Although under the control of Republican leaders the session gave no great support to the proposals of Governor Vanderbilt; it passed a measure, on his recommendation, allowing \$50,000 for the investigation of frauds in voting; but it passed legislation contrary to his wish to make all State employees pass examinations before admittance into the new civil-service system, and it removed the State's tax of 10 per cent on tobacco from all but cigarettes. Providence was authorized to hold a referendum election on whether to adopt a nonpartisan system of local government. Restaurants and dancing-places deriving 70 per cent or more of their receipts from sales of intoxicants lost the right to a

kind of license that had allowed them to operate on Sundays and holidays.

Governor Vanderbilt ran into difficulties early in the year on account of his admittedly having hired agents to run down, by wiretapping, cases of possible official corruption. Among those declaring that they had been subjected to this kind of espionage were Mayor Thomas P. McCoy of Providence and Attorney General Jackvony, a Republican. Vanderbilt, accused of wiretapping by State Senator McCoy, the Mayor's brother, early in January, later admitted that he had used this way of hunting evidence as to fraud in the State election of 1938; he defended his course as proper for his purpose. Recent revelations elsewhere had nevertheless given mechanical espionage a bad name, and Vanderbilt's wiretapping underwent a public airing in May before a committee of the U.S. Senate.

**Elections.** At the general election (November 5) the popular vote for President totaled 181,122 for Roosevelt (Dem.) and 138,214 for Willkie (Rep.). Peter G. Gerry (Dem.) was re-elected U.S. Senator, defeating Lieutenant Governor James O. McManus (Rep.). J. Howard McGrath (Dem.) was elected Governor, defeating Governor William H. Vanderbilt (Rep.).

**Officers.** Rhode Island's chief officers, serving in 1940, were: Governor, William H. Vanderbilt (Rep.); Lieutenant Governor, James O. McManus; Secretary of State, J. Hector Paquin; Attorney General, Louis V. Jackvony; General Treasurer, Thomas P. Hazard; Comptroller, Samuel A. Place; Director of the Department of Education, James F. Rockett.

**RHODES.** See AEGEAN ISLANDS, ITALIAN.

**RHODESIA, Northern.** A British protectorate in Africa. Area, 290,320 square miles; population (1938), 1,379,962, including 1,366,425 Africans, 13,000 Europeans, and 537 Asiatics. Chief towns: Lusaka (capital), Livingstone, Broken Hill, Fort Jameson, Mazabuka. Education (1938): 122,065 students enrolled in schools of all kinds.

**Production and Trade.** Chief agricultural products: maize, wheat, tobacco, coffee, oilseeds, citrus fruits, teakwood. Mineral output (1939) was valued at £11,511,370, including copper (211,668 tons), cobalt alloy (3830 tons), zinc (12,695 tons), silver (61,183 fine oz.), gold (4643 fine oz.). Trade (1939): imports, £4,512,000; exports, £10,176,000.

**Government.** Budget (1940): revenue, £1,900,786; expenditure, £1,598,530. Northern Rhodesia is administered by a governor, assisted by an executive council. There is a legislative council of 17 members, including the governor as president. Governor, Sir John Maybin (appointed Jan. 27, 1938).

**History.** Northern Rhodesia made an important contribution to the British Empire's war effort during 1940. In January the 1st Battalion of the Northern Rhodesia Regiment and the Northern Rhodesia Army Service Corps arrived in Kenya. When Italy entered the war in June, they participated in the campaign along the Kenya-Italian East Africa frontier (see EUROPEAN WAR under *Campaigns in Africa*). Conscription of all male British subjects in Northern Rhodesia between 18 and 45 years of age was introduced June 12, and additional troops were sent to aid the British forces in East and North Africa.

The Northern Rhodesian copper mines continued to supply Great Britain with this vital war metal. The contract entered into by the British Government in 1939 to purchase 265,000 short tons of copper was renewed in 1940 for the same amount

at the same prices. A strike of skilled European workers in the Mufulira and Nkana mines in March threatened to curtail production. Most of their demands were granted and they returned to work on March 27. About 15,000 of the 26,000 native workers in the copper mines meanwhile struck for higher pay. On April 3, while non-strikers at the Nkana mine were drawing their pay, the mine compound was attacked by about 3000 strikers. After 31 policemen and soldiers guarding the mine had been injured by rocks and other missiles, the troops fired on the strikers, killing 13 and wounding 71, of whom 4 died. Shortly afterwards the strikers returned to work at the increased pay offered them before the strike began.

A commission of inquiry headed by Sir John Forster investigated the clash. Later the government ordered compulsory arbitration of industrial disputes that could not be adjusted by conciliation procedures. The Chief Justice of Northern Rhodesia was named chairman of the permanent arbitration tribunal.

**RHODESIA, Southern.** A British self-governing colony in Africa. Area, 150,333 square miles; population (1939), 1,385,560, including 1,319,000 natives, and 60,720 Europeans. Chief towns: Salisbury, the capital (32,846 inhabitants in 1936), Bulawayo (29,126), Umtali, Gwelo, Gatooma, Que Que, Eiffel Flats, Shabani. Education (1938): 121,219 pupils enrolled in schools of all kinds.

**Production and Trade.** Chief agricultural products: maize, wheat, cotton, tobacco, groundnuts, fruits, and dairy products. Livestock (1938): 2,295,675 cattle, 310,537 sheep, 121,777 swine. Mineral production (1939) was valued at £8,137,682, including gold (795,613 fine oz.) £6,227,282, asbestos (58,313 short tons) £1,088,782, chrome ore (153,313 short tons) £186,577, tin concentrates (721 short tons) £86,188, tungsten (274 short tons) £40,296, nickel ore (2696 short tons) £26,431, silver, iron, etc. Trade (1939): imports, £9,054,359; exports, £10,168,152.

**Communications.** A total of 1356 route miles of railway was in operation in the colony during 1938 and this was supplemented by a road motor service which aggregated 1588 route miles. There is an airways network which links the important towns and includes a service to Beira, Mozambique, the whole system totaled 2769 route miles in 1940.

**Government.** Finance (1938-39): revenue, £3,320,000; expenditure, £4,865,471; public debt, £12,367,224. The government is administered by a governor, aided by an executive council. There is a legislature which consists of a legislative assembly of 30 members elected for a five-year term by popular franchise. At the election held on Apr. 14, 1939, the standing of the political parties was: United Party 23, Labor Party 7. Governor, Sir H. J. Stanley (appointed in 1934); Premier, G. M. Huggins (United Party).

**History.** Southern Rhodesia was organized for full military and economic participation in the British Empire's war effort during 1940. In April the first contingent of Southern Rhodesian troops joined the British forces in Egypt. It included artillery, engineer, signal corps, armored car, infantry, and machine-gun units. A part of this force was sent on to England. When the Legislative Assembly convened in Salisbury late in April, the Governor announced that a compulsory non-military service system would be combined with the existing voluntary military recruiting system in order to maintain essential economic activities.

The Legislative Assembly not only approved a contribution of £1,500,000 to the Empire's war chest but established an expanded air-training system comprising seven training centers and designed to attract student pilots and other personnel from various parts of the Empire. A contingent of Rhodesian airmen arrived in Britain in August for service with the R.A.F. All-Rhodesian bomber and fighter squadrons were established in England. Others served with the British forces in North Africa. See **EUROPEAN WAR** under *Campaigns in Africa*.

To finance its military and other war activities, Southern Rhodesia on June 28 imposed higher income and excess profits taxes. Supplementary budget appropriations of £1,178,336 were requested October 24 to cover ordinary and war expenditures for 1940-41. This brought the total expenditure for the year to £8,500,000, of which £2,750,000 was to be met from loans. Early in 1940 the Bank of England, acting for the British Treasury, arranged for the direct purchase of Rhodesian gold for the duration of the war. On March 1 the colony's first national currency notes were issued; they were gradually to replace the existing currency, consisting of notes of the Standard Bank of South Africa and Barclays Bank. The 50th anniversary of the hoisting of the British flag over Rhodesia was celebrated on September 12.

See **SOUTH AFRICA** under *History*.

**RICE.** The rice crop in the United States in 1940 was estimated by the U.S. Department of Agriculture to total 52,754,000 bu. from 1,051,000 acres versus 53,722,000 bu. in 1939 from 1,040,000 acres, and compared with the 1929-38 average of 44,254,000 bu. and 924,000 acres. The smaller production, despite the increased acreage, was due largely to lower production in Louisiana caused by the August, 1940, storm. Acre yields averaged 50.2 bu. in 1940, 51.7 bu. in 1939, and 47.9 bu. over the 10-year period. Yields in producing states were: For Louisiana 18,040,000 bu., Texas 16,005,000, Arkansas 9,741,000, and California 8,968,000 bu. The season average price per bu. (preliminary) received by farmers was 70.2 cents and the value of production was estimated at \$37,052,000 compared to 72.8 cents and \$39,095,000 in 1939.

The 1940-41 crop of rough rice in other countries was for China 2,440,000,000 bu., Japan 549,968,000, Burma 405,490,000, Korea (Chosen) 192,766,000, Formosa (Taiwan) 84,894,000, Manchuria 34,588,000, Italy 41,185,000, Spain 11,758,000, and Mexico 4,409,000 bu. The 1939-40 crop of Thailand (Siam) was 225,152,000 bu., Philippine Islands 116,000,000, British India, 1,887,711,000, Egypt 43,493,000, Argentina 4,752,000, Chile 2,595,000, and Uruguay 1,088,000 bu. Total world production in 1940-41 was estimated at 6,888,000,000 bu. versus 7,106,000,000 bu. in 1939-40. See *Production* under individual countries.

**RIOM TRIALS.** See **FRANCE** under *History*.

**RIOUW-LINGGA.** See **NETHERLANDS** under *Area and Population*.

**RIVERS.** See **ENGINEERS**, **CORPS OF**; **FLOOD CONTROL**; **MISSOURI**; **WATERWAYS**, **INLAND**.

**ROADS AND STREETS.** Federal-State cooperation in highway construction during the fiscal year ending June 30, resulted in the completion of 11,397 miles of roads, elimination of 414 railroad-highway grade crossings, protection of 1201 crossings, and reconstruction of 87 obsolete grade separation structures. Of the \$296,932,000 cost the Federal Government provided \$172,952,000. Improvements were made to 7612 miles of the Fed-

eral-aid highway system in rural areas, 3281 miles of secondary roads, and 504 miles of city streets. Work approved or under construction on June 30 included 13,884 miles of highway, 412 crossing eliminations, 96 grade crossing reconstructions, and 741 crossing protection projects, all at an estimated cost of \$394,000,000.

New York City's 33-mile Belt Parkway (Brooklyn borough) was opened to traffic June 29. It extends from Owl's Head Park in Brooklyn to the Bronx-Whitestone Bridge in northern Queens where it connects with existing parkways in the Bronx. The Brooklyn-Battery Tunnel, put under construction late in the year, will connect the Belt Parkway with the West Side Express Highway along the Hudson River in Manhattan, an important part of which is in use. The East River Express Highway in Manhattan extends from the Battery at the south end of the island northward to the Triborough Bridge at 125th St., a distance of nine miles. The proposed Harlem River Drive will complete a belt line encircling Manhattan. Completion late in the year of the Midtown Tunnel gave vehicular connection between Manhattan and Queens boroughs, as had already been provided from Manhattan beneath the Hudson to New Jersey by the Holland and Lincoln tunnels. (For maps and other details of these projects, see *Engineering News-Record*, March 21, May 9, July 11, and Nov. 31, 1940.)

The Pennsylvania Turnpike, a 161-mile express toll-road between the outskirts of Harrisburg and Pittsburgh, was opened September 30. It is a four-lane highway, by-passing all towns and without highway or railroad crossings at grades. It was built by the Pennsylvania Turnpike Commission which will operate it until its cost is met by tolls and by revenue from the ten privately-owned service stations along the road, after which the road will become a part of the state highway system.

In Florida the New Everglades Highway is under construction from South Bay to roads entering Miami and Fort Lauderdale, 69 miles. In building this road across marsh land, floating drag-line excavators are used and drillboats for blasting the rock underlying the muck. The trench thus excavated is filled with rock rolled in layers. On this the roadbed, also of stone, finished with a tar primer, is built. (For map, construction methods, and equipment, see *Engineering News-Record*, Aug. 29, 1940.)

In Canada 73 of the 91 miles of the Queen Elizabeth Way, between Toronto and Niagara Falls, was put in service on August 29. It was built by the Ontario Department of Highways.

**World Highways.** The annual survey of highways of the world, brought as nearly as possible to the close of 1940 by the U.S. Bureau of Foreign and Domestic Commerce, shows 9,910,578 miles of road, an average of 5.1 square miles to each mile of road, and 45,459,557 "automobiles." Figures for the leading countries are given in the accompanying table.

See AUTOMOBILES; BRIDGES; ELECTRICAL ILLUMINATION; NATIONAL PARK SERVICE; RAPID TRANSIT; TUNNELS; CONNECTICUT, GEORGIA, and PENNSYLVANIA under *History*; countries under *Transportation*.

**ROANOKE COLONY.** See NORTH CAROLINA under *History*.

**ROCKEFELLER FOUNDATION, The.** An organization chartered in 1913 for the permanent purpose of promoting the well-being of mankind throughout the world. Its program is concerned with certain definite problems in the fields of the medical, natural, and social sciences, the humanities, and public health. For work in these fields the Foundation during 1940 appropriated approximately \$9,800,000. A statement of the major grants follows.

**Medical Sciences.** In the field of medicine the Foundation's interest is centered on mental and nervous diseases and its contributions are largely for the furtherance of research and teaching in psychiatry and allied subjects. Appropriations made in 1940 for the various projects were \$21,000 to Leland Stanford Junior University School of Medicine for researches in kidney diseases; \$23,000 to Johns Hopkins University for continuing support to subdepartment of neurology; \$175,000 to Duke University for establishment and development of a division of psychiatry and mental hygiene in the school of medicine; \$57,000 to Harvard Medical School for research in epilepsy; \$106,000 to Harvard Medical School and Massachusetts General Hospital for teaching and research in psychiatry; \$30,000 to Harvard University for research in industrial hazards; \$25,000 to Tufts College for research in neurology; \$30,000 to Tufts College Medical School for research in brain chemistry; \$42,000 to Columbia University for researches in endocrinology in the department of anatomy; \$18,250 to the University of Edinburgh for research in psychiatry, neurology, and neurosurgery; \$14,000 to the University of Brussels for teaching and research in social medicine; \$10,000 to West China Union University for the public health practice field to be administered by the universities' public health council; \$37,000 to Worcester State Hospital for research on dementia praecox; \$10,800 to University of Manitoba for teaching of preventive medicine; \$12,500 to American Psychiatric Association for expenses of teaching conferences for professional personnel of state mental hospitals; \$70,000 to National Research Council for fellowships in the medical sciences; \$9000 to Yale University School of Medicine for teaching of public health and preventive medicine.

**Natural Sciences.** The Foundation's work in the natural sciences is centered almost entirely on experimental biology and appropriations during 1940 were made to further projects in this branch. They included: \$1,150,000 to the University of California for the construction, housing, and installation of a giant cyclotron; \$24,000 to the State University of Iowa for research in cellular biology; \$20,000 to Indiana University for research in cytogenetics; \$55,000 to the University of Chicago for research in spectroscopic biology; \$110,400 to the Marine Biological Laboratory, Woods Hole, for the construction and furnishing of an addition to the library; \$200,000 to the Massachusetts Institute of Technology, for the development of biological engineering; \$40,000 to Princeton University for research in organic chemistry; \$28,000 to the Catholic University of America for research

on the decomposition and synthesis of certain polynuclear ring systems; \$15,000 to the University of Texas for research on growth-promoting substances; \$22,500 to the University of Wisconsin for research in the biochemistry of symbiotic nitrogen fixation; \$57,000 to the California Institute of Technology for research in serological genetics and for the development of chemistry in its relation to biological problems; \$17,000 to Cornell University for research in molecular structure; \$13,500 to Roscoe B. Jackson Memorial Laboratory for special research in genetics; \$11,800 to Columbia University for research on the biochemistry and genetics of cystinuria in dogs; \$11,250 to the University of Uppsala for research on the physical-chemical properties of proteins and other substances; \$11,000 to McGill University for research in cytology and genetics; \$21,000 to Iowa State College for research in genetics; \$20,000 to the American Institute of Physics for its publication program; and \$15,000 to the National Research Council for the establishment of a revolving fund for the publication of mathematical tables and aids to computation and bibliography of such tables.

**Social Sciences.** In the field of the social sciences, the Foundation's interest at the present time is in the spheres of social security, public administration, and international relations. The appropriations made during 1940 were as follows: \$105,000 to the University of Pennsylvania toward support of the Industrial Research Department of the Wharton School; \$105,000 to the Institute for Advanced Studies at Princeton toward support of its work in economics; \$15,000 to the Social Science Research Council for use by its Committee on Social Security, and \$15,000 for use by its Public Administration Committee; \$7500 to the Pacific Northwest Council of Education, Planning, and Public Administration for research and publication; to the University of Minnesota, \$39,000 for its public service training program and \$11,500 for a study of employment and unemployment in St. Paul; \$60,000 to Leland Stanford Junior University toward support of the research program of the Food Research Institute; \$10,000 to the New School for Social Research for its Graduate Faculty of Political and Social Science; \$10,000 to the Bureau of Business Research of the University of Alabama for a study of commodity production in the Southeast; \$20,000 to the National Bureau of Economic Research for research in fiscal policy; \$24,000 to the University of Oxford for its Social Studies Research Committee for a continuation of previous activities and new war-time research program; \$105,000 to the National Institute of Public Affairs for experimentation in recruiting and training personnel for the Federal Services.

**The Humanities.** The program in the humanities is concerned with the techniques, such as museums, motion pictures, radio, drama, and libraries by which cultural levels of contemporary society are being influenced, and with the promotion of better international understanding through cultural interchanges. Appropriations in 1940 included \$50,000 to the Folger Shakespeare Library toward the purchase and cataloguing of books and manuscripts; \$20,160 to the New School for Social Research for experimental demonstrations of music in film production; \$35,400 to Columbia University for studies in radio listening; \$34,000 to Cornell University for a state-wide program in music and drama and for the development of Russian studies; \$18,500 to the Rocky Mountain Radio Council toward expenses; \$25,000 to Leland Stanford Junior

University for work in drama; \$60,000 to the Museum of Modern Art for general support of the Film Library; \$19,500 to Yale University for expenses of developing and testing equipment in theater lighting; \$25,000 to Duke University for the purchase of books and other documentation in the field of Latin-American studies; \$18,000 to Tulane University for the purchase of Latin-American books; \$25,000 to the University of North Carolina for the purchase of Latin-American books; \$20,000 to the Payne Fund for expenses of preparing materials for the teaching of English to foreign-born residents of the United States; \$25,000 to the American Library in Paris, Inc., for general expenses of operation; \$25,000 to Princeton University toward work of the Listening Center of its School of Public and International Affairs; \$52,000 to the American Council of Learned Societies for support of activities of the Committee on Latin-American Studies and for general expenses of the Council; \$35,000 to Brown University toward collections of material on early American history and Hispanic culture; and \$15,000 to the Argentine-North American Cultural Institute of Buenos Aires for development of its program of teaching English, drama, and the creative arts.

**Public Health.** The Foundation appropriated \$2,000,000 for the work of its International Health Division during 1940. This work included research on a number of selected diseases, among them yellow fever, malaria, tuberculosis, influenza, the common cold, rabies, syphilis, and intestinal parasitism; demonstrations in the control of certain of these diseases in their environment, co-operation with governments in the organization or improvement of important services of central or local health departments; and the development of public health education. Fellowships in public health were provided and public health personnel were given opportunities for training in connection with the health demonstrations and through travel.

**Officers.** The executive officers of the Foundation in 1940 were Walter W. Stewart, chairman of the board of trustees; Raymond B. Fosdick, president; Thomas B. Appleget and Selskar M. Gunn, vice-presidents; Alan Gregg, M.D., director for the medical sciences; Warren Weaver, director for the natural sciences; Joseph H. Willits, director for the social sciences; David H. Stevens, director for the humanities; Wilbur A. Sawyer, M.D., director of the International Health Division; Norma S. Thompson, secretary; Edward Robinson, treasurer; George J. Beal, comptroller; Thomas M. Debevoise, counsel; and Chauncey Belknap, associate counsel. The offices of the Foundation are located at 49 West 49th Street, New York City. See **LIBRARY PROGRESS**.

**ROMAN CATHOLIC CHURCH.** The spread of the war, with Italy an active participant, cast a pall over Vatican City, curtailed many of its public activities in 1940, and stemmed news emanating from that source. *Osservatore Romano*, the official newspaper of the Vatican, published in Rome itself, came under censor control and, in the first half of 1940 the only source for many Italians of world news, was allowed to report only religious events. No public consistories were held, although normally the appointment of Cardinals would have been announced. On Candlemas Day, receiving representatives of the 174 ecclesiastical bodies in Rome, Pope Pius XII enumerated the five duties of a parish priest, saying he must be an apostle, a pastor and father to the people, a mediator between God and man, a preacher, and a good shepherd re-

lieving corporal needs. To students of the North American College in May, he spoke of the fruits the sacerdotal ministry is called to produce. Because of the war this college was later closed, for the first time since its foundation in 1859. Attending the Requiem Mass in St. Peter's on the first anniversary of the death of Pius XI, the Pope recalled the great efforts for peace of his predecessor and re-emphasized his own desire for the pacification of the world. On the occasion of an audience accorded members of the Spanish Naval Mission, the Holy Father praised the Spanish people for their heroic defense of their "Catholic faith from the very grave danger that threatened it."

A secret consistory was held March 7 for the purpose of naming new bishops. Peace was the subject of the Pope's discourse on Easter Sunday, at which time he bestowed his blessing on the assembly in St. Peter's Square and on other millions listening by radio. Asking that Catholics throughout the world, and particularly the children, pray for peace during May, he wrote: "We desire . . . that all should interweave their prayers with Ours that the merciful God, by His powerful command, may hasten the end of this calamitous storm." Solemn festivities in honor of St. Francis of Assisi and St. Catherine of Siena, chief patrons of Italy, were brought to a close May 5 with a pontifical Mass in Santa Maria sopra Minerva, the Pontiff's titular church. On arriving there he was received with military honors by Italian troops. During the months of May and June the following canonizations and beatifications took place with impressive ceremonies: May 2, the canonization of Bl. Mary of St. Euphrasia Pelletier, foundress of the Sisters of the Good Shepherd, and Bl. Gemma Galgani, Passionist tertiary of Lucca; May 12, beatification of Ven. Rose Phillipine Duchesne, who introduced the Religious of the Sacred Heart into America; May 19, beatification of Ven. Gioacchina de Vedruna de Mas, of Spain, foundress of the Institute of the Carmelites of Charity; May 26, beatification of Ven. Mary of the Crucified di Rosa, foundress of the Congregation of the Handmaids of Charity; July 2, beatification of Ven. Maria Wilhelmina Emily de Rodat, foundress of the Sisters of the Holy Family; June 9, beatification of Ven. Ignatius of Laconi, lay Capuchin.

On May 7, a Concordat with Portugal, an agreement relating to missions in Portuguese colonies, was signed at the Vatican, and Antonio Pacheco, newly appointed Ambassador from Portugal, presented his credentials. The new Ambassador of Italy to the Holy See, Bernard Attilico, was received on May 29; Wladimir d'Ormesson, the new Ambassador of France, on June 9; and Gen. Carlos Quintanilla, the new Ambassador of Bolivia, on August 11. In commemoration of the 4th centenary of the Society of Jesus, Pius XII addressed a letter to the Society's superior general, Very Rev. Vladimir Ledochowski, praising the notable achievements of the Jesuits in the service of the Church and the Holy See, their great scholars, educators, missionaries, and saints. Because of the war, the celebration of this centenary was postponed.

The Pontiff on October 13, addressed by radio the closing session of the 3d National Eucharistic Congress of Argentina, in Santa Fé, calling upon the pilgrims to pray earnestly for peace among all mankind. On October 27, he delivered a discourse by radio to the National Eucharistic Congress held in Peru. In a special Mission Sunday broadcast, October 19, he appealed to the Catholics in the

United States for aid to the missions and said their "large-souled liberality" gives honor to their name "in the harvest fields of the Gospel and among the tillers of Christ." On November 15, he received the credentials of Rumania's new Ambassador to the Holy See, Basil Grigorcea. A Motu Proprio designated November 24 as a "day of public prayer that all those who had died as a result of the war might obtain eternal rest, that all those who suffered or mourned as a result of the war might be comforted, and that true peace might be restored in justice and all peoples united as brothers." In another Motu Proprio issued in December he expressed the hope that the warring nations would declare a truce at Christmas and gave permission for the celebration of Mass in the afternoon of Christmas Eve in those countries where blackouts are in force, thus "overlooking nothing that can bring at least spiritual comfort to those who are bearing sorrows and distress of all kinds because of war."

During the year preparations to meet war conditions were quietly made at the Vatican which, like all Rome, observed the blackout. Special bomb-proof shelters were constructed for the Pope and the inhabitants of Vatican City, and special protection from explosives was given many of the buildings. As always, the Vatican witnessed intense diplomatic activities but obviously little information of these were given publicly. The diplomatic corps at the Vatican during 1940 was composed of representatives from Argentina, Belgium, Bolivia, Brazil, Chile, Colombia, Costa Rica, Cuba, Ecuador, France, Germany, Great Britain, Guatemala, Haiti, Honduras, Hungary, Ireland, Italy, Yugoslavia, Liberia, Luxemburg, Monaco, Nicaragua, Panama, Peru, Poland, Portugal, Rumania, Salvador, San Marino, Dominican Republic, Slovakia, Spain, Uruguay, Venezuela.

**The Cardinals.** No new Cardinals were created in 1940 and deaths reduced the Sacred College to 55, 15 short of its full complement. Emanuel Celestine Cardinal Suhard, Archbishop of Reims, was named to succeed Cardinal Verdier (q.v. under *NECROLOGY*) as Archbishop of Paris. Isidro Cardinal Gomá y Tomás, Primate of Spain and Archbishop of Madrid, died in August (q.v. under *NECROLOGY*).

**The Hierarchy:** The following episcopal appointments were made during the year: Most Rev. Guiseppe Beltrami was named Papal Nuncio to El Salvador and Guatemala, and titular Bishop of Damascus; Most Rev. Samuel A. Stritch, Archbishop of Milwaukee was made Archbishop of Chicago; Most Rev. Christian Winkelmänn, Auxiliary Bishop of St. Louis, Bishop of Wichita; Most Rev. Moses E. Kiley, Bishop of Trenton, Archbishop of Milwaukee; Very Rev. Sidney M. Metzger, titular Bishop of Birta and Auxiliary Bishop of Santa Fe; Rt. Rev. Msgr. Louis La Ravoire Morrow, Bishop of Krishnagar, India; Very Rev. Msgr. Joseph M. Corrigan, titular Bishop of Birta and Rector of Catholic University, D.C.; Rt. Rev. Msgr. Vincent J. Ryan, Bishop of Bismarck, N.D.; Rt. Rev. Msgr. George J. Donnelly, titular Bishop of Coela and Auxiliary Bishop of St. Louis; Rev. Henry J. O'Brien, titular Bishop of Silta and Auxiliary Bishop of Hartford; Most Rev. William A. Griffin, titular Bishop of Savanus and Auxiliary Bishop of Newark, Bishop of Trenton; Rev. Thomas A. Boland, titular Bishop of Hirana and Auxiliary Bishop of Newark; Rev. Bernard Theodore Espelage, O.F.M., first Bishop of Gallup, N.M.; Rt. Rev.

Msgr. Joseph P. Hurley, Bishop of St. Augustine; Most Rev. Joseph Charbonneau, Coadjutor Bishop of Montreal, Archbishop of Montreal; Most Rev. Joseph G. Pinten, retired Bishop of Grand Rapids, titular Bishop of Sela; Rt. Rev. Msgr. J. Francis A. McIntyre, Auxiliary Bishop of New York.

The following bishops died: Most Rev. Patrick Barry, Bishop of St. Augustine; Most Rev. Arthur Jerome Drossaerts, Archbishop of San Antonio; Most Rev. Thomas F. Hickey, retired Bishop of Rochester; Most Rev. John Henry Tihen, retired Bishop of Denver; Most Rev. Manuel Ruiz y Rodriguez, Archbishop of Havana; Most Rev. John March, Bishop of Harbor Grace, Newfoundland; Most Rev. Charles A. Lamarche, Bishop of Chicoutimi, Quebec; Most Rev. Edward J. Byrne, Archbishop of Dublin; Most Rev. Paulin Ladeuze, titular Bishop of Tiberius and Rector of the University of Louvain; Most Rev. Michael Kelly, Archbishop of Sydney, Australia; Most Rev. Justino Guitart y Villardero, Bishop of Urel, Spain; Most Rev. Casimir Michalkiewicz, Auxiliary Bishop of Wilno, Poland; Most Rev. Joseph G. Forbes, Archbishop of Ottawa; Most Rev. Alphonse E. Deschamps, Auxiliary Bishop of Montreal; Most Rev. Georges Gauthier, Archbishop of Montreal; Most Rev. Sylvester Espelage, O.F.M., Vicar Apostolic of Wuchang, China, and titular Bishop of Oreo; Most Rev. Stephen Alencastre, S.S.C.C., Vicar Apostolic of Hawaii.

**Statistics.** The total Catholic World population is approximately 350,000,000 or about 19 per cent of all. Figures compiled by the official Catholic Directory for 1940 lists the Catholic population of the United States at 21,403,136, a decrease from 1939 of 2371. The number of converts was 73,677 or 7734 more than in the previous year. The Hierarchy numbers 22 Archbishops, two of whom are Cardinals, and 114 Bishops. The secular priests number 22,450, a decrease of 119, and the priests of religious orders number 11,462, an increase of 491. The churches total 18,733, a decrease of 24, and include 13,132 with resident pastors and 5601 missions with churches. The number of seminaries decreased by 7, the total being 202; and the seminarians increased by 341, the total being 17,087. There are 143 colleges for boys, a decrease of 38. Colleges and academies for girls total 683, an increase of 6. There are 1411 high schools, 49 more than in 1939, with a total attendance of 480,483, a gain of 39,210. The number of parochial schools is 7597, an increase of 36, and an attendance of 2,108,892, an increase of 1922. The number of orphanages is 303, a decrease of 8; and the number of orphans cared for was 33,624, or 2582 less than previously. There are 171 homes for the aged poor, an increase of 4; and 703 hospitals, an increase of 24. There were at the end of 1939, 34 commissioned chaplains in the U.S. Army, 19 in the Navy, 66 chaplains in Veteran Hospitals and 21 auxiliaries, 164 military reserve chaplains, and 63 chaplains in the National Guard. See *CATHOLIC WELFARE CONFERENCE*; *FRANCE, GERMANY, HUNGARY, and POLAND under History*; *VATICAN CITY*.

**ROWING.** Among college boat crews, Washington and Cornell were pre-eminent during 1940. The former triumphed over California in its annual April regatta and then came east to win the Intercollegiate Rowing Association title on the Poughkeepsie in June. The Cornell team won the Carnegie Cup race from Yale by the margin of two-tenths of a second, one of the closest races in history, but finished second to California in the Poughkeepsie classic. The latter competition was marred by bad weather and confusion. In one event, the varsity crews were dispatched in waters that were so turbulent that most of the boats were swamped and the race called off. It was later conducted under cover of darkness, after the varsity race had run its course.

In the main event, after Washington and Cornell, the order at the finish was as follows: Syracuse, third, Navy fourth, California fifth, and Columbia sixth. The Washington jayvee aggregation won their event, followed by Navy, second, and Cornell freshmen, third.

It was a big season for lightweight crews. The Joseph Wright Cup, the trophy for 150-lb. oarsmen, was taken by Harvard at the American Henley. The National Association of Amateur Oarsmen staged its annual competition on the Shrewsbury at Red Bank, N. J., and here Joe Burk, the world's best-known sculler, won the national championship by outdistancing Theofeld Duboise, of Winnipeg, by 15 lengths.

The Penn A. C. of Philadelphia annexed the team title with a total of 98 points and won the Julius H. Barnes trophy. The eight-oared senior crew event was also taken by the Penn A. C.

At the New London regatta, the Harvard crew of Tom Bolles was easily supreme over Yale.

**RUANDA-URUNDI.** See under **CONGO, BELGIAN.**

**RUBBER.** For the first time in its history the American rubber manufacturing industry was faced last year with the possibility of having its basic raw material—crude rubber—cut off. The threat hinged on the international situation, and was heightened by Japan's joining the Axis powers in a tripartite agreement. There were veiled intimations from Japan that if the United States saw fit to consider that country as an aggressor nation and limit exports of strategic war materials, Japan, in turn, might be obliged to retaliate by cutting off

shipments of crude rubber from the Far East, from which the United States receives about 98 per cent of its rubber supplies.

That the Government recognized the difficulties which might accrue if crude rubber shipments were blocked, even temporarily, was evident by the action which followed. The Reconstruction Finance Corporation was authorized to create the Rubber Reserve Company, capitalized for \$5,000,000, half of which was subscribed by the government and the other half by independent rubber manufacturers, for the purpose of creating a stockpile of crude rubber to be used for "emergency" purposes only. The Rubber Reserve Company shortly after its organization concluded two separate agreements with the International Rubber Regulation Committee, the governing body of the current restriction plan, calling for the purchase of 150,000 tons in 1940 and 180,000 tons in 1941. By the end of 1940, it had accumulated in excess of 56,000 tons of stockpile rubber.

#### CRUDE RUBBER CONSUMED IN PRODUCTS MANUFACTURED IN THE UNITED STATES

[All Figures in Long Tons]

	First Nine Months 1940	1939
Passenger Car, Truck & Bus Casings	209,393	204,649

Foamed Latex	1,701	1,658
Sporting Goods, Toys & Novelties		
Grand Total	335,221	315,719

\* Including single tubes and juvenile pneumatic tires and tubes.  
 (A) Previously included with Passenger Car, Truck and Bus Casings and Inner Tubes Source: Rubber Manufacturers Association. The grand totals are estimated to be approximately 75% correct with regard to completeness.

The recognized danger of shortages of crude rubber due to an attempted blockade of shipping centers also led, indirectly, to the announcement of a new group of synthetic rubbers. The Standard Oil Company of New Jersey first announced that it had acquired the American manufacturing rights to Buna from I. G. Farbenindustrie, the chemical trust in Germany. Subsequently, Standard Oil licensed both Firestone and U.S. Rubber to produce Buna for their own requirements. Standard Oil later announced Butyl Rubber, a co-polymer of olefin and diolefin.

Other companies joining the synthetic rubber parade included Goodrich, with Ameripol, and Goodyear, with Chemigum. Later, the Goodrich company joined forces with the Phillips Petroleum Company to organize the Hydrocarbon Chemical and Rubber Company, in Akron, with the patents of both companies at the disposal of the new concern. Hydrocarbon Chemical calls its synthetic Hycar. Although it was not publicly announced,

Source: W. H. Rickinson & Son. Note: Totals for December and for the year were estimated by the author.

U.S. Rubber was also understood to have a new synthetic rubber ready for exploitation. It is believed, although secrecy surrounds the actual compositions, that all of these new synthetic rubbers, which will compete with DuPont's neoprene and Thiokol, made by Dow Chemical for the Thiokol Corporation, are based on butadiene.

\* At end of month or year Source Rubber Manufacturers Association

The domestic rubber manufacturing industry as a whole enjoyed a successful year. The larger organizations were busy on military orders from England and France in the first part of the year and then both large and small companies benefited from orders issued by the Government later in the year under the National Defense Program. By the year-end, defense orders placed with the industry, ranging from gas masks to new types of bullet-resisting inner tubes, were estimated at \$50,000,000. Due to these conditions, employment in the industry improved steadily, both with respect to numbers employed and man-hours of work provided.

Sources Rubber Manufacturers Association; W. H. Rickinson & Son. Note: Consumption in the United Kingdom is estimated since June, 1940. World Totals are completely estimated

Commercially, the rubber industry continued to expand. Goodyear finished the installation of the world's largest conveyor belt, carrying aggregate from gravel pits at Redding to the Shasta Dam at Caram, Calif., a distance of 96 miles. Uses of Pliofilm, the rubber hydrochloride material, were widened to include the packing of foods, meat-stuffs, etc. Bullet-resisting tires and bullet-sealing gasoline tanks for airplanes and military vehicles were developed. Armor plate of rubber and steel for military aircraft was introduced. A self-heating aviator's suit made its appearance. Advances in the casting of latex in plaster and other molds were recorded. Rubber dies were used for stamping out sheet metal parts for airplanes and other

uses. A new type of cotton tire cord, highly heat resistant, was developed by the National Cotton Council in co-operation with Firestone. Fiber-latex developments, of special interest to the textile trade, were announced.

Developments were achieved technically. Rubber compounded with acetylene black was found to be electrically conductive. Depolymerized rubber, prepared by the use of chlorostannic acid, was used in making thermoplastic resins. It was determined that latex could be sterilized in the presence of buffer solutions. Chlorinated rubber was employed for the manufacture of hard types of lacquer resistant to the action of sea water. Vulcanization of rubber plates without any forms was begun. Colloidal lead stabilized with 0.25 per cent rubber was found to impart anti-knock properties to gasoline.

The use of Meehanite and other new alloys, possessing increased tensile, good transverse, and high compression strength, combined with excellent corrosion resistance, marked the progress in rubber machinery and equipment. A new type press for curing sponge or blown goods, a constant control rubber thread covering machine, and equipment for producing rubber-insulated conductors by continuous vulcanization were included among the new equipment made commercially available. A tester for foamed latex sponge rubber, a V-belt measuring machine, a plastograph for measuring the consistency of rubber, and a fluoroscopic device for x-raying tires were among laboratory apparatus made available.

The big news within the industry itself was the acquisition of both the Fisk Rubber Corporation and the Gillette Rubber Company by U.S. Rubber. During the year, the Bata Shoe Company began operations at its new and first factory in the United States at Belcamp, Md. Goodyear constructed another factory at St. Mary's, Ohio. Goodrich began the construction of a plant at Niagara Falls, N.Y., for the manufacture of Koroseal. DuPont began work on its Deepwater, N.J., plant, to double the production of neoprene.

See CHEMISTRY, INDUSTRIAL; FLORIDA under History; SHOE INDUSTRY.

M. E. LERNER

**RUMANIA.** A monarchy of southeastern Europe. Capital, Bucharest. King, Carol II (abdicated Sept. 6, 1940) and Michael V (successor).

**Area and Population.** As a result of successive territorial cessions made during 1940, the area of Rumania was reduced from 113,884 square miles to about 88,714 and the population from an estimated 19,422,600 to about 12,958,269. Details of the ceded areas are given in the accompanying table and map.

**RUMANIAN TERRITORIES CEDED IN 1940**

Territories	Ceded to	Date	Area sq. miles	Estimated population
Bessarabia	USSR	June 28	17,151	3,200,000
Northern Bukovina	USSR	June 28	1,717	500,000
Northern Transylvania	Hungary	Aug. 30	19,300*	2,185,987*
Southern Dobruja	Bulgaria	Sept. 7	2,982	378,344
Total			25,170	6,464,331

\* Rumanian estimates. According to Hungarian estimates, the area ceded was 17,000 square miles and the population 2,370,000.

It was estimated that about half of the population lost by Rumania through these territorial transfers was Rumanian. Over 1,800,000 Rumanians were annexed by the Soviet Union, about 1,150,-

000 by Hungary and 78,000 by Bulgaria. Of the non-Rumanian nationalities in the ceded districts, about 1,875,000 were estimated to have been transferred to the Soviet Union, 1,200,000 to Hungary, and 300,000 to Bulgaria.

Populations (estimated, Jan. 1, 1939) of chief cities. (1) not ceded in 1940—Bucharest 648,162, Iasi (Jassy) 104,471, Galati (Galatz) 102,232, Timisoara (Temesvar) 89,872, Ploesti 77,376, Arad 75,725, Braila 68,561; (2) ceded in 1940—Chisinau (Kishenev) 112,500, Cernauti (Czernowitz) 109,698, Cluj (Klausenburg) 100,272, Oradea-Mare (Grosswardein) 80,872.

**National Defense.** The strength of the army in the latter part of 1940 was uncertain. The force was reportedly to be reorganized, on a reduced scale, in accordance with German design. On Nov. 1, 1939, according to the U.S.A. Adjutant General's office, the Rumanian army, prior to the territorial dismemberment of 1940, had 800,000 men in active service and 1,000,000 trained members of the reserve. In the air force were 15,472 men, equipped with over 800 aircraft. The navy maintained in the Black Sea 4 destroyers, 1 submarine, 3 torpedo boats (formerly Austrian), 4 motor-driven gunboats, and a depot ship. Patrol boats were maintained on the Danube River.

**Education and Religion.** Attendance at school is obligatory for those of proper age and is free in the public schools. In the academic year 1938-39 schools for infants and for elementary pupils, mainly public schools but others included, numbered 19,394 and had 2,623,000 pupils. In the year 1937-38, secondary schools, mainly public, numbered 925 and had 204,254 pupils. In the year 1938-39, other than elementary pupils above, 669,187 adults were instructed in elementary schools. Four universities were maintained, at Bucharest, Iasi, Cluj (in Transylvania), and Cernauti (in Bukovina), prior to the territorial cessions of 1940. By religious affiliation 13,200,000 of the population were reckoned in 1938 as connected with the Orthodox Church; 1,426,813 with the Greek Catholic; 1,200,000 Roman Catholic; 1,500,000 Jews (but after the cession, about 700,000); and smaller numbers in other groups, including 260,000 Moslems.

**Production.** Three-fourths of the population before the territorial cession were engaged in farming. The arable land totaled (1937) 34,448,000 acres, or 47.3 per cent of the territory. Production of cereals in 1939, by metric tons: Wheat, 4,452,800; barley, 816,400; rye, 431,500; oats, 487,000; maize, 6,051,200; potatoes, 1,988,400; the production of sugar from beets totaled 127,900 metric tons. The year's production of wine approximated 11,542,000 hectoliters, that of tobacco, 14,400 metric tons. The farms' live stock included in 1938, 2,024,540 horses, 4,170,640 cattle, 11,808,780 sheep, and 3,030,306 swine. Agriculture normally produced cereals, animals, and some animal products well in excess of domestic needs.

The chief mineral production, that of petroleum, attained 6,239,000 metric tons for 1939 and 6,601,000 for 1938; after Russia's it was the main part of Europe's production. Much of it was refined in Rumania; production of gasoline attained 1,529,000 metric tons for 1938. Wells delivered (1938) 1,725,000,000 cubic meters of natural gas. Mines produced (1939) 289,000 metric tons of coal and 2,183,000 of lignite. Salt mines (in the lower Carpathian area) produced 370,000 metric tons in 1938. Other mineral products were iron ore, pyrites, lead, zinc, and copper, all secondary as to quantity. Manufacturing employed (1937) 278,919 persons

in 3512 establishments; among the chief sorts of manufacture were flour-milling, brewing, and distilling.

**Foreign Trade.** For 1939, in millions of lei, imports 22,846; exports, 26,809. For 1938, imports 18,768 and exports 21,533. Petroleum products and cereals accounted for most of the amount of exports: in 1938, petroleum products for 9313 millions of lei and cereals for 5257. Chief imports of 1938 in millions of lei; iron and steel, 4060; machinery, 3578; textiles, 2848. Germany took, of the exports of 1938, 5707 millions of lei and sent, of the imports, 6908; the United Kingdom took 2386, sent 1529; Czecho-Slovakia took 2059, sent 2465; France took 1006, sent 1444.

**Finance.** Monetary unit, the lei; quoted nominally in 1939 around 0.71 cent in U.S. money at New York; officially rated value in U.S. money, December, 1940, 0.46 cents. The budget for the year 1939-40 estimated ordinary revenue and expenditure, alike, at 32,229 millions of lei; for 1938-39, at 30,550. For 1939-40 a special budget for national defense carried an additional 6000 millions. Public debt, Apr. 1, 1939, 104,127.4 millions. The National Bank's gold, 21,028 million lei, was revalued in May, 1940, at 31,542 million.

**Government.** The Constitution of Feb. 27, 1938 (see YEAR BOOK, 1939) was suspended and Parliament dissolved on Sept. 5, 1940. By royal decrees of September 5-6, all of the governing powers, except command of the army and the rights to issue currency and grant decorations and amnesty, were transferred to Gen. Ion Antonescu, Head of the State and Premier. The Crown Council created in 1938 likewise was abolished. King Carol's Front of National Regeneration, which in 1938 replaced all political parties, was replaced by the Iron Guard in September, 1940. The cabinet appointed Sept. 14, 1940, was composed of Iron Guard leaders, army officers, and non-party technicians.

## HISTORY

Rumania gave up to Russia, to Hungary, and to Bulgaria in 1940, without attempting a blow in defense, nearly one-fourth of its area and one-third of its inhabitants; and its ruler, King Carol II, abdicated and went into exile. These changes marked the failure of the country's attempt to retain territory that it had gained by the downfall of Germany and her partners in the previous European war; about two-thirds of the territory then acquired was now given up. The failure also of the monarchy's policy of courting one strong protector after another, standing by none, became manifest.

**Events Leading to the Partition.** The demands of Russia, of Hungary, and of Bulgaria on Rumania were of long standing. Russia had begun its efforts to recover Bessarabia soon after the full establishment of the U.S.S.R. The irredentist movement in Hungary was as old as the existing Hungarian government. The new European war, breaking out in 1939, brought on an open season for territorial seizures outside the main field of struggle. The downfall of the resistance to Germany in western part of the European continent made it simple for Germany to reach out a hand toward the Rumanian resources and necessary for Russia to gather its intended share of that country's territory quickly. The situation for which the seekers of Rumanian territory had long waited thus came about in June.

**Steps in the Partition.** Russia brought into

#### THE PARTITION OF RUMANIA

Bessarabia and Northern Bukovina were ceded to Soviet Russia on June 28. Half of Transylvania was annexed to Hungary under the "arbitral award" announced by the German and Italian Foreign Ministers at Vienna on August 30. Southern Dobruja was ceded to Bulgaria by a Rumanian-Bulgarian treaty signed September 7.

position in May a force for crossing the Dniester River into Bessarabia. In the middle of June conferences between Russia and the Axis powers were reported as preparing an agreement on the approaching partition. The first noteworthy encounters of Russian and Rumanian troops along the Dniester were reported on the 24th. On the 26th Russia demanded of Rumania the return of Bessarabia to Russia and the transfer of Northern Bukovina; Rumania was told to agree within 24 hours. It agreed to the cession on the following day and on June 28 details of the transfer were completed.

Hungarian troops began skirmishing with Rumanian forces on the Transylvanian border on July 2. On July 24, Hitler summoned members of the Rumanian ministry to a conference, July 26, at Salzburg. There followed conferences between the Hungarian and Rumanian governments and, in August, the submission of the Hungarian demands to arbitration by both the Hungarian and Rumanian governments. The Foreign Ministers of Germany and of Italy, Ribbentrop and Ciano, acting as an arbitral court, issued, August 30, an award delivering to Hungary the more northerly part of its former Transylvanian territory. The Rumanian Government accepted the award. The Bulgarian claims, which had also been pressed in July, were settled by a treaty between Bulgaria and Rumania, signed September 7, Rumania ceding the southern part of Dobruja. See BULGARIA and HUNGARY under History.

**Rumanian Diplomacy.** The government of Rumania used diplomacy to avert if possible, or

diminish the severity of its neighbors' territorial demands. It avoided any effort at adequate military resistance; but as far as offering the semblance of a determined military front might discourage aggression, it did what it could. The forces on the frontiers were repeatedly augmented early in the year, and King Carol in a public address declared the readiness of the people to die in the nation's defense.

No apparent effort was made to win help from opponents of the Axis, despite the conditional 1939 Anglo-French guarantee of Rumania's territorial integrity. Great Britain was for the moment overburdened with its own difficulties and France was prostrate. Members of the Balkan entente were quite inadequate to take on the protection of other territory than their own. Rumanian readiness to submit to German-Italian arbitration in Hungary's favor was due partly to fear of further Russian penetration; partly also, to dread of the Iron Guard, of which Germany had at the critical moment sent back a formidable number, refugees in Germany, to their own land. The award to Hungary, indeed, did leave to Rumania the southern part, somewhat less than half, of the territory originally taken from Hungary. The policy of favoring Germany had the drawback of affording free ingress to the German agents of economic penetration and, especially, to German troops, which first entered in the guise of protectors against further Russian inroads. The discredit that these calamities brought on the government impelled King Carol to make repeated changes in the ministry.

**Fall of King Carol.** Whatever the merit of the policy of seeking German good will, it did not serve to save Carol II's crown. German influence was not used to support him. Threatened with an uprising by his bitterest enemies—the Iron Guards, of whom his government had executed a great number after their assassination of Premier Calinescu in 1939—he was forced to leave the country. He wrote his abdication, September 6, designating his 18-year-old son Michael as his successor. After fleeing to Switzerland, he made his way to Portugal. The reins of government were left in the hands of General Ion Antonescu, a former political opponent, whom Carol as a last resort had released from confinement and vested with broad powers.

**Uprisings under Antonescu.** The state of the country, as Antonescu carried on the government after Carol's departure, invited civil war. The throne stood in discredit as having failed to prevent the year's national disasters. The new sovereign was familiar to the people—he had been a child king during the years of Carol's exclusion from the succession, and his father had supplanted him. He was not a figure to command loyalty as the evident possessor of personal powers adequate to his station. The Iron Guards, re-established in the country since spring, had a sympathizer or agent in the ministry, in the person of Vice Premier Horia Sima. Divided among themselves, they could not well unite even to the point of coming to an agreement with the government. Sima was believed to stand with the most influential of their factions. The Russian occupation of Bessarabia had meanwhile helped bring into Rumania the Communist propaganda, and it had made progress amid the disordered state of the nation. Nor could the government proceed easily against either Communists or Iron Guards, since in either case it would risk offending one of the powers from which it had most to fear, Germany and Russia.

Late in November occurred a number of assassinations of persons of note who had incurred the resentment of the Iron Guards. Sixty-four officials who had served under Carol II were reportedly killed on November 27 alone. The "executions" were regarded as having been carried out to avenge that of the Iron Guard leader Codreanu in 1938. A number of Rumanian intellectuals were among those killed. The question how far the German authorities had sympathized with or promoted this retribution made it difficult for the government to take steps against the perpetrators. In the absence of such steps persons apprehending a like fate took alarm and fled from the country in considerable numbers. The Russian authorities protested to Antonescu against his failure to repress the Iron Guards' acts against Communists.

**The Rumanian Earthquake.** On November 11 an earthquake said to be the most destructive in Rumanian records killed a great number of persons (388 deaths reported), did widespread damage to buildings in Bucharest and other cities, and caused fires and other damage among the oil wells. Ploesti, in the oil region, was reported to have suffered heavily. See EARTHQUAKES.

Interruption of the operations of damaged oil refineries deprived Germany for some weeks of their output of liquid fuels, important to German warfare since Rumania was the chief source of such fuels under German control.

**Subservience to Germany.** Antonescu's government, facing the risk of violent opposition from either or both the German-minded Iron Guard and

the Russian-minded Communists, had no choice but to yield to Germany a broad economic mastery of Rumania. An economic agreement with Germany (reported in December) allowed German supervision of virtually all Rumanian industry under what was termed a co-operative plan for reconstructing the country's business. Antonescu promptly furthered the agreement by expropriating the private interests, largely British, that owned and operated properties for the production and refining of petroleum. The question of the treatment of the Rumanian Jews remained in doubt at the end of the year; the government published, November 25, some results of an investigation of their number and status; 662,244 had been questioned, and their total number was supposedly about 700,000.

**RUSSELL SAGE FOUNDATION.** See BENEFACTIONS.

**RUSSIAN LITERATURE.** Judging by preliminary reports, over 26,000 books, from fiction and poetry to scientific works, were published in the Soviet Union in 1940; that marks a decrease of about 5000 items in comparison with 1939.

**Fiction.** In rather poor literary quality, choice of subjects, and prevailing atmosphere, the year's fiction differed but little from that of 1939. Among the best artistic achievements, *The Dark Morning* (*Khmuroe utro*), by A. Tolstoy, and the last volume of M. Sholokhov's *Quiet Flows the Don* (*Tikhii Don*) stand out. Tolstoy is a distant relative of L. Tolstoy and an uncrowned king of Soviet authors. *The Dark Morning* is the continuation of his much earlier work entitled *The Road to Calvary* (*Khozhdenie po mukam*). Together, they form a very powerful, swiftly moving panorama of pre-revolutionary and revolutionary Russia, replete with color and "life-sap." The present work covers the momentous year 1918. The last volume of Sholokhov's panoramic novel brings to conclusion the chronicle of a Cossack family which the author has traced all through the First World War and the Soviet revolution. Although at places unnecessarily long, the steady epic narrative has substantial literary merits.

Of the novels devoted to contemporary Soviet life, *Warm Mountains* (*Tyopliya gory*), by S. Krushinsky, must be noted. It portrays truthfully, if not artistically, the life of "collectivized" Russian peasants, the daily struggle of their individualistic instinct against "the rural Socialism," and the activities of the persecuted, but still surviving, Church. In *By the Blue Sea* (*U sinevo moria*), Vladimir Ivanov draws, in major key, a picture of an industrial community and the milieu of new "Soviet-type" intellectuals. Much attention was attracted by R. Fraerman's *Dingo, the Wild Dog* (*Dikaia sobaka Dingo*), a romanticized story of "return to nature," of "primitive life" in the woods and of a first love; some of its pages are written remarkably well. M. Zoschenko, the famous humorist, wrote a new volume of *Short Stories* (*Rasskazy*), among which there are excellent, subtle satires of Soviet life told in his inimitable manner of a shrewd simpleton. Of the numerous his-

torical novels, *The Great Mouravi (Velikiy Mouravi)*, by Miss A. Antonovsky, deserves mention for a very detailed portrayal of the colorful Georgian (Caucasian) life in the 16th century which it contains.

The present war found but little reflection in the year's fiction. As a general European phenomenon, it is treated in hardly any book. It is to the localized Russian end of it alone, that is, to the absorption (or "liberation") of parts of eastern Europe by the Soviets, to the Russo-Finnish War and the like, that a few works were devoted. Among the most readable of them is *The Road to the West (Doroga na zapad)*, a collection of short stories by V. Lidin, depicting the sweep of the Red Army into Poland. That reticence on the European aspect of the war is in line with the policy of the Soviets which have maintained all along that it has no bearing to speak of on the life of Soviet citizens.

In 1940, some Moscow writers for the first time spoke frankly of the deplorably low level of literary skill prevailing in Soviet fiction. Thus, A. Kozachinsky published, in the *Literary Gazette*, an article entitled *In Defence of the Amusing (V zaschitu zanimatelnosti)*. Most Soviet fiction works, he asserted, were so unamusing that, if numerous Government-controlled libraries did not buy them, they would not sell at all.

**Autobiography, Biography, and History.** In this branch of literature, the year was not rich in important items. *From the Shovel to Stalin's Plane (Ot motygui k stalinskomu samolyotu)*, which is a posthumously published autobiography by Mrs P. Ossipenko, a noted aviatrix who had perished in an accident, received much praise. *Lermontov's Creative Path (Tvorcheskii put Lermontova)*, by L. Ginsburg, is a well-documented and, on the whole, interesting work. In the mass of historical writings, *Highlights of the Historical Development of the Western Ukraine and Byelorussia (Osnovnyye momenty istorii razvitiia zapadnoy Ukrainy i Belorussii)*, by V. Picheta, a noted authority on the subject, deserves notice. From M. Levchenko's pen came an informative *History of Byzantium (Istoria Vizantii)*.

**Drama and Poetry.** Among the new plays, *The Snow Storm (Metel)*, by the talented L. Leonov, stands out. It is a forceful story of a petty-bourgeois family of Old Russia which has fully adapted itself to Soviet conditions. Communist critics condemned it for its "unhealthy political tendencies." Typical of the Soviet Union's new nationalistic tendencies is the amusing *Kremlin's Chimes (Kremlyovskie kuranty)*, by N. Pogodin, in which Lenin is pictured as far more of a Russian nationalist than he had ever been. A Prokofiev's *In Defence of those in Love (V zaschitu vlyublyonnykh)* is probably the best volume of the year's lyrical poems.

**Literatures of Non-Russian Peoples of the Soviet Union.** In late years, the Soviets have been stimulating with increasing energy the development of the cultures and literatures of various non-Russian peoples comprised in the Soviet Union, from Georgians to Moldavs, Tartars, etc. Huge sums are being spent on the publication of their works in their native tongues and also on their translation into Russian. In 1940, such translated works held a place of great importance in the publishers' lists in Moscow. Among the most important of such works was the Russian version of *Djangan*, a long cycle of remarkable heroic poems composed in the 15-17th centuries by the peo-

ples of Mongolia. Much attention was also given to the *Works (Proisvedeniia)* of A. Tzereteli, a Georgian poet-revolutionist of the 19th century.

**Émigré Literature.** War conditions and, especially, the collapse of France put an end, at least for the time being, to the activity of Russian émigré writers most of whom lived in Paris. The only émigré work of importance that appeared in 1940 prior to June was *Solus Rex*, a highly original semi-fantastic novel by the brilliant V. Sirin-Nabokov.

**RUSSIAN ORTHODOX CHURCH.** See RELIGIOUS ORGANIZATIONS.

**RUSSIAN SOVIET FEDERATED SOCIALIST REPUBLIC.** See UNION OF SOVIET SOCIALIST REPUBLICS under *Area and Population*. **RYAN COLLECTION.** See ART under *Art Sales*.

**RYE.** The United States rye crop in 1940 was estimated at 40,601,000 bu by the U.S. Department of Agriculture compared with the 1939 crop of 39,049,000 bu and the 1929-38 average production of 38,095,000 bu. The 1940 production was obtained largely from smaller acreages sown in six north-central states which accounted for two-thirds of the U.S. rye production. Although the area harvested, 3,192,000 acres, was 17 per cent below the 1939 acreage and 2 per cent below the 10-year average, yields per acre were above average in most of the principal rye states. Acre yields averaged 12.7 bu in 1940 and 10.2 bu. in 1939. Major rye states were: North Dakota with 9,776,000 bu, Minnesota with 5,958,000 bu, South Dakota 5,640,000, Nebraska 2,608,000, Wisconsin 2,509,000, Indiana 1,785,000, and Ohio 1,683,000 bu. The season average price per bu. (preliminary) received by farmers was 40.6 cents and the value of production was estimated at \$16,498,000 in 1940 compared to 44.0 cents and \$17,163,000 in 1939. See AGRICULTURE,—*Crop Production Table, Imports and Exports*.

**ST. LAWRENCE SEAWAY.** See CANADA under *History*; DAMS; POWER PLANTS; WATERWAYS, INLAND.

**ST. LUCIA.** A British insular colony in the Windward Islands group of the West Indies. Area, 233 square miles; population (1939), 69,084. Chief towns: Castries (capital), 12,000 inhabitants; Soufriere, 7309. Education (1938): 45 schools and 10,210 pupils enrolled. Chief products: sugar, copra, limes, cacao, and bananas. Trade (1938): imports, £189,303; exports, £169,907, including re-exports of £43,267. Sugar accounted for over 47 per cent of the total domestic export trade.

**Government.** Finance (1939): estimated revenue, £82,371; estimated expenditure, £95,498. The colony is governed by an administrator (subordinate to the governor of the Windward Islands), aided by an executive council. There is a legislative council of 12 members, including the gover-

nor as president. Administrator, Arthur Alban Wright (appointed June 10, 1938).

**History.** The "western coast" of St. Lucia was one of the sites in which the U.S. Government was authorized to establish naval and air bases in the Anglo-American notes exchanged Sept. 2, 1940. The exact sites selected were announced in November as follows: (a) a seaplane base of approximately 120 acres at Gros Islet Bay on the north coast and (b) a larger area at Vieuxfort at the southern end of the island for a heavy bomber base. Surveys and other preliminary work for the construction of these bases were reported under way at the year end. See *BRITISH WEST INDIES* and *GREAT BRITAIN* under *History*.

**ST. PIERRE AND MIQUELON.** A French colony named after the main islands in two small groups, near the south shore of Newfoundland Area of St. Pierre group, 10 square miles; Miquelon group, 83 square miles. Total population, 4175. Capital, St. Pierre. Cod fishing is the chief industry. Trade (1938): imports, 27,-709,000 francs; exports, 19,240,000 francs (franc averaged \$0.0288 for 1938; \$0.0251 for 1939). The various governmental departments were under the control of an administrator who was assisted by a consultative council of administration.

**ST. VINCENT.** See *WINDWARD ISLANDS*.

**SAKHALIN.** An island north of Japan Area, 28,597 square miles. The northern part (14,662 sq. mi.) belongs to the U.S.S.R.; the southern part (13,934 sq. mi.), called KARAFUTO, belongs to Japan.

**SALVADOR, EL.** A republic of Central America. Capital, San Salvador.

**Area and Population.** The smallest and most densely populated of the Central American states, El Salvador has an area of 13,176 square miles and a population estimated at 1,744,535 on Jan. 1, 1940. Indians and mestizos constitute the vast bulk of the population, but the small ruling class is largely of Spanish descent. Populations of the chief cities: San Salvador, 102,316 (1937); Santa Ana, 83,302; San Miguel, 44,793; Santa Tecla, 33,331; Ahuachapán, 31,245; San Vicente, 28,760; Zatecoluca, 26,676; Sonsonate, 21,138.

**Defense.** The active army as of Nov. 1, 1940, numbered about 4500 men. Military service is compulsory in wartime.

**Education and Religion.** Illiteracy remains widespread. Of 12,674 persons married in 1937, 55 per cent of the men and 64 per cent of the women could not read or write. The 1940 budget allotted 2,228,000 colones for education. The latest educational statistics showed 63,387 primary and 1216 secondary students and 395 enrolled in the National University. Roman Catholicism is the dominant religion.

**Production.** Coffee exports (55,792,000 kilos of 22 lb. in 1939) accounted for 84 per cent of the value of all exports. A census ended May, 1939, showed 139,940,727 coffee trees on 11,545 fincas (estates) owned by 10,921 proprietors and aggregating 202,432 acres. Gold and silver, sugar, balsam, and henequen were the other main exports. Rice, corn, tobacco, etc., are other crops. Cattle and hog raising are important local industries. The forests yield indigo and cabinet woods. A factory makes henequen bags for shipping coffee.

**Foreign Trade.** Imports in 1939 totaled 22,100,-000 colones (22,866,700 in 1938); exports, 31,875,-700 (27,365,000). Coffee exports, 1939, were 26,-641,900 colones. The United States purchased 60

per cent of the 1939 exports; Germany, 9.0; Norway, 7.2. The United States supplied 53 per cent of the imports in 1939; Germany, 17.5, United Kingdom, 6.9 per cent. See *TRADE, FOREIGN*.

**Finance.** Effective Jan. 1, 1940, the budget was changed to the calendar year basis. For the interim period (July 1-Dec. 31, 1939) revenues were 9,995,000 colones and expenditures 10,103,000 colones. The 1940 budget estimates were: Revenues, 24,267,000 colones (22,047,000 in 1941); expenditures, 24,258,000 (22,044,000 in 1941). Public debt on July 31, 1940: 39,973,000 colones (external, 36,-561,000; internal, 3,412,000). The exchange value of the colon remained stable at about \$0.40 during 1940 and preceding years.

**Transportation.** In 1940 there were about 378 miles of railways; 3691 miles of national and municipal roads (1640 miles improved); and air lines connecting San Salvador with other Central American cities and all points on the inter-American air network. The chief ports are La Unión, La Libertad, and Acajutla, entered by 698 ships in 1938.

**Government.** The Constitution of Jan. 20, 1939, vests executive power in a President elected for six years and ineligible to succeed himself. Legislative power rests in the unicameral National Assembly of 42 members elected for one year by universal suffrage. President Maximiliano H. Martínez seized power through a military coup Dec. 2, 1931. After serving out his predecessor's term, he was selected for a four-year term beginning Mar. 1, 1935, and on Jan. 21, 1939, his term was extended for six years to Jan. 1, 1945, by a hand-picked Constituent Assembly (see 1939 *YEAR BOOK*, p. 693).

**History.** The political situation in El Salvador remained relatively quiescent during 1940 but economic conditions deteriorated as a result of the spread of the European War to Scandinavia. This eliminated markets that normally absorbed 35 per cent of the republic's coffee exports. The immediate result was a fall in coffee prices to the approximate level of production costs and the depression of all other business activities except construction of small private residences, regarded as the safest investment under existing conditions. The financial position of the government remained strong, however, and it proceeded actively with the construction of highways and other public works. Negotiations were in progress for government purchase of the pier at La Libertad, seaport of the capital. In his message of Feb. 15, 1940, to the National Assembly, President Martínez said that the effects of the war upon Salvadorean economy "obliged us to continue the suspension of the debt service." Interest and amortization payments on the foreign (dollar) debt had been in default since Nov. 27, 1937.

El Salvador joined with the other Central American republics in supporting United States and inter-American policies of hemisphere defense. In May President Martínez co-operated in the inter-American protest against the German invasion of Belgium, Luxemburg, and the Netherlands. When Italy declared war on France, the government permitted 300 Black Shirt members of the local Italian colony to parade through San Salvador, but immediately afterwards a law was adopted banning foreign political propaganda. On June 16 students in the capital held a pro-French demonstration before the French Legation. President Martínez condemned the European dictatorships in an address on October 18. Baron Wilhelm von Hundelhausen, former German manager of the

government-owned mortgage bank, was expelled from the country in December.

See **PAN AMERICANISM**.

**SALVATION ARMY, The.** A world-wide organization with international headquarters at 101 Queen Victoria St., London, England, whose purpose is the salvation of mankind from all forms of distress—spiritual, moral, temporal. The movement was first organized as The Christian Mission in the East End of London in 1865 by William Booth, and, in 1880, was extended to the United States. The government is military in character with Gen. George L. Carpenter as international head. The doctrine of The Salvation Army is a simple evangelical creed based on the Methodism from whence it came.

The Salvation Army is now active in 97 countries and colonies, carrying on its work in 104 languages. There were in its service in 1939, 27,417 officers and cadets; 11,003 persons without rank wholly employed; 160,203 honorary local officers and bandmen; 84,961 songsters; 34,219 corps cadets; and 17,816 corps and outposts in operation. Social welfare institutions and agencies numbered 1684, free day schools 1132, and Naval and Military Homes 35. It published 126 periodicals, with a total average circulation of 1,441,783 copies per issue.

There were in the United States in 1939, 1638 corps and outposts, 4 Training Colleges, 4821 officers and cadets, and 44,247 honorary local officers and bandmen. Converts during the year numbered 68,031. Social Welfare institutions included 125 men's hotels and 16 residential hotels for young women, accommodating a total of 10,580. Men's Social Service Centers numbered 112 with accommodation for 5373; 9 children's homes and hospitals with accommodations for 846; 36 women's homes and hospitals with accommodations for 2184; and 2 dispensaries and 5 clinics which treated 20,503. At Thanksgiving and Christmas free dinners were given to 530,556 persons and toys to 363,703 children. During 1939, 9847 prisoners on discharge were assisted by The Salvation Army; 82,989 mothers and children were given summer outings; 76,000 men and women were given employment through the Army's 61 free employment bureaus; and 867 missing persons found.

The National Headquarters of The Salvation Army in the United States are at 120 West 14th Street, New York City. National Secretary, Commissioner Edward J. Parker.

**SAMOA.** A group of 14 islands in the Southern Pacific, about 4000 miles southwest of San Francisco. The islands of the group east of 171° W. longitude belong to the United States; those west of that line are administered by New Zealand under a mandate of the League of Nations.

**American Samoa.** American Samoa comprises the islands of Tutuila, Tau, Olosega, Ofu, Annuu, and Rose Island. Swains Island is included in the administrative district of American Samoa. The total area is 76 square miles and the estimated population on July 1, 1940, was 12,962, mostly Polynesians and half-castes. The Naval Station at Pago Pago is the seat of government. The population of the town was approximately 1000. The harbor is one of the best in the South Seas. The average school enrollment in 1939-40 was about 3260. Instruction is in English. Copra produced and exported in the fiscal year 1939-40 was 766 tons valued at \$28,473. The value of imports during the same year was \$76,741; exports, \$75,729. Governmental revenues in 1939-40 were \$110,027; expend-

itures, \$114,341. The islands are under the jurisdiction of the U.S. Navy Department and are administered by the commandant of the naval station at Pago Pago. There is a native advisory council called the Fono, which meets annually. Governor, Capt. Lawrence Wild, U.S. Navy (assumed office, Aug. 8, 1940).

**SAN FRANCISCO GOLDEN GATE EXPOSITION.** See **FAIRS, EXPOSITIONS, AND CELEBRATIONS**.

**SANITATION.** See **GARBAGE AND REFUSE DISPOSAL; SEWERAGE AND SEWAGE PURIFICATION; WATER WORKS AND WATER PURIFICATION**.

**SAN MARINO.** An independent republic in Italy, near the town of Rimini. Area, 38 square miles; population (1939), 14,545. Capital, San Marino. Chief exports: cattle, wine, building stone. Financial estimates (1939-40) were balanced at 6,009,919 lire (lira averaged \$0.0520 in 1939). The legislative power is in the hands of the grand council of 60 members elected by popular vote. Two are appointed from this council every six months to act as regents.

The government continued San Marino's neutrality after Italy's entrance into the European War on June 10, 1940, according to a statement issued Dec. 13, 1940, by the consul general of the republic in New York.

**SANTA CRUZ DE TENERIFE.** See **CANARY ISLANDS**.

**SANTO DOMINGO.** See **DOMINICAN REPUBLIC**.

**SÃO THOMÉ AND PRINCEPE.** See **PORTUGAL** under *Colonial Empire*.

**SARAWAK.** See **BRITISH MALAYA**.

**SASKATCHEWAN.** A prairie province of Canada. Area, 251,700 square miles; population (1939 estimate), 949,000, as against (1936 census) 930,893. Vital statistics (1939): 18,019 living births, 6018 deaths, 7307 marriages. Chief cities (1936 census): Regina, the capital (53,354), Saskatoon (41,734), Moose Jaw (19,805), Prince Albert (11,049), Swift Current (5074). Education (1937-38): 234,139 students enrolled in schools of all kinds, including 5901 in schools of higher education.

**Production.** The gross value of agricultural production for 1939 was \$213,412,000. Field crops, sown to a total of 20,749,200 acres in 1939, were valued at \$166,633,000. Chief field crops (1939): Wheat 250,000,000 bu., oats 112,000,000 bu., barley 26,000,000 bu., rye 9,300,000 bu., flaxseed 1,200,000 bu., potatoes 86,050 tons, hay and clover 445,000 tons, alfalfa 57,000 tons, fodder corn 38,000 tons. Livestock (1939): 1,170,000 cattle (including 490,000 milch cows), 800,000 horses, 470,000 swine, 341,000 sheep, 9,512,000 poultry. Fur production (1938-39) was worth \$983,400 (\$852,147 in 1937-38). Forest production (1938) was equal to 81,443 M cu. ft. and valued at \$2,252,936.

**Mineral production (1939)** was valued at \$8,794,090, including gold (77,120 fine oz.) \$2,787,194, copper (18,143,149 lb.) \$1,829,997, zinc (37,278,001 lb.) \$1,144,062, coal (959,595 tons) \$1,255,142, silver (1,141,600 fine oz.) \$462,211. Manufacturing (1938): 678 factories, 6123 employees, \$16,143,335 net value of products.

**Government.** Financial estimates (year ended Apr. 30, 1940): Revenue, \$23,325,439; expenditure, \$23,656,200. The King is represented by a lieutenant governor (appointed by the governor general in council) who is assisted by a ministry which is responsible to the legislature and resigns office when it fails to retain the confidence of that

body. In the legislative assembly there are 52 members elected by popular vote. Six senators and 21 commoners represent the province in the Dominion parliament at Ottawa. Lieutenant Governor, A. P. McNab (appointed Oct. 1, 1936); Premier, W. J. Patterson (Liberal). See CANADA.

**SAXONY.** See GERMANY under *Area and Population*.

**SCALISE, George.** See LABOR CONDITIONS under *Union Movements*.

**SCANDINAVIAN LITERATURE.** Norwegian. Freedom of expression was abolished when the Nazis invaded Norway on Apr. 9, 1940. The press was placed under rigid censorship; the broadcasting system was taken over by the invaders, and no public statement involving the new regime was permitted. Norwegian authors' answer to official decrees forbidding the printing of free thought emerged in anonymity. Prose and poetry, magnificent in their manifestation of the true spirit of Norway, has flowed from attics and cellars where mimeograph machines have replaced the smooth-running presses of other days. Passed by hand from man to man this nameless literature has fed Norse contempt for the invader, and crystallized his determination to resist nazification at all cost. This is the important literary production in Norway of 1940, and some day names may be mentioned—but not now.

The publishing houses of Oslo can claim no great books for the seasons of 1940. Some of the better known names appear, but others are missing. Whatever Sigrid Undset had to say she has said from lecture platforms in the United States. Knut Hamsun turned Nazi. The Tiden Norsk Forlag, liberal publishing house closely identified with the labor party, issued no list at all. Not a single book deals with the tragedy of Norway. Aksel Sandemose, stormy petrel of pre-invasion literary Norway, authored a timid collection of short stories *Fortellinger Fra Andre Tider* (Tales from other Days). Arthur Omre produced a novel with the sinister title *Det Onde Øie* (The Evil Eye). Barbra Ring escaped from the realism of Nazidom to the nostalgic yearnings for yesteryear, naming her book *Saam er Norge* (Such is Norway), a potpourri of eulogies of the scenic grandeur of the land. Nils Johan Rud has approached the Nazi danger zone in his novel *Godt Mot, Menneske* (Heads High, Men) in which the horrors of the 1940 springtime are woven into a backdrop for the theme of his book. Arnulf Overland, the great poet, presented the people of Norway with a volume of verse *Ord I Alvor til det Norske Folk* (Words in Earnest to the Norwegians). From Gyldendal publishing house came a remarkable book, a compilation of excerpts from literary masterpieces of bygone days, showing how the Norwegian people weathered other crises, *Haarde Tider Har Vi Døiet* (We have lived through Hardships Before). Herman Wildenvey adds another chapter to his autobiography, and probably had his tongue in his cheek when he named it *En Lykkelig Tid* (Days of Joy). Magnhild Haalkes's facile pen and keen understanding of plain people resulted in a story of a country teacher's struggle against prejudice. Her novel *Trine Torgersen* won first prize in a literary contest. Gabriel Scott wrote *En Drom om en Drom* (A Dream of a Dream), a novel about a young author who leaves his laurels to meet the world.

**Danish.** Danish writers of 1940 have detoured around the European war and the Nazi invasion of their country. The great novelist, Johannes V.

Jensen, added a new collection of myths to his famed cyclus, now numbering eight volumes; he calls his current work *Mariehønen*; it spans the glacier period in Denmark and a six day indoor bicycle race in America. Thit Jensen wrote a historical novel based on the life of *King Valdemar Atterdag*. Johannes Wulf presents the case history of an office clerk versus complete freedom; his book is called *Fast Ansatt* (Steady Job). Cai M. Woel is another author who has dipped into past history, coming up with *Riget af Evighed* (The Eternal Kingdom), a book about Canute the Holy and his dramatic escape from the peasants of Jutland. The bitter struggle of the unemployed is vividly portrayed by a new writer, Eigil Jensen; his novel is named *Hoer Var Der Ikke en Som Lo* (Wasn't That Someone Laughing). Jorgen Nielsen reappears on the literary scene after an absence of several years; his novel *Dyb et* (From the Depths) is a fine study in child psychology. Erik Bertelsen depicts the hardships of Danish fishermen on the west coast in the latter part of the eighteenth century, *Kvinder ved Stranden* (Women of the Coast). Karen Aabye tackles the problems of bachelor girls: if the self-supporting woman of today can retain her primitive instincts, she will do all right. The title of her novel is *En Kvinde Har Alt*. Aage Krarup-Nielsen has written a historical thriller, *Hans Falk Fra Maketu*, a story of a Danish soldier of fortune from Napoleonic days. Tom Kristensen has opened the drawers of his writing desk and blown the dust off poems at random, calling them *Digte I Dugnet* (Poems of yesterday). Kristensen thinks it is good for the soul to do a little retrospecting in these terrible times. Hakon Stangerup reviews living Danish literature from Saxo to Jacob Paludan, *Levende Dansk Literatur*.

**Swedish.** Of the three Scandinavian countries Sweden is the only one to escape invasion and attempted nazification; freedom of expression still prevails, and the literary production in 1940 in Sweden is rich and full with a noticeable stress on informative literature and current cultural trends. There is also poetry, such as the glorious *Saang och Strid* (Song and Struggle) by Par Lagerkvist, including poems on the tragedy brought on by the invasion of Norway and Denmark. Marika Stiernstedt appears with a voluminous novel, *Man Glömmmer Ingenting* (Nothing is Forgotten); it is an able presentation of the problems of art and love between two artists, the male species of whom is encumbered with a lawful wife. Sigfrid Siwertz has written a fascinating book on dreams, *Mer Än Skuggor* (More than Shadows). In the experimental vein it is a promising addition to contemporary Swedish literature. Another berth for the fantastic is provided by Karin Boye whose brilliant book *Kallosan* leads the reader into the State of the future. Albert Olsson has gone to 16th century Sweden for some excellent material for his work *Sand*, the story of a proud landowner with a social conscience. K. G. Ossiannilsson offers a challenge to the meek in his novel *Livet Maaste Levas* (Life Must Go On); the moral of the book is that it will never do to resign to the fact that this is an evil world, but rather that one should fight it. One of the most significant literary works of the year in Sweden is Eyvind Johnson's *Soldatens Återkomst* (Return of the Soldier). It has the blood and bones and sinews of the present conflict between freedom and totalitarianism. The Soldier is the soldier of the North, the young man who left his safe haven to carry arms for Loyalist

Spain, Fighting Finland, and Invaded Norway. Truly a classic of our tragic era. Fritiof Nilsson Piraten has enriched the field of short stories with a magnificent collection called *Historier fraan Fars* (Tales from Fars). Fredrik Böök traces the making of a man back to the conditioning he received in school; his book is called *Storskolan* (The Big Class). A towering contribution to the understanding of the greatest conflict of modern times is Harry Martinson's *Verklighet till Döds* (Realism unto Death). Martinson hates the clichés of life, the ready-made pattern handed to millions by dictatorial decree. To him might never will be right. In *Josefine Eller Säg Det Med Blommor* (Josephine—or, Say it with Flowers), Olle Hedberg ably cuts a slice from the so-called solid middle-class and presents it slightly spiced to the reader; it is the story of a spinster who gets in trouble with her snooty relatives. Erik Hornborg has written the history of Sweden, *Sveriges Historia*, from the earliest days of the kingdom down to the present. "Sweden," says Hornborg, "has built itself a fine house, it has much to defend."

**SCHOOL LUNCH PROGRAM.** See SURPLUS MARKETING ADMINISTRATION.

**SCHOOLS.** The U S Office of Education estimated that 32,285,000 pupils were enrolled in schools of all types in the United States for the school year 1940-41. The enrollments were distributed as follows:

Elementary	21,550,000
Secondary	7,160,000
Higher	1,425,000
Nurse-training	75,000
Business colleges	75,000
Subtotal	(30,285,000)
Evening and part-time schools	1,950,000
Miscellaneous schools, trade, etc	50,000
Grand Total	32,285,000

Private schools accounted for 2,225,000 pupils of the total elementary enrollment and 510,000 of the total secondary enrollment (four years of high school). Forty thousand of the 680,000 kindergarten pupils were enrolled in private kindergartens. Entering the first grade for the first time were 2,100,000 pupils—200,000 in private schools and 1,900,000 in public schools. The estimated number of graduates for both public and private schools

was as follows: Eighth grade, 1,900,000; high school, 1,250,000; college, 177,000.

Teachers in elementary schools totaled 725,000 for the school year (650,000 in public schools and 75,000 in private schools); high school teachers numbered 315,000 (280,000 public and 35,000 private). There were 122,000 one-teacher schools having an estimated 2,680,000 pupils. The number of pupils to be transported at public expense was 4,500,000.

Latest information on school expenditures for the country as a whole apply to the school year 1937-38 and are shown in the accompanying table. Later information by States appears in the section on *Education* in the articles on the States. See also EDUCATION; EDUCATION, OFFICE OF; UNIVERSITIES AND COLLEGES. For school buildings, see ARCHITECTURE. For foreign statistics, see the articles on the various countries.

**SCIENCES, National Academy of.** See ACADEMY OF SCIENCES.

**SCOTLAND.** See GREAT BRITAIN under *Area and Population*.

**SCOTTSBORO CASE.** See ALABAMA.

**SCULPTURE.** Not many monumental works in sculpture were executed in 1940, but general activity in the field seemed to increase and a greater variety in materials used was observed,—wood and stone taking precedence over bronze and marble. See ART.

Sculpture in glass, made in Sweden and in the United States, attracted wide attention, finding favor with connoisseurs of art, art museum directors, and sculptors of outstanding reputation. Carl Milles did work for the Orrefors Glass Company in this medium, and twenty-seven world-renowned sculptors of this and other countries co-operated in like manner with the Corning Glass Company in the production of sculpture in Steuben Glass.

Sculpture in pottery was also seen to advance in popularity. In fact in 1940 it found its way into almost all the leading exhibitions. Especially notable was the representation in the Syracuse Museum's Ceramic Exhibition, in which sculpture in this medium carried off three prizes and three honorable mentions. The prize and honor winners were residents of California, Ohio, and Connecticut, indicating the widespread interest in this art.

In order to increase interest in sculpture and get more examples of the work of American sculptors in American homes, an organization was formed to issue reductions of such in "Limited Editions" which might be purchased at small cost. The materials used were imitation stone, concrete, and lead;

#### EXPENDITURES FOR SCHOOLS REPORTING, 1937-38

[Includes capital outlay]

Type of school	Public	Private	Total
Elementary schools (including kindergartens) <sup>a</sup>	\$1,333,376,527	\$151,288,688	\$1,484,665,215
High schools and academies	899,733,527	64,564,177	964,297,704
Universities, colleges, and professional schools (including preparatory departments) <sup>b</sup>	279,832,761	265,824,539	545,657,300
Schools for delinquents <sup>c</sup>	2,103,052	224,326	2,327,378
Schools for the deaf <sup>c</sup>	870,190	1,992,321	2,862,511
Schools for the blind <sup>c</sup>	1,020,706	352,218	1,372,924
Schools for the mentally deficient <sup>c</sup>	3,683,919	283,318	3,967,237
Government schools for Indians <sup>c</sup> . . .	8,923,814		8,923,814
Total . . .	2,529,544,496	484,529,587	3,014,074,083

<sup>a</sup> Estimated.

<sup>b</sup> Does not include \$51,475,945 public, \$87,717,562 private, and \$139,193,507 total expenditures for auxiliary enterprises and activities and for other noneducational expenditures.

<sup>c</sup> 1936 data for State and private residential schools; city public schools not included.

<sup>d</sup> Includes expenditures for instructional purposes and capital outlay for schools reporting these items.

<sup>e</sup> Not including amount spent for tuition in public schools—\$650,712.

prices ranged from five to two hundred fifty dollars. The guarantors paid first costs of casting.

Two medals were struck and distributed by the Society of Medalists to its members in 1940. They were by Edmond Amateis and Walker Hancock, both setting forth timely and thought-provoking themes. An equestrian statue in bronze, representing Theodore Roosevelt as explorer, the work of James Earle Fraser, was erected in New York City on a site adjacent to the Museum of Natural History. A bronze portrait bust of Ernest Schelling by Malvina Hoffman was presented by friends of the musician to, and permanently placed in Carnegie Music Hall, New York. The Jefferson nickel, designed by Felix Schlag of Chicago, was minted and put in circulation in 1940.

Under a Commission, specially appointed by Congress, a competition was held for a statue of Thomas Jefferson to be placed under the dome in the Jefferson Memorial, in process of erection in Washington, D. C. One hundred one sculptors competed, from whom six were selected to restudy and resubmit their models. One of these was in turn chosen to make further submission and upon his failure to meet requirements, two of the other competitors were given like opportunity. Up to the close of the year none had been successful in satisfying the Commissioners.

Three sculpture competitions were conducted by the Federal Government through its Section of Fine Arts during 1940 with the purpose of obtaining sculpture for the decoration of new Federal buildings. Five hundred seventy-three sculptors competed, making one thousand ninety entries. One of these competitions was for two eight-foot statues to be placed on either side of the auditorium of the new Social Security Building at Washington, and was won by Robert M. Cronbach of New York. Another was for three attached sculptures in the round to go over the three entrances to the new War Department Building and was won by Henry Kreis of Connecticut.

Two alabaster statuettes of mourners from the tomb of Philip the Bold and his son, John the Fearless, in a monastery near Dijon which was destroyed in the French Revolution, were purchased by the Cleveland Art Museum from the Clarence Mackay estate; also statues of two Gothic Kings, Clovis and Clothar, carved in stone, standing for many, many years on pedestals on either side of a doorway of the famous French abbey of Moutiers-Saint-Jean, but likewise victims of the Revolution which swept all France, were restored to their original setting, now incorporated in the Cloisters, New York, through the acquisition and gift of Mr. John D. Rockefeller, Jr.

Epstein's statue of Adam, a bestial monster in pink alabaster weighing three tons, was brought to this country in the spring of 1940 and exhibited in New York for a few weeks, an admission fee was charged, but so little interest was shown that its proposed tour of the States was apparently abandoned. The sculptor himself protested against the showing.

LEILA MECHLIN.

**SECOND INTERNATIONAL.** See SOCIALISM.

**SECRET SERVICE, U.S.** The U.S. Secret Service, a division of the Treasury Department, is one of the oldest Federal law-enforcement agencies. It was established during the Civil War and has as its chief duties the protection of the President of the United States, his family, and the Pres-

ident-elect; the policing of the White House and its grounds; the suppression of the counterfeiting and alteration of all Government obligations, and the protection of Treasury buildings, money, and securities.

"Know Your Money" became the keynote of an intensive educational campaign of education against crime, inaugurated by the Secret Service in January, 1940, to teach the Nation the difference between genuine and counterfeit currency, and to remove from the youth of the country the temptation to engage in criminal careers through the so-called "easy money" counterfeiting route. Educational motion pictures were shown to more than 4,500,000 persons, and approximately 6,000,000 educational pamphlets were distributed by Secret Service personnel.

That the campaign has been effective is clearly evident. During the fiscal year the Secret Service made 3281 arrests, or 704 fewer than in the previous year. These included makers and passers of counterfeit notes and coins, forgers of Government checks, violators of the Gold Reserve Act and the Federal Farm Loan Act, and others who stole Government property, presented false claims or committed miscellaneous offenses over which the Secret Service has jurisdiction.

Counterfeit and altered notes representing \$237,-335 were seized by or surrendered to the Secret Service, constituting a reduction of \$186,759, or 44.03 per cent, as compared to 1939. The total loss to the public through acceptance of counterfeit notes and coins amounted to \$197,381, as compared to losses of \$344,382 in 1939. This reduction of \$147,001 is a distinct dividend of the "Know Your Money" campaign.

In cases brought to trial, 3005 persons were convicted and 89 were acquitted. The convictions represent 97.1 per cent of the cases brought to trial, a slight increase over the 1939 high of 97 per cent.

During the year Congress enacted legislation to permit the appointment of 20 additional men to the White House Police Force, which now consists of 80 well-trained officers who guard the Executive Mansion and its grounds, under the direction of Frank J. Wilson, Chief of the Secret Service.

FRANK J. WILSON.

**SECURITIES AND EXCHANGE COMMISSION.** See BUSINESS REVIEW, ELECTRIC LIGHT AND POWER; FINANCIAL REVIEW under *Financial Regulation*.

**SECURITY MARKETS.** See FINANCIAL REVIEW.

**SEISMOLOGY.** During the year Landsberg published a summary of the seismological stations of the world which brings out in a striking manner their unequal distribution and the need of more observatories. Landsberg lists 478 stations which is an approximate average of one station per one million square kilometers of the earth's surface. The present distribution by continents is as follows: Europe has 159 observatories or 14 per million square kilometers, Asia 156 or 3.7 per million square kilometers, North and South America 110 or 2.7 per million, Australia and New Zealand 22 or 2.6 per million, Africa 9 or 0.3 per million. Countries with the largest number of observatories are Japan with 127, United States with 59, and Italy with 39. Countries with the greatest density of stations are Japan with 322 per million square kilometers, Switzerland with 145 and Italy with 126. It is to be specially noted that Japan has nearly

all the observatories in the continent of Asia and that the United States has more than half of the observatories in the two American continents. See EARTHQUAKES.

**SEWERAGE AND SEWAGE TREATMENT.** The Southwest activated-sludge plant of the Chicago Sanitary District, the largest sewage treatment plant of its type if not of any type in the world, is being enlarged from a capacity of 500 million gallons today to an ultimate 900 million gallons. A suit brought against the district for infringement of activated-sludge patents was decided in favor of the patentees some time ago, but is pending on appeal. The latest patent involved in the suit expired Nov. 25, 1935. During the year the Milwaukee Sewerage Commission finished paying \$818,000 royalties for the use of the activated-sludge process. Up to 1936, a total of \$635,000 royalties had been paid by a hundred municipalities.

Cities that completed sewage treatment works or had them under construction in 1940 included Springfield, Mass.; New Haven, Conn.; New York (several plants); Gary, Ind.; Chicago (already mentioned); Rock Island, Ill.; South St. Paul, Minn., to serve the city, stockyards, and packing plants. Large sewage collection or disposal projects in the planning stage include Boston, sewage treatment works at Nut Island, to serve the South Metropolitan District; extension of North Metropolitan District relief sewer from East Boston to Deer Island, the whole estimated to cost \$15,000,000; Philadelphia, extensive sewage treatment works, financing method in abeyance since State Supreme Court held \$42,000,000 bond issue proposal unconstitutional; Louisville, \$4,100,000 for Ohio River intercepting sewer and \$1,600,000 for sewage treatment works; Los Angeles, relief and trunk sewers, additional sewage treatment works and ocean outfall, \$32,000,000; Toronto, Ont., first stage of activated-sludge plant, \$6,000,000; U.S. War Department, sewage disposal works for National Defense projects

**SHIPBUILDING.** Both merchant and warship building in the United States during 1940 has been very active, in fact several private and Federal yards have been operating at peak capacity. The large number of orders that have been placed can be laid directly to the war in Europe and to

the necessity for the United States to be prepared for any situation which might arise.

With the seizing by Germany of Norway, Denmark, Holland, Belgium, and France accurate accounts of shipbuilding in these countries are not available. War pressure has doubtless caused German yards to devote most of their time to the building of submarines and small fast torpedo boats, the former for destroying merchant and warships and the latter for harassing convoys of merchant ships. From reports of the proposed invasion of England, Germany is believed to have built a large number of barges for carrying soldiers and war equipment. Italy, it may be assumed, because of her lack of iron, steel, coal, and oil has built only a few ships, and these perhaps submarines and small craft. France since being overrun by Germany has practically ceased to be a shipping and shipbuilding nation. Late in December, 1940, the British government awarded an order for 60 cargo vessels to yards in the United States.

Many cargo, and cargo and passenger vessels built in 1940 for the account of the U.S. Maritime Commission have been so designed that they can be changed into auxiliaries for the Navy, or transports for the Army. During the year notable advances were made in improved construction which has given increased carrying capacity, safety, and speed. Welded ships are no longer a novelty, nor is the use of low alloy steels, for ships of welded alloy steel are lighter, stronger, and have a greater carrying capacity than equivalent ones of carbon steel. Improvements have been made in marine Diesel engines, boilers, turbines, and auxiliaries, resulting in improved operating economy. (See POWER PLANTS.) Safety in ship design and construction has been given much study by Federal agencies. These studies include, better subdivision of the hull into compartments, improved radio equipment, use on the weather deck of steel hatch covers instead of wood, together with advanced designs and the selecting of materials that tend to prevent and stop fires. For vessels built for the Maritime Commission, Senate Report No. 184 is followed; a vessel being divided by vertical fire-resisting bulkheads so, should fire break out, practically all that can burn is the particular product.

The Maritime Commission (see also SHIPPING) has continued to be an important Federal agency in shipbuilding and shipping. For it not only has the authority to place contracts with shipyards, but also to allocate the ships built to different operators. Of the ships built under the supervision of the Maritime Commission since it was established by the Merchant Marine Act of 1936, to Dec. 1, 1940, contracts have been awarded for 179, of which 49 have been delivered. The following table gives data on different types.

Type	Displacement tons	Designed for
C-1 cargo . . . . .	12,875	Efficient handling of small cargoes
C-2 cargo . . . . .	13,900	Economical operation.
C-3 cargo . . . . .	17,600	Fast freight
C-3 cargo & passenger	17,600	For Pacific ocean service.
Cargo-passenger . . . .	14,210	For South American trade.
Cargo . . . . .	14,450	Fast freight.
Cargo . . . . .	15,200	Cargo.
Tankers . . . . .	23,320	High speed, large capacity.
Passenger	35,400	Luxury liners, for service on the Atlantic and to the Orient

Several of the cargo ships have accommodations for eight or more passengers; others have defense features making them adaptable for war service.

Some of the tankers have twin screws giving a speed of 19 knots.

The largest and finest merchant ship completed in 1940, was the trans-Atlantic liner *America* built for the United States Lines by the Newport News Shipbuilding Co. She has a striking general appearance, and her interior design, passenger accommodations, and appointments are second to no foreign-built liner. Among the engineering features are elaborate fire detecting and extinguishing systems, automatic fire-protection doors in fire-screen bulkheads, and the largest air-conditioning plant installed to date on a merchant ship. General dimensions: length overall 723 ft.; beam molded 93 ft. 3 ins.; draft loaded 32 ft. 8 ins.; displacement loaded 35,400 tons; accommodations for 543 cabin passengers, 418 tourist, 241 third class, crew 643. Propelling machinery consists of six water-tube boilers furnishing steam to turbines that drive the propellers through reduction gears. On official trials a speed of 25.3 knots was obtained.

Another outstanding passenger vessel designed for around the world service was completed in October, 1940. This vessel, the *President Jackson*, is one of six C-3 Maritime Commission passenger and cargo liners built for the American President Lines. All are of fireproof construction throughout, with the passenger quarters amidships. The public rooms, hall, recreation space, and state-rooms are attractively decorated, and are located on the promenade deck, while below are the dining room, galley, and pantry. General dimensions: length overall 492 ft.; beam molded 69 ft. 6 ins.; draft loaded 26 ft. 6 ins.; displacement 16,190 tons; passengers 97; crew 135; driven by turbines at a speed of 16½ knots. A sister ship, the *President Monroe*, was completed in December, 1940. Somewhat similar to the *President Jackson* is the *Sea Fox*, delivered in March, 1940, to the Moore & McCormack Lines, but the *Sea Fox* was not built for passenger service and had accommodations for only twelve passengers.

Other ships have been put in service for carrying passengers and freight. Of these is the *Del-brasil*, completed in May, 1940, embodying the latest requirements of various Federal agencies and incorporating features recommended by the Navy Department to facilitate conversion to a naval auxiliary in time of war. The passenger quarters are amidships, and the arrangement, decorations, comfort, and convenience compare favorably with many pre-war trans-Atlantic liners. General dimensions: length overall 492 ft.; beam molded 65 ft. 6 ins.; draft loaded 25 ft. 6 ins.; displacement 14,210 tons; passengers 67; crew 78; speed loaded 16½ knots.

The ships mentioned above are steam turbine driven but several cargo motorships were also completed. Representative of these is the *Sea Witch* of the American Pioneer Line, built primarily for carrying cargo. She is of the Maritime Commission C-2 type, length overall 459 ft., beam molded 63 ft., draft loaded 25 ft. 10 ins., displacement 13,900 tons. Main propelling machinery consists of two 3000 hp direct reversible Diesel engines. Service speed 15½ knots.

The importance of oil in modern warfare is well shown in the present European war. To meet war and commercial needs, several large tankers have been built in the United States. One of the largest, the *Ohio*, was turned over by the builders to the Texas Co. in June, 1940. The *Ohio* is 513 ft. 10 ins. overall, beam molded 68 ft., turbine driven,

speed 16 knots, and can carry about 100,000 bbl. of oil.

Of the unique ships built in the past year is the *Seatrain Texas*, operated by Seatrain Lines, a line engaged in carrying completely loaded freight cars from New York to Cuba. Other interesting vessels are: the electric ferry boat *E. G. Diefenback*; United States lighthouse tender *Junsper*; survey ship *Explorer* of the U.S. Coast & Geodetic Survey, and the Diesel engine towboat *Twin Cities*, built for towing oil barges from St. Paul, Minn. to St. Louis, Mo. A rather exceptional vessel under construction at Manitowoc, Wis. is a large car ferry (*City of Midland*), 406 ft. long, designed to carry 34 freight cars, 50 automobiles, and 376 passengers. The *City of Midland* will be put in service early in 1941 on a 65 mile run from Ludington, Mich. across Lake Michigan.

According to the American Bureau of Shipping Bulletin covering shipbuilding activities of 1940 to December 1st, including Maritime Commission and private companies in the United States, 314 vessels aggregating 1,591,540 gross tons were under construction or contracted for. Of these, 96 were cargo vessels totaling 708,880 tons, 23 passenger-cargo of 211,400, 64 tankers of 601,400, the remaining tonnage consisting of tugs, ferries, and barges.

CHAS. H. HUGHES.

**SHIPPING.** The war in Europe, and the treaty of Japan with Germany and Italy, with its implied warnings to the United States and the Soviet Union, still further disrupted all former shipping routes. Overseas operation of German and Italian merchant ships with North and South America, Africa, Japan, and the Far East were practically stopped by the British blockade. Passenger and cargo vessels flying the flags of Germany, Italy, Norway, Denmark, Belgium, Holland, and France were unable to reach their home ports and were tied up in neutral countries. Of the well known trans-Atlantic liners not willing to leave the United States for fear of seizure by the British is the *Normandie* of the French Line, besides several Italian, Belgian, Dutch, French, and German cargo vessels.

Sailings of United States' vessels to Europe were curtailed by the U.S. Neutrality Act and further phases of the war. Lines previously operating to Europe diverted their ships to safer routes, and to excursions from New York and North Atlantic ports to West Indies, Bermuda, Caribbean Sea, and, via the Panama Canal, to Pacific coast ports. Among the popular excursion ships were the *America*, *Manhattan*, and *Washington* of the United States Lines. The *America* is the largest passenger vessel ever built in the United States.

Shipping losses by England, Germany, Italy, France, and other countries from submarines, mines, and aircraft are difficult to determine, for reports published by the countries at war differ widely. Some German raiders were able to get free in the Atlantic and Pacific oceans to destroy ships, but German merchant vessels attempting to leave neutral ports were seized by the British. Despite convoys protected by warships and aircraft, British losses continued through the last months of 1940 at a serious rate. (See also EUROPEAN WAR.) Among the large well known passenger vessels sunk in 1940 by submarines, mines, or bombs are those listed in the next column.

Shipping on the Great Lakes was very active.

Name	Tons	When sunk in 1940
<i>President Harding</i> . .	14,000	May
<i>Oryma</i> . . . . .	20,000	June
<i>Caladonia</i> . . . . .	17,000	"
<i>Lancastria</i> . . . . .	16,000	"
<i>Carinthia</i> . . . . .	20,000	"
<i>Champlain</i> . . . . .	28,000	July
<i>Arandora Star</i> . . . . .	15,000	"
<i>Transylvania</i> . . . . .	17,000	August
<i>Volendam</i> . . . . .	15,000	"
<i>Empress of Britain</i> . . . . .	42,000	October
<i>Laurentic</i> . . . . .	19,000	November
<i>Oslofjord</i> . . . . .	18,000	December

The movement of ore in bulk freighters was estimated as between 62,500,000 and 63,500,000 tons at the close of navigation. At Sault Ste. Marie officials considered the traffic during 1940 to be 50 per cent higher than in 1939. During the season more than 20,000 vessels passed through the Detroit River. Shipments of iron and other ores, coal, and steel through the Welland Canal was heavy, and showed an increase of about 1,000,000 tons over 1939. The Canadian ports of Owen Sound, Hamilton, and Port Arthur had a busy year. Shipments from Lake Ontario eastward into the St. Lawrence River were the highest for several years, while those from Montreal and other ports on the St. Lawrence to England were exceptionally heavy.

See COAST GUARD; EUROPEAN WAR; INSURANCE; NEUTRALITY; SHIPBUILDING.

**Maritime Commission.** Established under the Merchant Marine Act of 1936, this Commission is an important Federal agency in shipbuilding and shipping. In shipping, it passes on charters of United States' vessels to engage in foreign trade; its consent must be secured before a vessel is sold, it approves or disapproves of foreign trade routes, and, furthermore, contracts for the building of ships and allocates them to operators. From information obtainable, the list of companies operating vessels under the general supervision of the Maritime Commission in 1940 was as follows:

Companies	Routes
American Mail Line	Puget Sound ports to Japan, China, and Philippine Islands.
American Pioneer Line	Far east service, U.S. Atlantic ports via The Panama Canal to Philippine Islands, China, and Japan.
	Australia service, U.S. Atlantic ports via The Panama Canal to Australia and New Zealand.
American Republics Line	Passenger and freight service from New York to Rio de Janeiro, Santos, Montevideo, and Buenos Aires
	Freight, U.S. North and South Atlantic ports to Brazil and River Plate
Grace Line	U.S. North Atlantic to West Coast South America
	U.S. Pacific Coast ports to West Coast South America
Orion Lines	U.S. North Atlantic to Spanish ports.
N.Y. & Cuba Mail	U.S. North Atlantic to Mexican ports
Pacific Republics Line	U.S. West Coast ports to East Coast South America.

The Commission's approval was given to a \$20,000,000 program for nine new ships for an expanded Pacific Northwest-Orient run of the American Mail Line. The first of the new vessels is scheduled for delivery to the line in January, 1941; all of the nine will be in service by 1942, replacing the six older ones now being used. The

importance of the Maritime Commission's building program is shown by the fact that the Navy Department took over for its own use seven large high speed tankers, and three C-2 and two C-3 cargo vessels. The Army, for troop transports, has obtained several ships previously owned or operated by the Commission.

**Maritime Labor Board.** The activities of the Maritime Labor Board are of much interest to shipping men. On Mar. 1, 1940, the Board submitted to the President and Congress its report on a permanent Federal policy for the amicable adjustment of all disputes between maritime employers and employees, and for the stabilization of maritime labor relations.

The Board assembled, studied, and analyzed available data bearing upon labor relations in the maritime industry. From such studies, plus experience with the administration of Title X of the Merchant Marine Act of 1936, the Board concluded that the present declared policy of the United States with respect to labor relations in waterborne commerce, as embodied in Section 1001 of Title X, should be continued. The experience of the Board pointed clearly to the need of amending certain provisions of Title X in order to make it more effective as a means of encouraging the practice and procedure of collective bargaining in the maritime industry.

The recommendations of the Board fall into two main categories: (1) specific amendments to Title X regarding measures necessary to strengthen existing facilities for making and maintaining collective agreements, and for the amicable adjustment of disputes; and (2) a general recommendation intended to encourage the development of collective bargaining in the maritime industry by removing existing impediments to its growth.

CHAS. H. HUGHES.

**SHOCK TREATMENTS.** See MEDICINE AND SURGERY; PSYCHIATRY

**SHOE INDUSTRY.** World Events had a disturbing influence on markets, production, and operation of the shoe and leather industries in 1940. Thus far, for the United States at least, the shoe industry has retained a good sense of balance, but the whole continent of Europe has been lifted completely out of the economic structure of the world by the blockades and shoe production for a war rather than a peace economy. World trade in shoes has been impeded or blocked. In Europe shoe production for war use is first, for regulated civilian demand second. In the United States civilian demands are still paramount, but military requirements are noticed; 6,000,000 pairs of shoes were ordered for United States army, navy, and CCC use in 1940—a sharp increase over the yearly average governmental purchase of 1,600,000 pairs between 1937-39. The shoe industry has handled all government orders without "bottle-necks."

Leather footwear production in the United States lagged behind 1939, with a total of approximately 398,065,000 pairs for the year as compared to 424,136,000 in 1939 (a peak year). But production of fabric and part fabric footwear increased 26.6 and 25.4 per cent over 1939's figures of 5 and 7 million pairs respectively.

Rubber footwear (rubbers, overshoes, sandals) reported peak production in 1940. War demands, restrictions on international trade, development of national self-sufficiency have all contributed to world-wide development of cheap rubber footwear, with footwear manufactured with moulded rubber soles showing a large increase in 1940. Usage of rubber footwear has increased greatly in China, India, Africa, and South America, drawing on nearby supplies of rubber and displacing imported leather.

The decade 1930 to 1940 showed many technical developments in the shoe industry: new lasts, new processes, new materials, unlined shoes, elasticized shoes, and now plastic shoes—the softy, the wedge, the casual group. The United States now produces shoes comparable with the world's finest. Wholesale prices were steady at the close of 1940, new novelty styles at a minimum. See LEATHER.

JOHN F. W. ANDERSON.

**SHOOTING.** Rifle and Pistol. High marks were the exception rather than the regular thing in shooting contests during 1940, and the winners of the various events at the national tournament at Camp Perry, O., were almost consistently less accurate than the champions of other years.

Because of field maneuvers of Regular Army and reserve units, the national matches were postponed, and the change of date not only reduced the number of competitors but made it impossible for many of the top-notchers to attend.

The scores were consistently low in almost every one of the major events. At the Wimbledon Cup match, the score was 100-24 as against 100-27 in 1939. At the President's match, the 1940 score of 146 was one point below that of the previous year. The small-bore championship was awarded to the man with a score of 3187, where the winner in 1939 rolled up 3192 points. The Dewar team amassed only 7898 points, as compared with 7954 in 1939.

In capturing the national pistol title, Harry Reeves made a score that was 10 points under last year's mark. However, in the national pistol team event, the United States infantry team boosted the score to 1343 points as against a championship total of 1315 in 1939. Individual members of the Detroit Police Department made some excellent scores, but the team was not impressive as a whole.

**Skeet.** In the national tournament at the Onondago Skeet Club Field, Syracuse, N.Y., Richard Shaughnessy of Dedham, Mass., was the undisputed ruler of the realm. He strolled off with the national all-gauge and the national small-gauge crowns, and still unsatisfied he afterward dropped in at Lordship and captured the North American titles in the all-bore contest, emerging with 12-gauge, 20-gauge, and .410-gauge honors.

Miss Patricia Laursen of Akron, O., was supreme in the feminine division. She made a perfect 100 straight to win the woman's crown.

**Trapshooting.** E. H. Wolfe of Charleston, W.Va., won the Grand American championship which was held at Vandalia, O. He exhibited remarkable proficiency in the face of disconcerting gales that swept over the traps throughout the match. Mrs. Lela Hall of Strasburg, Mo., once

UNITED STATES PRODUCTION & CONSUMPTION OF LEATHER SHOES IN 1940 (000 OMITTED)

	Women's	Men's	Misses & Children's	Youths' & Boys'	Infants'	All Other	Total
Production . . .	165,877	101,845	39,799	14,801	21,723	54,020	398,065
Consumption . . .	175,329	102,418	41,654	15,780	22,905	54,213	412,299

more carried off the women's honors. She broke 95 out of 100 birds from the 22-yard line, which is a sensational record in any sex.

**SHORE AND BEACH PROTECTION.** See GEOLOGY.

**SIAM.** See THAILAND.

**SIDI BARRANI.** See EUROPEAN WAR under *British Victories in Africa*.

**SIERRA LEONE.** A British West African colony and protectorate. Total area, 27,925 square miles, of which the parts administered as colony (Sierra Leone peninsula, the Tasso, Banana, and York islands, and the town of Bonthe on Sherbro island) equaled 256 square miles. Total population (1931 census), 1,768,480, including 96,422 in the colony. Capital, Freetown (63,572 inhabitants in 1938).

**Production and Trade.** Chief products: kola nuts, palm kernels, ginger, rice, groundnuts, piassava, cassava, hides, diamonds, gold, iron ore, platinum, and chromite. Trade (1938): imports, £1,500,342; exports, including re-exports, £2,388,929 of which diamonds accounted for £858,055, iron ore £646,421, palm kernels £457,031, gold £207,940, ginger £60,680. Shipping entered during 1938 aggregated 2,712,979 tons.

**Government.** Finance (1939): revenue, £1,131,357; expenditure, £1,165,062; public debt (Dec. 31, 1938), £1,288,259. The colony and protectorate are administered by a governor, assisted by an executive council. There is a legislative council of 23 members (including the governor as president) which legislates for both the colony and the protectorate. Governor and Commander-in-Chief, Sir Douglas Jardine (appointed May 21, 1940).

**History.** The diversion of British merchant shipping around the Cape of Good Hope following Italy's entrance into the European War and the extension of hostilities to the near-by French colonies greatly increased the commercial and strategic importance of the Freetown harbor and naval base during the latter half of 1940. The colony's military defenses were strengthened. In mid-year the Governor was authorized to enroll all males between the ages of 18 and 45 in the Defense Reserve force.

The colony was hard hit by lower prices for its export products caused by the war. However, substantial progress was reported in social and economic matters. A law authorizing and regulating trade unions went into effect January 1. A workmen's compensation bill was adopted by the Legislative Council. In the Sierra Leone Protectorate, the system of native administration introduced from Nigeria on an experimental basis was extended at the request of the native chiefs. A slum clearance scheme for the poorer sections of Freetown was initiated through a commission appointed by the Governor.

**SILK.** See TEXTILES.

**SILK SCREEN PROCESS.** See PRINTS.

**SILVER.** With minor fluctuations in May and June, the price of silver was stable at 34.75¢ per fine oz., New York. This was slightly lower than in 1939 when the price ranged from 42.75¢ to 34.75 and averaged 39.082¢. Newly mined domestic silver was purchased by the Government at 70%¢ per oz.

In London the price rose slightly during the year from 21.892 pence per oz. in January to 23.015 in December, with an average for the year of 22.281 compared with 20.57 pence in 1939. The world silver market was again dominated by the purchase policy of the U.S. Treasury. Mexico was the principal beneficiary of this policy and sold silver to

the United States at the rate of about \$3,000,000 a month. Strong efforts were made in the U.S. Senate to repeal that part of the Silver Purchase Act relating to foreign silver, but the opposition to the measure was unable to marshal a majority vote. Despite continued buying by the Treasury, the goal of a 75-25 gold-silver ratio in the metal backing of the currency receded still further from attainment. The Treasury still lacked more than 2 billion oz. of reaching the legal ratio.

The American Silver Producers Research Project for extending the uses of silver in industry completed a three-year program with headquarters at the Bureau of Standards at Washington, and transferred its activities to the plant of Handy and Harman at Bridgeport, Conn. The future work of the project will be confined to commercializing the uses of silver explored since 1937.

The value of United States silver production in 1940 exceeded that of any previous year, under the administration's silver buying program. The production of 71,688,150 oz., valued at \$50,977,440 compares with the 1939 production of 65,119,513 oz. valued at \$44,202,279. The production in 1915 was 74,961,075 oz. but the value was only \$37,397,300.

World silver production in 1940 was estimated at 278,000,000 oz., compared with 264,200,000 oz. in 1939, according to Handy & Harman. Gains in consumption of silver occurred in sterling silverware, jewelry, and in the industrial field. The arts and industry of the United States and Canada used 41,000,000 oz. of silver in 1940.

H. C. PARMELEE.

**SINGAPORE.** See BRITISH MALAYA.

**SINKIANG.** See CHINA under *Area and Population*.

**SIRUP.** See SUGAR.

**SIXTH COLUMN.** See FIFTH COLUMN.

**SKATING.** Speed. Principal honors in the 1940 world of speed skating went to Miss Madeline (Maddy) Horn of Beaver Dam, Wis., and Leo Freisinger of Chicago. The former successfully defended the women's senior North American and national outdoor titles, at LaCrosse, Wis., and Schenectady, N.Y., respectively.

Freisinger replaced Charles Leighton and Kenneth Bartholomew, both of Minneapolis, as North American and national ruler.

**Figure.** Four ice revues were staged at Madison Square Garden during the 1939-40 season. They were the Ice Follies, Miss Sonja Henie's Hollywood Ice Revue, the European Ice Revue, and the yearly charity carnival of the Skating Club of New York. Approximately 250,000 persons were attracted to the spectacles.

At the national amateur championships in Cleveland, O., Gene Turner, 19 years old of Los Angeles, Calif., was crowned champion. His nearest rival was Ollie Haupt, Jr., of St. Louis, Mo. Turner succeeded Robin Lee of St. Paul, Minn., who deserted the amateur ranks to become a professional instructor.

The women's national title was won for the third successive year by Miss Joan Tozzer, with Miss Hedy Stenut, former European star, now of Rochester, N.Y., finishing second. With Bernard Fox of Boston, Mass., as her partner, Miss Tozzer also shared in the pair championship. The national fours title was captured by Miss Jannette Ahrens, Miss Mary Louise Premer, Robert Uppgren, and Lyman E. Wakefield, Jr., of the St. Paul Figure Skating Club.

**SKIING.** The tremendous interest in skiing as

one of America's foremost winter sports assumed unparalleled proportions during 1940. The number of persons who took up the game as a purely recreational adventure was somewhere in the hundreds of thousands. More and more Norwegian rules and terminology were introduced into the American variety of the sport, notably the slalom or flag turn regulation designed to make the runs safer by interposing turns and breaks.

Outstanding competitive events of the season drew more than 4000 entrants. The national jumping championship among the Class A skiers was captured by Alf Engen of Sun Valley, Calif.; the collegiate title was awarded to Eddie Gignac of Middlebury College. In the international jump at Brattleboro, Vt., first honors were taken by Toger Tokle, the young Norwegian. At Sun Valley, Dick Durrance was the pre-eminent amateur in downhill and slalom racing. Among women skiers, Miss Nancy Reynolds of Montclair, N.J., and Mrs. Grace Carter Lindley of Minneapolis were outstanding performers. Miss Marilyn Shaw of Stowe, Vt., a high school girl, captured the women's national open and closed combined downhill and slalom titles.

**SLOAN FOUNDATION.** See **BENEFAC-TIONS.**

**SLOVAKIA.** A former province of the Czecho-Slovak republic, proclaimed an independent republic by the provincial parliament on Mar. 14, 1939, and taken under German protection by a treaty signed Mar. 18, 1939. Capital, Bratislava (Lemberg). See **CZECHO-SLOVAKIA**.

**Area, Population, etc.** Exclusive of territories ceded to Hungary and including areas transferred to the republic by Germany from Poland, Slovakia has an area of approximately 14,390 square miles and a population of 2,414,163 (1939 estimate). There are nearly 2,000,000 Slovaks, about 100,000 Germans, 180,000 Jews, 80,000 Hungarians, and 20,000 Ruthenians (Ukrainians). The population of Bratislava, capital and chief city, was 170,668 (estimated) in 1935. Roman Catholicism is the predominant religion.

Agriculture and forestry are chief sources of livelihood. Industry, mining, and commerce are of secondary importance. Production of wheat in 1939 was 321,600 metric tons; rye, 200,800 metric tons. Barley, oats, sugar-beets, and corn are other leading crops. Lead and copper are the principal minerals.

**Government.** The Slovak People's party, led by Josef Tiso, a Roman Catholic priest, adopted fascism of the Nazi variety as its ruling principle and imposed it upon Slovakia when the province obtained regional autonomy within the Czecho-Slovak republic in November, 1938 (see 1938 **YEAR BOOK**, p. 201). Following the declaration of independence and the acceptance of German protection, a new constitution making Slovakia an authoritarian "Christian National Republic" was adopted by the one-party parliament on June 21, 1939. The Constitution provided for a parliament of 80 members elected by the people for five years from a one-party list; a President elected by Parliament; and a National Council of 22 members exercising wide executive and legislative powers through its chairman, acting as Premier.

The National Council is composed of 6 representatives appointed by the President, 10 of the Slovak People's party, and 6 of the corporative civil service, labor, and commerce organizations. The Premier has power to summon or dismiss Parliament at his discretion, veto any of its measures,

and with the approval of the National Council legislate by decree without ratification by Parliament. President in 1940, Josef Tiso (elected Oct. 26, 1939); Premier, Bela Tuka. The Constitution recognized the Slovak National party (successor to the Slovak People's party) as the sole legal political party. Minority rights and religious liberty was granted to all Slovak citizens. The former national minority parties were given the status of subdivisions of the Slovak National party.

Under the Slovak-German treaty of Mar. 18, 1939, Slovakia agreed to permit German military occupation of its frontier districts along the Polish border, to "organize its own military forces in close collaboration with the German armed force," and to "conduct its policy in close collaboration with the German Government." A German-Slovak military agreement ratified Aug. 18, 1939, placed the Slovak military forces under German command and authorized German military occupation of the entire country (see 1939 **YEAR BOOK**, p. 182 f.). For 1940 developments, see *History*.

**History.** The difficulties that harassed the new Slovak state during 1939 increased throughout the following year. The republic fell more and more under German control. Its army was reorganized in January and many German officers were reported to have been placed in Slovak regiments. The gearing of the Slovak economy into that of the Reich had further adverse results. Large-scale exportation of foodstuffs to Germany and the cutting off of former trade relations with Bohemia and Moravia and other Central European countries produced a food crisis in Slovakia during the spring months.

As in Bohemia and Moravia (q.v.), Nazi Germany employed the willing German minority and the unwilling Jewish minority in Slovakia as instruments for riveting German control upon the country. Backed by Berlin, the German minority leader, Franz Karmasin, pressed the Tiso regime for greater privileges and autonomous rights for Germans, for closer Slovak co-operation with the Reich, and for the elimination of Jews from all fields of activity. Germans frequently occupied the places of influence vacated by Jews under pressure.

Seeking to retain some measure of independence, the Slovak Government resisted the more extreme German demands. Premier Tuka admitted on February 13 that German military and police officers were in Slovakia "by invitation." Early in March it was reported that all-German regiments were being formed among the German minority. But the Tiso regime delayed application of the full Nazi anti-Jewish program as long as possible in an effort to prevent further German infiltration into Slovak economic life. It was disturbed by evidence of growing popular distrust of both Germany and of Slovak leaders co-operating with the Reich.

The issue of German domination led to a split between the moderate Slovak National party leaders and the strongly pro-German leader of the party's Hlinka Guard (Storm Troop) organization, Alexander (Sano) Mach. After a tour of the Reich, Mach resigned as Hlinka Guard commander February 21 to prod the government into closer conformity with the Hitler program. Interior Minister F. Durbansky, on the other hand, urged closer contact with Soviet Russia as a counterweight to Germany.

The great German victory over France in June forced the government to give way and accept Berlin's complete plans for the "new order" in South-eastern Europe. Mach resumed command of the

Hlinka Guard and was taken into the government as Minister of Propaganda. On July 28 President Tiso, Premier Tuka, and Mach conferred with Hitler at Berchtesgaden. Immediately after their return to Bratislava, Mach replaced the allegedly pro-Soviet Durchansky as Minister of Interior. Later he was named Vice Premier, but retained the Interior portfolio and Hlinka Guard leadership.

As Minister of Interior, Mach launched a vigorous drive against the underground Communist movement, which had been secretly disseminating Pan-Slav propaganda. He approved Karmasin's formal request for extensive autonomous privileges for the German minority (August 3). The elimination of Jews from Slovakia's economic, social, and cultural life was pressed as rapidly as economic conditions permitted under authority granted the government by Parliament early in September. This new course, initiated at the conference with Hitler in July, culminated November 24 in Slovakia's formal adherence to the German-Italian-Japanese agreement for a new world order.

Friction between the Slovak Government and Hungary over the treatment of the Hungarian minority in Slovakia and the Slovak minority in Hungary became more intense early in 1940. In February the Slovak Government, in response to vigorous protests, withdrew its decree forbidding the Hungarian minority press to use Hungarian names in referring to places in Slovakia. But the Slovak agitation against the Hungarian minority continued, led by the Hlinka Guard. Late in April there were anti-Hungarian demonstrations in Bratislava. Demands were made for restoration of the districts ceded to Hungary under threat of invasion in 1938 and 1939. On April 30 the Hungarian Foreign Minister publicly warned Slovakia that Hungary would retaliate, despite German protection of the republic, if the treatment of the Magyar minority was not improved.

**SMITHSONIAN INSTITUTION.** An organization founded in 1846 according to the terms of the will of James Smithson of England, who in 1826 bequeathed his property to the United States of America "to found in Washington, under the name of the Smithsonian Institution, an establishment for the increase and diffusion of knowledge among men." The purposes of the Institution are carried out by scientific research, exploration, and publication. It also administers the following bureaus which are supported by Congressional appropriations: The United States National Museum, National Collection of Fine Arts, Bureau of American Ethnology, International Exchange Service, National Zoological Park, and Astrophysical Observatory. It also administers the Freer Gallery of Art and the Division of Radiation and Organisms. The new National Gallery of Art was established as a bureau of the Institution but is administered by the Board of Trustees of the Gallery.

The expendable income of the Institution for 1940, consisting of income from investments, income from miscellaneous sources, and gifts for special objects (excluding income from the Freer endowment) was approximately \$200,000. Its endowment funds (exclusive of the Freer endowment) totaled \$2,197,622. The Institution and the government bureaus under its direction published 78 volumes and pamphlets, of which 146,156 copies were distributed to libraries, educational institu-

tions, and individuals. The secretary is Charles G. Abbot, D.Sc.; the assistant secretary, Alexander Wetmore, Ph.D.

**SOCIALISM.** For organized Socialism 1940 on the European continent was a year of tragedy. At the end of the year, Socialist Parties maintained a fearful and cautious existence under the German protective occupation of Denmark and under the constant threat of it in Sweden. Socialism is in similar condition in Finland, where the great threat is still Russia. There is still a Socialist Party in Switzerland. In every other country in which it existed at the beginning of the year, it has been crushed by the German occupation; its leaders killed, imprisoned, or driven to flight to Great Britain or America. The once mighty Second International, with which all the Democratic Socialist Parties were affiliated, is no more. Its secretary, Dr. Friedrich Adler, now in the United States, believes that it will be impossible to reorganize the International during the war. Such parties as survive on the continent are not free agents. An International organization composed mostly of exiles might be reassembled in Great Britain, but necessarily it would have to be subordinated to the plans of the British government for the winning of the war. Nothing would be gained by setting up a limited debating society in the United States.

The outstanding exception to this story of tragedy is the great increase in the strength of the British Labor Party. Its leaders now sit, not only in the large British cabinet, but in the Prime Minister's smaller war cabinet. They, especially Ernest Bevin, leader of the Transport Workers, the largest union in Britain, now Minister of Labor, are next to the Prime Minister, the strongest men in the cabinet and in the country. The exigencies of war have compelled the British economy to take long strides in collectivism. It will be impossible for a postwar England, whatever the military results of the war, to restore so much of private capitalism as there was prior to the beginning of the war, and it is unlikely that the old British caste system can emerge relatively as unscathed as after the First World War.

The war has the enthusiastic support of the British Labor Party, and, since the blitzkrieg, the critical support of the Independent Labor Party, which, however, opposed labor participation in the cabinet and introduced, near the end of the year, a resolution asking for a clarification of British war aims and an effort to begin peace negotiations. The resolution was overwhelmingly defeated. Later Herbert Morrison of the British Labor Party, Minister of Home Security in the cabinet, in replying to Hitler's speech to the German workers, avowed war aims that were genuinely Socialist in contradistinction to Hitler's national Socialism. They were not, however, clear and explicit, either with regard to Europe or to the future development of democracy within the British Empire.

It is too early to judge with certainty the future power of the British Labor Party, with its non-Marxist type of Socialism. Great Britain is, however, the one country in which the present revolu-

tion toward collectivism may most probably follow Socialist lines, and, after the strain of war is over, develop democratic control rather than fascist. Everywhere the gulf between democratic Socialist Parties and the Communist Party widens. While Socialists do not believe that the partial alliance between Hitler and Stalin will be permanent, they see in it a major source of Hitler's power for aggression. There has been, however, some difference of opinion in Socialist ranks concerning the degree of probability that the British and French governments might have reached a satisfactory understanding with Stalin under a wiser diplomacy. There was no difference of opinion but that Stalin was responsible for the final success of his long efforts to silence Trotsky who was assassinated during the summer in Mexico City.

In the United States division of socialist opinion on the proper policy for the American government to follow concerning the war, was sharpened by the success of the German blitzkrieg. The organized Socialist Party, however, held to its position that to put this country into war would end democracy here for an indefinite period without compensating benefits to other lands; that it would strengthen Churchill and the British imperialists, as against the development of British socialism, and that it would not even guarantee complete military victory in a war that would have to be fought on two oceans and two continents.

The Socialist Party Convention was held the first week of April in Washington, D.C. To the Convention the National Executive Committee reported that careful inquiry had revealed no sign of a nationwide Labor, Farmer Labor, or Progressive Party. The Convention decided, by an overwhelming majority, that to carry on for Socialism required it to nominate a national ticket. Norman Thomas, the Party candidate in 1928, 1932, and 1936, was nominated for President, and Maynard Krueger, Assistant Professor of Economics in Chicago University, for Vice-President.

The Party platform asserted that immediate democratic socialization was the only alternative to a drift to fascism, imperialism, and war. Effective democracy, economic as well as political, it held, requires a great increase in production and a more equitable division of it. This, in turn, requires social control of money, banking, and credit, socialization of the great natural resources, and socialization of those industries and services in which private ownership restrains production. The platform emphasized the necessity of the preservation of civil liberty.

Later in the campaign, when conscription became an issue, the Party and its candidates vigorously opposed it as unnecessary in peace time for military defense, and in itself an invitation to militarism and imperialism and an undemocratic revolution in the American way of life at its best.

Legislation and the interpretation of legislation in various states made it harder for new or minority parties to get on the ballot than ever before. The Socialist Party was not a direct object of attack but suffered somewhat indirectly because of the efforts to exclude the Communist Party.

It succeeded in placing its Presidential ticket and in some cases State or local tickets on the ballots in 29 States, containing about 75 per cent of the population. In other States attempts were made to write in votes, which attempts were ignored in the final official reports except in Oregon. The total vote officially reported was 116,796. This was the largest vote of any of the minority parties, but

the smallest vote in the Party's history since 1900. The course of the election confirmed the tendency of the United States to be a two-party or almost a two-leader country, in which even socialists—in the broad sense of the word—and progressives are concerned for the selection of what they regard as the less of two evils.

After the election the Party decided to try to increase its educational activity through the publication of an official handbook outlining its economic policies, the enlargement of its weekly, the *Call*, and, if possible, a fuller and better use of the radio. It also decided to champion a more generous treatment of refugees in America and to push the democratization of the processes by which the President and vice-president are elected.

In terms of the fulfillment of its own prophecies, Socialism universally found itself in a strange position. It was clear enough by the end of 1940 that the world was caught, not only in war, but revolution. The revolution, however, was of an ugly pattern which did not conform to Socialist expectations. It was collectivist but predominantly totalitarian. Hitler talked of "the world of labor" against "the world of gold," but he remained the worst enemy of democratic Socialism.

Even in the United States a Socialist Party, which had never been inherently a strong force in the national life, saw what it had been accustomed to call its immediate demands appropriated by the Old Parties and especially by President Roosevelt under the New Deal. This fact was strikingly evident from a consideration of the campaign conducted by Wendell L. Willkie, the Republican candidate for President. He regarded himself, and was regarded by many of his followers, almost as a religious crusader for a return to an economy of freedom and abundance, free from autocratic government control. Yet, so far was he from indorsing laissez faire economics, that he felt obliged specifically to list and approve all President Roosevelt's major reforms. Under Mr. Roosevelt, Mr. Willkie evidently felt that those reforms led to destruction but under him they would mean salvation! The fact worth emphasis is that all these reforms were an application of Socialist immediate demands—demands which were ignored or almost contemptuously rejected by both the old parties in 1928 and barely discussed even as late as 1932.

No Socialist of any school would argue that these reforms have achieved Socialism. On the contrary, socialists argue the necessity of Socialism on the basis of the failure of these reforms to work a major cure in our unnecessary poverty and insecurity. Nevertheless, they are completely inconsistent with the theory of "the automatic equilibrium of markets," that self adjustment which was the heart of the theoretical system that Mr. Willkie desired to defend.

The year 1940 saw the emergence of no great Socialist theoretical restatement, but there was much activity of discussion. Socialists who had thought that they were firmly opposed to all conceivable nationalist wars found themselves compelled to justify in socialist terms their ardent support of the British war against Hitler. Socialists who had believed that the "final conflict" would be between private finance capital, largely monopolistic, and working-class socialism, found that the march of collectivism tended to make the struggle one between totalitarianism and democratic socialism. Socialists who had felt it possible to derive all needed wisdom by deduction from the writings of Marx, discovered problems on which the great

theoretician of modern socialism had shed little direct light.

Even the word "socialism" now raises in the minds of the public the most blurred confused picture since the rise of modern socialism. Stalin says that the U.S.S.R. has achieved socialism; Hitler that Germany has achieved national socialism. Besides the Socialist Party in America there is the old Socialist Labor Party, to say nothing of a Social Democratic Federation and at least two Trotskyist groups. Yet so rich is the socialist tradition and so vital its hope that one may expect a theoretical and organizational renaissance of effective world socialism.

**SOCIALIST LABOR PARTY.** See ELECTIONS, U.S. NATIONAL.

**SOCIALIST PARTY.** See ELECTIONS, U.S. NATIONAL; SOCIALISM.

**SOCIAL SECURITY BOARD (SSB).** The Social Security Board has administrative responsibility for three Nation-wide programs, designed to bring greater security to the American people. These are old-age and survivors insurance, employment security, and public assistance, as established under the Social Security Act. The first two of these are insurance systems designed to protect wage earners against future want; the third provides immediate cash aid on the basis of need for three groups who are unable to support themselves—the aged, the blind, and dependent children.

During 1940, major developments under these social security programs included: The beginning of monthly benefit payments under the old-age and survivors insurance system on Jan. 1, 1940; the naming of the Bureau of Employment Security as a national defense agency charged with mobilizing qualified workers through the U.S. Employment Service for national defense industries; the acceptance of merit principles and establishment of merit systems for the selection and promotion of personnel in all State employment-security and public-assistance agencies; and effective Jan. 1, 1940, matching by Federal funds of a higher level of public-assistance payments by States to the needy aged, blind, and dependent children.

These developments, together with continuing progress in the day-by-day administration of the social security programs, made 1940 an outstanding milepost in the American advance toward greater social security.

Amendments passed in 1939 had laid the basis for the extension and strengthening of social security programs which marked 1940. These amendments completely altered the structure of the old-age insurance program, adding benefits for dependents and survivors of insured workers to its original retirement features. Payment of monthly benefits to retired workers over 65 and their families and to the survivors of insured workers became payable Jan. 1, 1940, two years earlier than provided in the original act. Claims awards during the first 12 months of benefit payments were made to some 255,000 individuals, calling for monthly payments at a rate of \$4,700,000. The number of individuals receiving these monthly benefits and the amount payable to them will, of course, increase markedly with each month that passes. Within this over-all figure of 255,000 beneficiaries are encompassed retired workers over 65 who have been engaged in employment covered by old-age

and survivors insurance, their wives over 65, and their dependent children under 18, and the survivors of insured workers who died after 1939—widows over 65, widows regardless of age who are caring for their young dependent children, the children themselves, and aged dependent parents.

The amendments of 1939 included workers over 65 in the system, thus making it possible for many who were already old to acquire sufficient wage credits for benefits. Under this program, which applies to all workers in commercial and industrial employment, individual social security accounts have already been set up for some 52,000,000 people. In these accounts are recorded wages from covered employment which serve as the basis for determining eligibility for benefits and the amount of benefit payments.

These benefits are paid for by taxes on employees in jobs covered by the program and on their employers. The tax rate is 1 per cent for each on wages paid until 1943. Thereafter, it increases  $\frac{1}{2}$  per cent every three years until it reaches a maximum of 3 per cent each in 1949. The tax applies only to the first \$3000 a year in wages paid to an employee. This tax money goes into an Old-Age and Survivors Insurance Trust Fund in the U.S. Treasury, from which all benefits are paid.

Field offices have been established in central towns and cities throughout the country to serve workers and their employers in all matters relating to old-age and survivors insurance. At the close of 1940, 475 of these field offices were in operation.

Protection against want for jobless workers during periods of unemployment was also strengthened through the unification of two services—job insurance and job employment—to form the employment security program. This program, which is a joint Federal-State enterprise, was the result of the President's Reorganization Plan No. 1, effective July 1, 1939, which provided for the transfer of the U.S. Employment Service to the Social Security Board and its co-ordination with the Board's Bureau of Unemployment Compensation. This same integration of employment-service and unemployment-compensation activities is also true in the States. Every State has its own unemployment-compensation law under which jobless workers who are insured receive weekly out-of-work benefits and its own employment service with local offices which register the unemployed and help them to find new jobs.

Federal co-operation encouraged the States to enact unemployment-compensation laws. States with laws approved by the Social Security Board receive Federal grants covering the administrative expenses of their employment-security program, including employment-service operations. A Federal pay-roll tax of 3 per cent is levied on employers of eight or more in all but a few specifically excluded occupations, but up to 90 per cent of this tax may be offset by contributions made by employers in States, with approved laws, to the State unemployment fund.

Every State, Alaska, Hawaii, and the District of Columbia is receiving grants for administration of its employment-security program from the Federal Government. Over 28,000,000 workers in the United States are insured under their State unemployment-compensation laws, and unemployment benefits have been payable in all the States since July 1, 1939. During 1940, weekly benefits totaling about \$520,000,000 were paid to over 5,500,000 jobless workers by the various States. There are now in operation in all the States over 1500 local em-

ployment offices and 3000 additional part-time offices. During 1940, placement of workers in jobs in private industry reached a new high, because of the unusual demand for labor from defense industries. All told, some 3,800,000 jobs were filled, 3,200,000 of them in private industry.

The U.S. Employment Service, as part of its responsibility under the defense program, instituted a special study of workers registered with the local employment offices to find those who had previous work experience that was suitable for defense needs, and to determine which workers who were no longer engaged in their former trade could refurbish their "rusty" skills, which would qualify them for defense jobs, by being given "refresher" courses. To facilitate the movement of workers to areas where there was a demand for their services, a system of regional labor transfer offices, working closely with the State employment services, was established.

Another development during the year had important bearing upon the efficiency with which State social security programs were operating. This was the organization and institution of plans for the selection and promotion on a merit basis of personnel in State employment-security and public-assistance agencies. The amendments of 1939 had included a requirement that all States, in the interests of proper administration, must adopt a merit system for such personnel, effective Jan. 1, 1940.

Federal co-operation and aid to the States has also played an important part in the Nation-wide development of public-assistance programs for the needy aged, the needy blind, and dependent children. The Federal Government matches, dollar for dollar, within certain limits, State payments to needy individuals under public-assistance plans approved by the Social Security Board. For aid to the aged and the blind the act provides Federal money may be used to share in payments to individuals up to a combined Federal-State total of \$40 a month; for dependent children the limit set for Federal matching is \$18 for the first dependent child and \$12 for every other dependent child in the same home.

By the end of 1940, every State, Alaska, Hawaii, and the District of Columbia was participating in the old-age assistance program; 43 of these jurisdictions had approved plans for aid to the blind; and a like number for aid to dependent children. A total of some 3,000,000 needy men, women, and children were receiving monthly cash payments under these plans, including 2,000,000 aged, 50,000 blind, and 845,000 dependent children in 350,000 families.

Federal grants to States for public assistance from Feb. 1, 1936, when Federal funds first became available, through Dec. 31, 1940, totaled \$1,066,120,000. Of this amount, \$891,755,000 represented grants for old-age assistance; \$25,809,000 for aid to the blind; and \$148,556,000 for aid to dependent children. Grants made for 1940 totaled \$310,769,000. Of this amount, \$245,327,000 represented grants for old-age assistance; \$6,880,000 for aid to the blind; and \$58,562,000 for aid to dependent children. See RELIEF.

ARTHUR J. ALTMAYER.

**SOCIETIES AND ASSOCIATIONS.** The following is a list of leading national and international organizations, with their officially proclaimed objectives and a concise report of their activities during the year 1940.

They are listed alphabetically according to the first specific word in each title. Certain classifications have been omitted in this list because they are presented fully elsewhere in this volume. The reader is, therefore, referred to the following articles as a supplement: for accrediting associations, to the article on **UNIVERSITIES AND COLLEGES**, also, **EDUCATION**; for labor organizations, to **AMERICAN FEDERATION OF LABOR**, **CONGRESS OF INDUSTRIAL ORGANIZATIONS**, and **LABOR CONDITIONS**; for political parties and groups, to **ELECTION**, **U.S. NATIONAL**; for religious bodies, to the table of **RELIGIOUS ORGANIZATIONS**, as well as to interdenominational groups listed below; for sport organizations, to articles on various sports and *Amateur Athletic Union*, below; for foundations, trusts, etc., to **BENEFACTIONS** and the articles there referred to; for war relief agencies, to **WAR RELIEF IN THE UNITED STATES**, also, **RED CROSS** and **REFUGEES**. For government agencies, learned academies, and institutes see separate articles

**Accountants, National Association of Cost**, listed under *Cost*

**Actors' Fund of America**, founded in 1882 to care for the impoverished, aged, and infirm members of the theatrical profession. Membership (1939): 2120. President: Daniel Frohman. Secretary: Robert Campbell. Headquarters: 1619 Broadway, New York City. The Fund, supported by donations, benefit performances, and a limited endowment, spends \$140,000 and \$180,000 a year. A home for retired actors is maintained in Englewood, NJ.

**Adult Education, American Association** for, founded in 1926 to serve as a clearing house for information, initiate activities and assist enterprises already in operation, and to aid and advise individuals who, although occupied with some vocation or interest, desire to continue their education. Membership: 1400. President: Harry A. Overstreet. Director: Morse A. Cartwright. Headquarters: 60 East 42 Street, New York City. The 1940 meeting, held in New York with an attendance of 2023, had as its theme "The Democratic Way and the Educational Process." During the year an active program of adult education for democracy was conducted, and another relating adult education to the defense programs was inaugurated, resulting in the publication of three periodicals, *Defense Papers*, *Defense Digests*, and *Community Councils in Action*.

**Advancement of Colored People, National Association** for the, founded in 1909 to combat the spirit of persecution which confronts colored people in the United States, safeguard their rights, and secure for them equal opportunity with all other citizens. Membership: 100,000. President: Arthur B. Spingarn. Executive Secretary: Walter White. Headquarters: 69 Fifth Avenue, New York City. The Spingarn Medal for 1940 was awarded to Dr. Louis T. Wright of New York. The 32d Annual Conference will be held in Houston, Texas, June, 1941. See **LYNCING**; **NEGROES**.

**Advancement of Music, National Bureau** for the, founded in 1916 to promote musical interest and activities and to aid those interested in them. It has no membership other than the ten members of the Board of Control. President and Managing Director: C. M. Tremaine. Secretary: Osbourne McConathy. Headquarters: 45 West 45 Street, New York City. The Bureau co-ordinates existing agencies in the field of music and promotes, also, **National Music Week** (beginning the first Sunday in May), school music contests and festivals, and group instruction in applied music.

**Advancement of Science, American Association** for the, founded in 1848, a democratic and representative organization devoted to the whole field of science. Organized in 15 sections, it has over 20,000 members and 174 associated societies. President: Dr. Irving Langmuir. Permanent Secretary: Dr. F. R. Moulton. Headquarters: Smithsonian Institution Building, Washington, D.C. In 1940 a paper by Dr. Herald R. Cox, Rocky Mountain Laboratory, U.S. Public Health Service, was selected for the Theobald Smith Award in the Medical Sciences; it was entitled "Cultivation of Rickettsiae of the Rocky Mountain Spotted Fever, Typhus, and Q Fever Groups in the Embryonic Tissues of Developing Chicks." The Thousand Dollar Prize was awarded to D. R. Hoagland and D. I. Arnon, University of California, for the paper entitled "Availability of Nutrients with Special Reference to Physiological Aspects," presented at the meeting in Philadelphia, Dec. 27, 1940, to Jan. 2, 1941. Scheduled meetings: Durham, N.H., week of June 23, 1941; Chicago, Ill., week of Sept. 22, 1941; Dallas, Tex., Dec. 29, 1941, to Jan. 3, 1942. See **PSYCHIATRY**.

**Advancement of Sciences, British Association** for the, founded in York, England, in 1831. President: Sir Richard

Gregory; Secretary, O. J. R. Howarth. Headquarters: Burlington House, London, W. 1. The Association holds an annual meeting at which papers are read (subsequently published) and sets aside an annual sum for scientific researches. In lieu of the appointed 1940 meeting, a short Conference was arranged, July 25-27, in the University of Reading, which dealt in general terms with Science in National and International Aspects. It was decided that the 13 sections of the Association would not meet individually unless cause should arise, and no new sectional officers were appointed. The April issue of the official journal, *The Advancement of Science*, was reduced in bulk, owing to the rationing of paper, but publication was expected to continue.

**Advertising Federation of America**, founded in 1905 to advance the interests of all who create, sell, or use advertising, and to increase its usefulness to the consuming public. Membership: 10,000. President: Elton G. Borton. Secretary: May O. Vander Pyl. Headquarters: 330 West 42 Street, New York City. The 37th annual convention and exposition will be held at the Hotel Statler, Boston, Mass., May 25-29, 1941.

**Aeronautic Association, National**, founded in 1922, a non-profit and non-partisan organization representing the public interest in aviation and interested in every phase of aviation. Membership: over 10,000. President: Gill Robb Wilson. General Manager: G. deFreest Lerner. Headquarters: Willard Hotel, Washington, D.C. Activities of 1940 included the National Aviation Forum held at Washington, D.C., in May and the Denver Air Congress, July 7-10. The Mackay Trophy for 1939 was awarded in 1940 to the Second Bombardment Corps, U.S. Army Air Corps, for a hazardous flight made to Chile, Feb. 4, 1939, to carry medical supplies to the earthquake area. The Collier Trophy for 1939 was awarded to the domestic airlines of the United States for their high record of safety, with special recognition to Mrs. Walter M. Boothby and William R. Lovelace, II, of the Mayo Foundation and to Capt. Harry C. Armstrong of the U.S. Army Medical Corps, for their work in aviation medicine in general and pilot fatigue in particular. The 1941 meeting is tentatively scheduled for July at Louisville, Ky.

**Alcoholism, World League against**, founded in 1919 to attain by means of education the total suppression of alcoholism throughout the world. Membership: 51 national temperance organizations in 31 countries. Executive Secretary: Ernest H. Cherrington. Headquarters: Westerville, Ohio. During 1940 the League continued to supply factual and source material to temperance organizations in practically every country, to publishers of temperance periodicals, and to schools. It maintains at Westerville, Ohio, a large reference library on the subject of alcohol.

**Amateur Athletic Union of the United States**, founded in 1888 to improve and promote amateur sports and the civic interest of the Nation, by the education of all classes in the benefits to be derived by participation in athletics. The A.A.U. establishes a uniform test of amateur standing and uniform rules governing the sports within its jurisdiction, regulates and awards the athletic championship of the United States, and promotes legislation in the interest of sports facilities. President: L. di Benedetto. Secretary: D. J. Ferris. Headquarters: 233 Broadway, New York, N.Y. For activities and awards during 1940, see the separate articles on the various sports.

**American Legion**. See separate article.

**American-Scandinavian Foundation**, founded in 1911 to assist cultural relations between America and the Scandinavian countries. President: Henry Goldard Leach. Headquarters: 116 East 64 Street, New York City.

**Antiquarian Society, American**, founded in 1812 with the maintenance of a national library of American history as its chief purpose. The library contains nearly 700,000 titles and is free for the use of all qualified scholars. Membership: 200. President: Samuel Eliot Morison. Director: Clarence S. Brigham. Headquarters: Worcester, Mass. Clifford K. Shipton was appointed librarian in October, 1940. Scheduled meetings: Boston, Mass., April, 1941; Worcester, Mass., October, 1941.

**Anti-Saloon League of America**, founded in 1895 to promote temperance education and legislation; a non-membership organization. President: Bishop Ralph S. Cushman. General Secretary: George W. Crabbe. Headquarters: 131 B Street, S.E., Washington, D.C. The biennial national convention held in Washington, D.C., Nov. 24-26, 1940, reaffirmed the general program adopted in 1938. The League noted in its report that, during 1940, the first State which had legalized liquor following repeal of national prohibition reversed its attitude. In an advisory referendum on August 27, South Carolina voted 189,361 for and 130,366 against repeal of the liquor law, a majority of 58,995. In Oklahoma, on November 5, a repeal of the State prohibition amendment was defeated by 374,911 to 290,752. Returns showed a slight increase in the number of no-license units in elections held during 1940 under local option.

**Applied Psychology, American Association for**, founded in 1937 to promote the service which psychology as a science can render society in its application in business, education, industry, law, medicine, mental hygiene, social welfare, and related fields. Membership: 600. President:

Edgar A. Doll. Executive Secretary: C. M. Louttit, Indiana University, Bloomington, Ind. During 1940 the Association published, in addition to *The Journal of Consulting Psychology*, the first biographical directory of applied psychologists. Scheduled meeting: Northwestern University, September, 1941.

**Archaeological Institute of America**, founded in 1879 to promote and direct archaeological investigation and research. Membership: 1600. President: William Bell Dinsmoor. General Secretary: Dr. Meriwether Stuart. Headquarters: 504 Schermerhorn Hall, Columbia University. The 1941 meeting will be held at Hartford, Conn., Dec. 29-31.

**Architects, The American Institute of**, founded in 1857 to promote the efficiency of the profession, to advance education in architecture and allied subjects, and to make the profession of increasing service to society. Membership: 3048. President: Edwin Bergstrom. Secretary: Charles T. Ingham. Headquarters: The Octagon, 1741 New York Avenue, N.W., Washington, D.C. Mrs. Beatrice Farrand, landscape architect, was elected an honorary member in 1940. The 73d Annual Convention will be held in Yosemite Park, Calif., May 17-21, 1941.

**Artists Congress, American**. See ART under *Other Developments*.

**Arts, The American Federation of**, founded in 1909 to develop art and its appreciation. President: Hon. Robert Woods Bliss. Director: Thomas C. Parker. Headquarters: Barr Building, Washington, D.C. The 1941 annual convention will be held in Washington, D.C., concurrently with the opening of the National Gallery of Art.

**Arts and Letters, National Institute of**, founded in 1898 to further the interests of literature and the fine arts. Membership: 250. President: Walter Damrosch. Secretary: Henry S. Canby. Headquarters: 168 East 71 Street, New York City. A Gold Medal was awarded in 1940 to William Adams Delano for architecture. Scheduled meetings: the Public Ceremonial, Jan. 18, 1941, at Carnegie Hall in New York; the Annual Dinner-Meeting, Dec. 10, 1941, in New York.

**Arts and Sciences, American Academy of**, founded in 1780 to encourage scientific work and publication. Membership: 779 Fellows and 129 Foreign Honorary Members. President: Harlow Shapley. Recording Secretary: Hudson Hoagland. Headquarters: 28 Newbury Street, Boston, Mass. During 1940 a number of grants for research work were made from funds given the Academy for that purpose. Meetings are held monthly, October through May.

**Asiatic Association, American**, founded in 1898 to study relations between Asiatic countries and the United States. Membership: 200. President: Howard E. Cole. Secretary: John B. Chevalier. Headquarters: India House, Hanover Square, New York City.

**Astronomical Society, American**, founded in 1899 to advance astronomy and closely related branches of science. Membership: 627. President: Joel Stebbins. Secretary: Dean B. McLaughlin, University of Michigan Observatory, Ann Arbor, Mich. The Annie J. Cannon Prize was awarded in 1940 to Julie Vinter Hansen, astronomer at the Observatory of Copenhagen. Scheduled meetings: September, 1941, Yerkes Observatory, Williams Bay, Wis.; December, 1941 (tentatively in Cleveland).

**Audubon Society, National**, founded in 1905 for the protection of wild birds and animals. Membership: 156 affiliated clubs and 6115 individuals. President: Guy Emerson. Executive Director: John H. Baker. Headquarters: 1006 Fifth Avenue, New York City. Activities during 1940 included a campaign to stop illegal traffic in wild bird plumage, investigation of the destruction of fish-eating birds at fish hatcheries and rearing ponds, and the appointment of a full-time representative of the Society for the State of California. Research projects were conducted in connection with the Roseate Spoonbill, the California Condor, and the Ivory-billed Woodpecker. The 1941 annual meeting is scheduled, October 17-21, in New York City.

**Automobile Association, American**, founded in 1902 to provide a national network of service and protection for motor-club members and to work for the improvement of motoring conditions. Membership in A.A.A. Clubs: about 1,021,000. President: Thos. P. Henry. General Manager: Russell E. Singer. Headquarters: 17th Street and Pennsylvania Avenue, N.W., Washington, D.C. During 1940 the million-member mark was passed for the first time. A nationwide Pedestrian Protection Contest was participated in by all States and hundreds of cities; the first State prize went to Minnesota and first prize for large cities to Cleveland, Ohio. A roadside protection program was formulated following extensive public hearings. The President of the Association was appointed to the National Defense Advisory Commission (q.v.) and the Association engaged in defense activities, including official observation of Army maneuvers.

**Automobile Manufacturers Association**, founded in 1913 for service to the motor industry. Membership: 29. President: Alvan Macauley. Secretary: Byron C. Foy. Headquarters: New Center Building, Detroit, Mich. The Association conducts annually the National Automobile

Show at New York. The 1941 meeting will be held at Detroit in June.

**Bacteriologists, Society of American**, founded in 1899 to promote the science of bacteriology and bring together American bacteriologists for demonstration and discussion of methods and consideration of subjects of common interest. Membership: about 1500. President: Dr. O. T. Avery. Secretary: Dr. I. L. Baldwin. Headquarters: University of Wisconsin, Madison, Wis. The Eli Lilly Award in Bacteriology and Immunology for 1940 was granted to Dr. D. W. Woolley of the University of Rochester. The 1941 meeting will be held in Baltimore, Md., Dec. 20-31.

**Bankers Association, American**, founded in 1875 to promote the welfare and usefulness of banks, secure uniformity of action on subjects of importance and provide opportunity for discussion thereon, and to provide educational opportunities for bank officers and employees. Membership: 14,333. President: P. D. Houston. Headquarters: 22 East 40 Street, New York City. Four new departments were established in 1940—Consumer Credit, Research in Mortgage and Real Estate Finance, Economics, and Customer Relations. Scheduled meetings: Regional, March 5-7, 1941, in New York City and March 20-21 in Louisville, Ky.; Trust, February 4-7, New York City; Annual Convention, September 28-October 2, Chicago, Ill. See **BANKS AND BANKING**.

**Bankers' Association, Investment**. See **FINANCIAL REVIEW** under *Financial Regulation*.

**Banks, National Association of Mutual Savings**, listed under *Mutual*.

**Bar Association, American**, founded in 1878 to advance the science of jurisprudence, promote the administration of justice and uniformity of legislation and judicial decision, uphold the honor of the profession, encourage cordial intercourse among members of the Bar, and correlate activities of State Bar Associations. Membership: 31,622. President: Jacob M. Lushly. Executive Secretary: Olive G. Ricker. Headquarters: 1140 North Dearborn Street, Chicago, Ill. In 1940 the Award of Merit was given to the State Bar of Texas and the Cleveland Bar Association. The American Bar Association Medal was awarded to Roscoe Pound, Dean Emeritus of Harvard Law School and the Ross Essay Prize to T. F. Green of Athens, Ga. Scheduled meetings: House of Delegates, Mar. 17-18, 1941, Chicago, Annual, Sept. 29, 1941, Indianapolis.

**Beethoven Association**. See **MUSIC**.

**Better Business Bureaus, Inc., National Association of**, founded in 1913 to encourage the formation of and assist in the development of Better Business Bureaus engaged in fostering truth in advertising and opposing fraud and/or unethical practices in advertising and selling. Membership: 74 associations. President: R. J. Bauer. Secretary: Muriel N. Tsvetkoff. San Francisco Better Business Bureau. The 1941 meeting will be held in Los Angeles, Calif. In May, 1940, a Business-Consumer Relations Conference was held in New York City.

**Bible Society, American**, founded in 1816 to encourage wider circulation of the Holy Scriptures without note or comment throughout the world. Membership probably over 10,000. President: John T. Manson. General Secretary: Dr. Eric M. North. Headquarters: Park Avenue and 57th Street, New York City. Universal Bible Sunday was observed Dec. 8, 1940. The 1941 annual meeting will be held May 8.

**Bibliographical Society of America**, founded in 1904 to promote bibliographical research and issue publications. Membership: 750. President: Randolph G. Adams. Permanent Secretary: George L. McKay, 47 East 60 Street, New York City. Scheduled meetings: June, 1941, in Boston; December, 1941.

**Birth Control Federation of America, Inc.**, founded in 1939 by the American Birth Control League (1921) and the Birth Control Clinical Research Bureau (1923) to foster planned parenthood by making birth control information available. Membership: about 34,000. Margaret Sanger is Honorary Chairman. President: Dr. Richard N. Pierson. Secretary: Albert D. Lasker. Headquarters: 501 Madison Avenue, New York City. The 1941 annual meeting is scheduled, Jan. 28-30, in New York City. See **BIRTH CONTROL**.

**Blind, Inc., American Foundation for the**, founded in 1921 to promote those interests of the blind which cannot be advantageously handled by local agencies. President: M. C. Migel. Executive Director: Robert B. Irwin. Headquarters: 15 West 16 Street, New York City. Activities include research, assistance and consultation service to local agencies, special services to individuals, scholarships, and a reference and lending library.

**Blindness, National Society for the Prevention of**, listed under *Prevention*.

**B'nai B'rith**, a Jewish service and fraternal organization, founded in 1843 to further the highest ideals of humanity through a program that encompasses adult education, promotion of youth welfare, communal service, philanthropy, patriotism, and good will. Membership: 125,000. President: Henry Monsky. Secretary: Maurice Bisgier. Headquarters: 1003 K Street, N.W., Washington, D.C. During 1940 B'nai B'rith contributed \$55,000 for war re-

lief and refugee aid, established a national defense committee to co-operate with the Government and agencies engaged in morale work, and embarked with the Red Cross on a nationwide home service program for families of men in the armed service. Nearly 1,000,000 people of all races and creeds attended B'nai B'rith patriotic meetings and youth and democracy rallies organized by Aleph Zadik Aleph, the youth agency. Hillel Foundations increased to 50, serving 30,000 Jewish college men and women with a program of religious and social welfare and cultural activities. Boy Scouting was made an integral part of the activity of B'nai B'rith during the year. The next triennial convention will be held in Chicago, Mar. 29-Apr. 2, 1941.

**Board of Review of Motion Pictures, Inc., National**, listed under *Review*.

**Botanical Society of America, Inc.**, established in 1906 as a clearing house for the botanists of America. It supports projects of general interest to botanists, provides an opportunity for the presentation and publication of research studies, and accepts and administers funds for certain purposes. Membership: 1250. President: E. N. Transeau. Secretary: Paul R. Burkholder. Osborn Botanical Laboratory, Yale University, New Haven, Conn. The Society will meet in Dallas, Tex., in December, 1941.

**Boys' Clubs of America, Inc.**, organized nationally in 1906 by existing Boys' Clubs to promote their development and improvement. Membership: 348 organizations reaching 300,000 boys. President: William Edwin Hall. Chairman: Herbert Hoover. Secretary: William Ziegler, Jr. Headquarters: 381 Fourth Avenue, New York, N.Y. During 1940 the organization successfully concluded a Five Year Mile Post Plan, during which the number of clubs and members was materially increased. A special medal was awarded to James Gilbert White for his outstanding service in the cause of the underprivileged boy. The 1941 annual conference will be held in May.

**Boy Scouts of America**, founded in 1910 to promote the ability of boys to do things for themselves and others, to train them in Scoutcraft, and to teach them patriotism, courage, self-reliance, and kindred virtues. Membership: 1,421,945. President: Walter W. Head. Chief Scout Executive: James E. West. Headquarters: 2 Park Avenue, New York, N.Y. During 1940 the Boy Scouts of America launched a Program of Action for Strengthening and Invigorating Democracy and joined with 15 other national organizations (under the auspices of the Citizenship Educational Service) in issuing "A Call to All Americans," a statement designed to arouse all citizens to vitalize the ideals of American Democracy. Boy Scouts participated in both the San Francisco and New York World's Fairs. At the New York Fair a Demonstration and Service Camp was maintained where nearly 3000 Scouts camped for one week each while rendering service to the Fair.

**Broadcasters, National Association of**, founded in 1922 to promote and defend the American system of privately owned, competitively operated radio and to render every aid to those engaged in it to enable them to operate in the public interest. Membership: 510. President: Neville Miller. Assistant to the President: C. E. Arney, Jr. Headquarters: Normandy Building, 1626 K Street, N.W., Washington, D.C. See **MUSIC**.

**Broadcast Music, Inc. (BMI)**. See **MUSIC**.

**Bund, German-American**. See **DIES COMMITTEE**, **FASCISM**.

**Business and Professional Women's Clubs, Inc.**, The National Federation of, founded in 1919 to bring about a spirit of co-operation among business and professional women of the United States and to extend opportunities to them through education along the lines of industrial, scientific, and vocational activity. Membership: 70,000. President: Dr. Minnie I. Maffett. Executive Secretary: Louise Franklin Bache. Headquarters: 1819 Broadway, New York City. During 1940 the Federation followed a program on "Making Democracy Work," making use of discussion and other approved adult-education media in the clubs and exploring ways in which groups can go from study to action in an intelligent way. New York State was selected as a testing ground for methods in organization and program in an effort to see why more women do not belong to organized groups. A study entitled "Should Married Women Work" was published. The next biennial convention will be held in Los Angeles, Calif., July 6-12, 1941.

**Campaign for Youth Needs**. See article on **YOUTH MOVEMENT**.

**Camp Fire Girls, Inc.**, incorporated in 1912 to provide an opportunity for girls' personal development, through group experiences, leisure-time activities, and cultivation of skills. Membership: 278,451. The President is Mrs. Elbert Williams, Secretary and National Executive, Mr. Lester F. Scott. Headquarters: 88 Lexington Avenue, New York City. During 1940 Camp Fire Girls placed special emphasis on the safety and health features of the program in an activities project called "Skillful Living." They made home safety surveys, drew up codes for themselves as bicyclers, roller skaters, and pedestrians, practiced skill in sports, considered well balanced meals, and well balanced daily schedules with time for work, fun, and relaxation. The older girls undertook a city housekeeping project which involved a study of the city's electric, gas,

and water supplies and sanitation system. Albums recording data collected and recommendations made were sent to National Headquarters.

**Cancer, Inc., The American Society for the Control of,** listed under *Control*.

**Care of European Children, U.S. Committee for the.** See *CHILDREN'S BUREAU, WAR RELIEF*.

**Catholic Welfare Conference.** See separate article.

**Chamber of Commerce, International,** founded in 1920 to provide business men and organizations with a continuing mechanism for interchange of information, joint study, consultation, and periodical conference. Membership: National Committees in 32 countries and affiliated organizations in 18. President: J. Sigfrid Edstrom of Sweden. Chairman of the American Section: Eliot Wadsworth; Manager, Chauncey D. Snow. Headquarters. 38 Cours Albert Premier, Paris, France (temporarily removed to 9, Vasträ Trädgårdsgatan, Stockholm, Sweden). Offices of the American Section: 1615 H Street, N.W., Washington, D.C. During 1940 the International Chamber of Commerce entered upon studies of Economic Reconstruction and established co-operative arrangements with the American Arbitration Association for settlement of trade disputes involving American business men.

**Chamber of Commerce, United States Junior.** An organization founded in 1920 to organize young men between 21 and 35 for civic service and community building activities. Membership: 120,000. Headquarters: Merchandise Mart Building, Chicago, Ill. Americanism week was observed Feb. 12-22, 1940. Prizes and trophies valued at about \$8000 were awarded for committee activities and excellence of operation, and local and National Distinguished Service Awards were made to outstanding young men. The 1941 annual convention will be held in Minneapolis, Minn., June 18-21.

**Chamber of Commerce of the United States,** established in 1912 primarily as a vehicle for the expression of national business opinion on important economic questions. Membership: 1626 chambers of commerce and trade associations, 6441 individuals, and 3519 associates. President: James S. Kemper. Secretary: Ralph Bradford. Headquarters: 1615 H Street, N.W., Washington, D.C. The Chamber is centering its attention mainly upon defense problems, holding many regional conferences of business leaders in all parts of the country to discuss the place of industries in the national defense effort. Chamber spokesmen appear before congressional committees to present a practical business viewpoint on pending legislation. Twelve service departments are maintained covering the main divisions of business activity. Publications include the *Nation's Business*, a monthly, the *Washington Review*, bi-monthly, special legislative bulletins, and committee reports. The 29th Annual Meeting will be held in Washington, D.C., Apr. 28-May 1, 1941.

**Chautauqua Institution,** founded in 1874 for religious and educational purposes. President Arthur E. Restor. Secretary: Charles E. Pierce. Headquarters: Chautauqua, N.Y. A program of music, lectures, and religious services is conducted during July and August each year.

**Chemical Industry, Society of.** See *CHEMISTRY, INDUSTRIAL*.

**Chemical Society, American,** founded in 1876 to advance chemistry, chemical research and knowledge, and the qualifications and usefulness of chemists. Membership: 25,414. President: Harry N. Holmes. Secretary: Charles L. Parsons. Headquarters: Mills Building, Washington, D.C.

In 1940 the Award in Pure Chemistry was made to Laurence Olin Brockway, the Eli Lilly and Company Award to Eric G. Ball, and the Women's Award to Mary Engle Pennington. At the request of the Executive Office of the President and in co-operation with the National Roster of Scientific and Specialized Personnel, the Society gathered a National Roster of over 50,000 chemists and chemical engineers. Two general meetings were conducted during the year at which a successful Employment Clearing House brought together employers and employees. The Society's publications were increased in size, and one new local section was established. Meetings in 1941, St. Louis, April 7-11, and Atlantic City, Sept. 8-12. See *CHEMISTRY*.

**Child Labor Committee, National,** founded in 1904 to promote legislation dealing with child labor and related subjects, conduct investigations, advise on administration, and maintain an information service. Membership: about 15,000. Chairman: Homer Folke. Headquarters: 419 Fourth Avenue, New York City. Activities in 1940 included an investigation of children employed on the legitimate stage, participation in hearings on Federal child-labor bills, participation in the White House Conference on Children in a Democracy (see *CHILDREN'S BUREAU*), and a field trip by the General Secretary to FSA Rural Rehabilitation, migrant camp, and farm purchase projects in 10 States. Six new publications were issued.

**China Society of America, The,** founded in 1913 to promote friendly relations and a better understanding between the peoples of the United States and China. Membership: 300. President: William M. Chadbourne. Headquarters: 570 Lexington Avenue, New York City. During 1940 luncheons were held in honor of Dr. Lin Yutang and

Maj. Evans Carlson. The Society distributed information about China to teachers throughout the United States and published *China* magazine.

**Christian Endeavor, International Society of,** formed in 1885 to further the training of young people in the Christian life, among societies and unions in about 30 evangelical denominations in the United States and Canada. Membership: approximately 2,000,000. President: Dr. Daniel A. Poling. Executive Secretary: Carroll M. Wright. Headquarters. 41 Mt. Vernon Street, Boston, Mass. The Rainbow Jubilee Year (60th anniversary) of the first group was held in 1940, climaxed by the celebration of Christian Endeavor Week, Jan. 26-Feb. 2, 1941. The 38th International Convention will be held in Atlantic City, N.J., July 8-13, 1941.

**Christian Front.** See *DIXIE COMMITTEE; FASCISM; NEW YORK* under *New York City*.

**Christians and Jews, National Conference of,** founded in 1928 to moderate and finally eliminate a system of prejudices which disfigures business, social, and political relations. Membership: 16,500. Co-Chairmen: Arthur H. Compton, Carlton J. H. Hayes, Roger W. Straus. Director: Everett R. Clinchy. Headquarters: 300 Fourth Avenue, New York City. The Williamstown Institute of Human Relations will be held at Williamstown, Mass., the last week in August, 1941.

**Churches, The World Council of,** established as a provisional committee after the world conferences at Oxford and Edinburgh in 1937 to unite the churches of the world on the Federal principle for co-operative service and the promotion of Christian unity. Membership: 70 denominations. World Chairman: The Archbishop of York. General Secretaries: Dr. W. A. Visser 't Hooft, Geneva; Dr. William Paton, London; Dr. Henry Smith Leiper, New York. Regional consultations on wartime responsibilities of the Churches were held in the Balkans, in Canada, and in England, as well as in Geneva in 1940. A chaplaincy service to prisoners of war was organized and likewise a special service to refugees from Europe. The American Section meets in New York City in May and October.

**City Managers' Association, The International,** founded in 1914 to aid in the improvement of local government administration and the proficiency of city managers. Membership: 596. President: Roy S. Braden. Headquarters: 1313 East 60 Street, Chicago, Ill. Publications issued in 1940 included *The Municipal Year Book, 1940*, edited by Ridley and Nolting, and *Municipal Public Relations* by Elton D. Woolpert. The Institute for Training in Municipal Administration made available two new correspondence courses: *The Technique of Municipal Administration* and *Municipal Recreation Administration*.

**Civic Federation, The National,** founded in 1900 to aid in moulding a sound public opinion. Chairman of the Executive Council: Mack W. Beeks. Secretary: Mrs. Ralph M. Easley. Headquarters: 74 Trinity Place, New York City. Church attendance was advocated in 1940 to stimulate religious recovery. Patriotic posters were distributed in schools, boys' clubs, and Grange halls to counteract the propaganda of the dictators and inculcate American principles, especially in the minds of youth.

**Civil Engineers, American Society of,** founded in 1852 to advance engineering and architectural knowledge and practice, to maintain high standards and encourage intercourse in the profession. There are 64 local sections and 120 affiliated student chapters. Membership, 16,694. President: Frederick H. Fowler. Secretary: George T. Seabury. Headquarters. Engineering Societies Building, 33 West 39 Street, New York City. The Norman Medal was awarded in 1940 to Charles H. Lee, the Croes Medal to C. A. Mockmore, the Laurie Prize to Stanley M. Dore, the Wellington Prize to Rufus W. Putnam, the Collingwood Prize for Juniors to B. K. Hough, Jr., the Construction Engineering Prize to Howard L. King, and the Hering Medal of the Sanitary Engineering Division to A. J. Schafmayer and the late B. E. Grant. The 1941 Annual Meeting was scheduled Jan. 15-17 in New York City; other meetings at Baltimore, April 23-25, San Diego, July 23-25, and Chicago, Oct. 15-17, 1941.

**Civil Liberties Union, American,** founded in 1920 to maintain the Bill of Rights for everybody, without exception. Membership: 5626. Chairman of the National Committee: Edward A. Ross. Chairman of the Board of Directors: Rev. John Haynes Holmes. Director: Roger N. Baldwin. Headquarters: 31 Union Square West, New York City. The Union continued during the year its practice of publicly condemning or commending proposed legislation or court decisions affecting democratic rights. The 150th anniversary of the submission of the Bill of Rights to the States was celebrated under the auspices of national and local committees. A large national conference, organized in New York, Oct. 13-14, and attended by 2500 persons, was devoted to "Civil Liberties in the Present Emergency." The radio news service throughout the year served 113 stations in 40 States with a weekly script entitled "Civil Liberty in the News." In a one-act play contest conducted in co-operation with the *One-Act Play Magazine*, a \$100 prize was awarded to Noel Houston's *According to the Law* (produced at the Provincetown Playhouse in New York) and Philo Higley's *First Free-*

dom. Dr. Harry F. Ward, chairman of the Union since its organization, resigned in 1940 because of opposition to the resolution defining qualifications for membership on the National Committee and Board of Directors. A controversy, long latent, arose in the Board of Directors over participation of Communists in the Union's affairs. At the annual meeting a resolution was adopted by the Board and the National Committee holding it "inappropriate for any person to serve on the governing committees of the Union or on its staff, who is a member of any political organization which supports totalitarian dictatorship in any country, or who by his public declarations indicates his support of such a principle." The Union had not for 20 years elected a Communist to its governing committee or staff, although two persons had joined the Communist party after their election. One was Elizabeth Gurley Flynn, member of the Board of Directors, whose resignation was requested and refused. The Board instituted proceedings to remove her, and the points at issue were submitted to the entire membership of the Union. Early returns showed 775 in favor of the Board's action with 160 opposed. Receipts for the year in all funds were \$34,343, an increase of \$4112. Four new committees were formed during the year, three in Illinois. Publications included the yearly *Story of Civil Liberty*, the *Civil Liberties Quarterly*, and a running index of all relevant magazine articles.

**Civil Service Reform League, National**, founded in 1881 to improve and extend the merit system in the public service. Membership: 3000. President: Samuel H. Ordway, Jr. Executive Secretary: H. Eliot Kaplan. Headquarters: 521 Fifth Avenue, New York City. In 1940 a nationwide Committee of Business and Industry was organized to arouse interest in the merit system. The League's field program was extended through organization of State committees and of merit-system institutes throughout the country. A fifty-dollar prize was offered to the Junior Chamber of Commerce submitting the outstanding report of merit-system activity. During the year the League was active in behalf of the Ramspeck Bill (see CIVIL SERVICE), the inclusion of national defense positions under civil service rules, and the adoption of civil service laws in several States and cities.

**Civitan International**, founded in 1918 for the building of good citizenship, curbing of crime, and elimination of tuberculosis. Membership about 10,000. President Dr. Don C. Rogers. Secretary Arthur Cundy. Headquarters: 800 Farley Building, Birmingham, Ala. For the fiscal year 1939-40 the organization reported the largest gain since its inception. Citizenship Essay Contests, conducted in public high schools, were participated in by 50,000 students, \$5000 in prizes were awarded. The international convention will be held at Chicago in June, 1941.

**Classical League, American**, formed in 1919 as a national organization for teachers of classics. Membership 4600. President: B. L. Ullman. Secretary-Treasurer: Rollin H. Tanner. New York University, New York City. The organization publishes *The Classical Outlook* and maintains a Service Bureau. It will meet (with the National Education Association) at Atlantic City, Feb. 25, 1941, and at Boston, June 30-July 2.

**Coal Association, National**. See COAL AND COKE.

**Colored People, National Association for the Advancement of**, listed under *Advancement*.

**Color Print Society, American**. See PRINTS.

**Composers and Conductors, The National Association for American**, founded in 1933 to advance the interests of the American composer, especially in relation to orchestral conductors, and to secure a hearing for serious works of merit. Membership over 500. President: Sigmund Spaeth. Headquarters: The Henry Hadley Studio, 15 West 67 Street, New York City. In addition to regular meetings and concerts, the Association sponsored in 1940 All-American programs at the Hotel des Artistes and the Macdowell Club, an orchestral concert at the Metropolitan Opera House, a memorial concert at the Academy of Arts and Letters in honor of Henry Hadley, and broadcasts of American music over stations WNYC, WQXR, and WABC. The Henry Hadley Memorial Library was established at the New York Public Library under the direction of Carleton Sprague Smith. The Henry Hadley Medal for service to American music during 1939-40 was awarded to Gene Buck, President of ASCAP. Certificates were awarded to Roy Harris, Howard Barlow, Serge Koussevitzky, F. D. Perkins, and Station WNYC.

**Composers, Authors, and Publishers, American Society of (ASCAP)**, founded in 1914 to provide American creators of musical works a co-operative movement to protect members' copyrights from unauthorized commercialization. Membership, 1200 composers and authors (155 deceased) and 136 publishers. President: Gene Buck. General Manager: John G. Paine. Headquarters: 30 Rockefeller Plaza, New York City. During 1940 Federal Courts in three jurisdictions, Nebraska, Tennessee, and Florida, sustained ASCAP's challenge of the constitutionality of the uniform anti-ASCAP law in various States aimed at outlawing ASCAP's licensing operations. The U. S. Supreme Court announced in December that it would review decisions. Many radio stations started 1941 without renewal of ASCAP licenses, radical changes in programs

resulting. Awards made during the year included eight fellowships (\$720 each) for college musical plays and awards of \$100 each in law schools throughout the country for essays on copyright law. An annual membership meeting is held, usually in April. See MONTANA; Music under *General News*.

**Composers, Inc., The League of**, founded in 1923 to further the works by living composers of all nationalities, as well as to help composers by commissions for new works and general promotion of their compositions. Executive Chairman: Mrs. Arthur M. Reis. Headquarters: 113 West 57 Street, New York City. In the 1940-41 season, the League took its first step in promoting distribution of new music on records, releasing by subscription Schonberg's "Pierrot Lunaire." Commissions were awarded to Robert Palmer and Bernard Rogers for radio and to Theodore Chanler for the Town Hall Award. The League publishes a quarterly, *Modern Music*, and conducts a program series in New York and over the air. Two programs at the Museum of Modern Art in 1940-41 featured Darius Milhaud and Music with Films.

**Consumer-Retailer Council, Inc., National**, founded in 1937 to enable consumers and retailers to work out together their mutual problems. Membership: American Association of University Women, American Home Economics Association, General Federation of Women's Clubs, American Retail Federation, National Association of Food Chains, National Retail Dry Goods Association, National Shoe Retailers Association, National Better Business Bureau, Inc. Chairman: H. W. Brightman. Executive Secretary: Roger Wolcott. Headquarters: 8 West 40 Street, New York City. Accomplishments of 1940 included an agreement by the National Association of Food Chains to adopt labels approved by the Council on certain canned fruits and vegetables, and the inauguration of an experiment in Newark, N.J., whereby local consumer and merchant groups adopted a program of informative labeling on one line of silk hosiery. Important distributors in the general merchandise field inaugurated or intensified programs of informative labeling based on the Council's recommendations. A meeting devoted to the subject of how consumers and business may co-operate in the defense program was attended by 250 representatives of consumer groups and industries. Publications of the year included *Informative Labeling*, *Informative Selling*, and *A Plan for Cooperation Between Consumers and Local Retailers*. The annual dinner meeting will be held in October, 1941, in New York City.

**Consumers League, National**, founded in 1899 to awaken consumer responsibility for conditions under which goods are made and distributed, and through investigation, education, and legislation to promote fair labor standards. Membership: 15,000, including State and National Leagues. President: Josephine Roche. Chairman of the Board of Directors: John Howland Lathrop. General Secretary: Mary Dublin. Headquarters, 114 East 32 Street, New York City.

**Consumers' Research, Inc.**, founded as the Consumers' Club in 1927 and incorporated in 1929 to provide unbiased information and counsel on goods bought by the ultimate consumer. Number of subscribers 60,000. President and Technical Director: E. J. Schlitz. Secretary: Clark C. Willever. Headquarters: Washington, N.J. *The Annual Cumulative Bulletin*, issued in September, 1940, listed over 4000 products by brand name as *Recommended*, *Intermediate*, and *Not Recommended*, and included basic reference data on consumer problems. An analysis of 1940 automobiles was issued in January, 1940.

**Consumers Union of the United States, Inc.**, founded in 1936 to test and report on consumer goods and services. Membership: 85,000. President: Colston E. Warne. Director: Arthur Kallet. Headquarters: 17 Union Square West, New York City. A two-day conference on "Science in the Service of the Consumer" was held at Massachusetts State College, June 17-18, 1940. The 1941 annual meeting will be held at the University of New Hampshire in the spring.

**Contractors of America, Inc., The Associated General**, listed under *General*.

**Control of Cancer, Inc., The American Society for**, founded in 1913 to save lives from cancer by collecting and disseminating knowledge, and to co-operate with medical groups in raising funds for indigent patients or other projects. The Society does not treat patients, nor administer hospitals, clinics, or laboratories. Membership: 700. President: Dr. John J. Morton, Jr. Secretary: Dr. Frank E. Adair. Headquarters: 350 Madison Avenue, New York City. During 1940 prizes totalling \$1875 were awarded in a poster competition. April was set aside by Congressional Resolution as Cancer Control Month, and a nationwide educational and money-raising campaign was organized and directed by the Women's Field Army of the Society. More than 175,000 women were enlisted in the Army, 10,000 lectures were delivered, 3,000,000 leaflets distributed, and 900 radio broadcasts presented. A two-reel film "Choose to Live," prepared in co-operation with the U. S. Public Health Service, was released in April and seen by an estimated 6,000,000 people during the year. The 1941 meeting is scheduled, March 1, in New York City.

**Cooperative Alliance, International.** See CO-OPERATIVE MOVEMENT.

**Cooperative League of the USA, The,** founded in 1916 as a national educational federation of consumer co-operatives devoted to the extension of the consumer co-operative movement through organization and operation of consumer-owned business enterprises. Membership: 1,115,000 members in 18 affiliated regional associations. President Dr. James P. Warbasse. General Secretary: E. R. Bowen. Headquarters: 608 S. Dearborn Street, Chicago, Ill., 167 West 12 Street, New York City; 726 Jackson Place, Washington, D.C. The 12th Biennial Congress and Silver Anniversary celebration of the founding of the League was held in Chicago, Oct. 16-18, 1940. The Washington office was opened in July. See CO-OPERATIVE MOVEMENT.

**Co-operatives.** See also under *Farmer Co-operatives and Farmers' Educational and Co-operative Union*; and the article on CO-OPERATIVE MOVEMENT.

**Cost Accountants, National Association of,** founded in 1919 for the advancement of the science of industrial accounting and the mutual self-betterment of its members. Membership: 10,000. President: V. H. Stempf. Secretary and Business Manager: S. C. McLeod. Headquarters: 385 Madison Avenue, New York City. The 1941 annual meeting will be held in New York in June.

**Cotton Manufacturers, National Association of,** founded in 1854 for service to cotton mills in the northeastern section of the United States. Membership: about 450. President: Russell T. Fisher. Headquarters: 80 Federal Street, Boston, Mass. Student Honor Medals were awarded in various textile schools in 1940.

**Credit Union National Association,** founded in 1934 to organize and service credit unions in the United States and Canada. Membership: 46 State leagues serving 2,500,000 members. President: William Reid. Managing Director: Roy F. Bergengren. Headquarters: 1342 E. Washington Street, Madison, Wis. During 1940 the Association acquired a five-acre tract on Lake Mendota, Madison, Wis., on which a national headquarters building will be erected by public subscription as a memorial to the late Edward A. Filene, founder of the credit union movement in the United States. Canadian credit unions were accepted to membership in 1940, and 1400 new unions were organized. The seventh annual meeting will be held in Jacksonville, Fla., May 1-3, 1941.

**Cruelty to Animals, The American Society for the Prevention of,** listed under *Prevention*.

**Daughters of the American Revolution, National Society,** founded in 1890 for historical, educational, and patriotic purposes. Membership: 143,115 in 2545 chapters. President General: Mrs. Henry M. Robert, Jr. Headquarters: Memorial Continental Hall, Washington, D.C. During 1940 the Society celebrated its Golden Jubilee with individual anniversary projects in hundreds of chapters. The regular program included work for the advancement of American music (begun in 1938), training for the foreign-born and reduction of illiteracy, aid to poor children and the elderly (through contributions of \$110,000 in two years), reforestation activities in co-operation with the U.S. Forest Service, education in the correct use of the flag, maintenance of a library and museum, and historical and genealogical research. Two schools are maintained by D.A.R. funds. In 1940, 356 girls and 209 boys received loan scholarships in institutions upholding American principles. During the past two years 682,492 copies of the *Manual for Citizenship* were distributed. A D.A.R. National Preview committee in New York evaluates motion pictures, and a list of pictures of merit is published in the *National Historical Magazine*. In 1939 and 1940, 4623 programs and 1615 hours of broadcasting were given over 607 different stations, furthering the historical and educational activities of the Society. The Fifth Continental Congress will be held in Washington, D.C., April 14-18, 1941.

**Defend America by Aiding the Allies, Committee to,** founded in 1940 to promote the necessary legislation and executive action to insure effective aid to Britain and other countries defending themselves against aggression. Membership: 603 national members and 780 local chapters. National Chairman Ernest W. Gibson. National Director: Clark M. Eichelberger. Headquarters: 8 West 40 Street, New York City. The organization seeks to mobilize public sentiment in support of Great Britain and her allies.

**Dental Association, American,** founded in 1859 for educational purposes. Membership: about 49,000. President: Oren A. Oliver. Executive Secretary: Gerald D. Timmons. Headquarters: 212 E. Superior Street, Chicago, Ill. A Centennial Meeting was held in Cleveland, Ohio, Sept. 9-13, 1940. The 1941 meeting will be held in Houston, Tex. See DENTISTRY.

**Dietetic Association, The American,** founded in 1917 to bring about closer co-operation among dietitians and between dietitians and workers in allied fields, and to improve conditions and raise the standard of dietary work. Membership: 4600. President: Nelda Ross. Headquarters: 185 N. Wabash Avenue, Chicago, Ill. A program in connection with defense was begun in 1940. The 1941 meeting will be held in St. Louis, October 20-24.

**Economic Association, American,** founded in 1885 to

encourage research and freedom of discussion and issue publications. Membership: 3097 members; 1318 subscribers. Headquarters: Northwestern University, Evanston, Ill. The annual meeting in New Orleans, Dec. 27-30, 1940, was devoted to current vital problems in retrospect and prospect; e.g. the Federal budget, Deficit Financing, the price level and the gold problem, the role of private investment, and economic consequences of the war. A special session commemorated the semicentennial of Alfred Marshall's *Principles*.

**Economic Entomologists, American Association of,** founded in 1889 to promote the study and to advance the science of entomology, and to publish the *Journal of Economic Entomology*, etc. Membership: 1320. President: J. R. Parker. Secretary: Ernest N. Cory. Headquarters: College Park, Md. The Eastern Branch of this Association awarded a medal and cash prize during 1940 to Raimon L. Beard for a paper entitled "The parasitic castration of *Anasa tristis* Deg. by *Trichopoda pennipes* Fabr. and its effect on reproduction." The golden jubilee was celebrated in December, 1939. The 1941 meeting will be held in San Francisco, December 27-31.

**Economic Research, National Bureau of,** founded in 1920 to encourage investigation, research, and discovery, and the application of knowledge to the well-being of mankind; and in particular to conduct exact and impartial investigations in the field of economic, social, and industrial science. Membership: 27 members of the Board of Directors. President: W. L. Crum. Headquarters: 1819 Broadway, New York City. Nine publications were issued in 1940 dealing with finance companies, consumer credit, credit practices, manufacturing output, etc.

**Economy League, The National,** founded in 1932 as a patriotic, national, non-partisan organization advocating sound Federal finance. Membership: 3500. Chairman: Ernest Angell. Executive Director: H. G. W. Sundlof. Headquarters: 280 Madison Avenue, New York City.

**Education.** See also the societies listed under *Adult Education, International Education, Kindergarten Association, Progressive Education*. For accrediting associations, see the article on UNIVERSITIES AND COLLEGES.

**Education, American Council on,** a council of national educational associations, organizations having related interests, approved educational institutions, State departments of education, and city school systems, founded in 1918 as a center of co-operation and co-ordination in the field of education. Membership: 500 organizations and institutions. President: George F. Zook. Chairman: Henry W. Holmes. Secretary: George D. Stoddard. Headquarters: 744 Jackson Place, N.W., Washington, D.C. Education and the national defense claimed the first interest of the Council in 1940. Special committees and an added staff member (Francis J. Brown of New York University) were appointed to keep in touch with swiftly moving government procedures and to serve as a clearinghouse of information to members. High officials of the War Department, the Navy Department, the Advisory Commission to the Council on National Defense, the National Resources Planning Board, and others were kept informed concerning educational resources, both of personnel and facilities. That is also true of members of the Senate and the House as legislation proceeded through conference to enactment. Frequent conferences of Council officers with government officials contributed to laws and regulations so fashioned that as far as possible the best interests of education have been conserved. The Council sought the judgments of educators in all quarters of the country and made these judgments known to officials responsible for government policy. By means of bulletins, letters, and conferences, the Council kept educators informed concerning the plans of government as those plans were being formulated. The work of the standing committees was continued during the year. The annual meeting will be held in Washington, D.C., in 1941. See EDUCATION.

**Education Association of the United States, National (NEA),** founded in 1857 to advance the interests of the teaching profession, promote the welfare of children, and foster the education of all the people. Membership: 203,429. President: Donald DuShane. Executive Secretary: Willard E. Givens. Headquarters: 1201 Sixteenth Street, N.W., Washington, D.C. A National Committee on Education and Defense was created in 1940, and offices of the following departments were established in the NEA building: National Association of Secondary School Principals; National Council for the Social Studies; American Association for Health, Physical Education and Recreation; and Classroom Teachers. Through the Activity of the Committee on Induction into Citizenship Congress named the third Sunday in May as Citizenship Recognition Day. The Personal Growth Leaflets were developed. The 1941 annual meeting will be held in Boston, June 29-July 3. See EDUCATION.

**Education by Radio, National Committee on,** founded in 1930 to act as spokesman for organized education, to act as a clearinghouse for information about educational broadcasting, and to promote the educational use of radio and co-operative radio councils. Membership: nine representatives of constituent organizations. Chairman: Dr.

Arthur G. Crane. Secretary: S. Howard Evans. Headquarters: 1 Madison Avenue, New York City.

**Electrical Engineers, American Institute of**, founded in 1884 for the advancement of the theory and practice of electrical engineering and allied subjects and maintenance of high professional standards. Membership: 17,916. Headquarters: 33 West 39 Street, New York City. The Lamme Medal was awarded in 1940 to Norman Wilson Storer for work in electrical traction. The 1941 national conventions will be held in Philadelphia, January 27-31; Toronto, June 16-20, and Yellowstone National Park, August 27-29.

**Elks, Benevolent and Protective Order of**, fraternal organization founded in 1868. Grand Exalted Ruler: Joseph G. Buch. Grand Secretary: J. Edgar Masters. Headquarters: Elks National Memorial Building, Chicago, Ill. A Commission of National Defense and Public Relations was appointed by the Grand Lodge in 1940 to co-operate in any national crisis. The 1941 annual Grand Lodge Session will be held in Philadelphia.

**Emergency Peace Mobilization.** See COMMUNISM.

**Engineering Societies.** See under *Civil Engineers, Electrical Engineers, Engineers, Mechanical Engineers, Mining and Metallurgical Engineers*

**Engineers, American Society of**, founded in 1912 to centralize all engineers in a single representative body. Membership: 22,950. President: Fred Gross. Acting Secretary: W. A. Card. Headquarters: Gross Building, Berwyn, Ill. The 1941 meeting will be held in Chicago, June 30.

**English Institute, The**, founded in 1939 to afford an opportunity for mature scholars in the field of English to meet together in a series of informal conferences and discuss questions of literary and philological research. In 1940 the Conferences were attended by 103 persons. Chairman: Prof. George Sherburn. Secretary: Prof. Rudolf Kirk, Rutgers University, New Brunswick, N.J. The second annual meeting of the Institute, in 1940, was marked by the appearance of the first number of the *English Institute Annual*, composed of papers from the first session. The 1941 session is to be held, September 8-13, at Columbia University, New York City.

**English-Speaking Union**, founded in 1920 to draw together in the bond of comradeship the English-speaking people of the world. Membership: about 15,000. Headquarters: 30 Rockefeller Plaza, New York City. Activities in 1940 included the Lord Lothian Dinner, a Geneva Benefit, Sir Evelyn Wrench's tour through the United States, adoption of Nonesuch Towns and Destroyers, establishment of an Overseas Children's Committee and a Mothers Club, and a Gracie Fields Concert.

**Engraving, American National Committee of.** See PRINTS

**Entomologists, American Association of Economic**, listed under *Economic*

**Ethers, Society of American.** See PRINTS

**Ethnological Society, American**, founded in 1842. The Society meets regularly for lectures and discussions of scientific work and problems in anthropology, and publishes a series of monographs. Membership: 247. President: Prof. Wm. D. Strong. Secretary: Dr. Cora Du Bois. Headquarters: American Museum of Natural History—New York Academy of Sciences

**Eugenics Society, Inc., American**, founded in 1926 to improve the quality of future citizens through formulation of eugenic policies, public education, and encouragement of research. Membership: 650. President: Dr. Maurice A. Bigelow. Secretary: Rudolf C. Bertheau. Headquarters: RKO Building, Rockefeller Center, New York City. The 1941 spring Conference will be held April 15-16.

**Farmer Co-operatives, National Council of**, founded in 1929 to promote the interests of and serve as a conference body for farmers' co-operatives. Membership: 55. Direct and associate organizations. President: John D. Miller. Executive Secretary: Ezra T. Benson. Headquarters: 1731 I Street, N.W., Washington, D.C. The 1941 meeting was scheduled for Washington, D.C., January 8-10.

**Farmers, Associated.** See CALIFORNIA

**Farmers' Educational and Co-operative Union of America**, founded in 1902 to secure equity, establish justice, and apply the Golden Rule. Membership: about 90,000, not including honorary members. President: James G. Patton. Secretary: J. M. Graves. Headquarters: 18 N. Klein Street, Oklahoma City, Okla. The National Convention was held at Denver, Colo., Nov. 18-20, 1940.

**Farmers of America, Future.** See EDUCATION, U.S.

#### OFFICE OF

**Fashion Group.** See FASHION EVENTS

**Federal Union, Inc.** See UNION NOW

**Fellowship Forum, American.** See DIS COMMITTEE

**Fire Protection Association, National**, founded in 1896 to promote the science and improve the methods of fire protection and prevention, to obtain and circulate information, and to secure the co-operation of its members in establishing safeguards against fire loss. Membership: 5010. President: Alvah Small. General Manager: Percy Dughee. Headquarters: 60 Battery March Street, Boston, Mass. See FIRE PROTECTION.

**Fire Underwriters, National Board of**, an educational, factual, and engineering organization founded in 1866 and supported by the capital stock fire insurance business.

Membership: 195. President: F. D. Layton. General Manager: W. E. Mallalieu. Headquarters: 85 John Street, New York City. The 1941 meeting will be held May 22 in New York City. See FIRE PROTECTION; INSURANCE.

**Foreign Born, American Committee for Protection of**, listed under *Protection*.

**Foreign Policy Association, Inc.**, founded in 1918 to carry on research and educational activities to aid in the understanding and constructive development of American foreign policy. Membership: 18,400. President: Frank Ross McCoy. Secretary: Dorothy F. Leet. Headquarters: 22 East 38 Street, New York City. The Association publishes a weekly *Bulletin* including the *Washington News Letter*; semi-monthly *Foreign Policy Reports* and *Pan American News*, and *Headline Books*. The annual meeting will be held in October, 1941. Discussion luncheons are scheduled periodically at the Hotel Astor, New York City.

**Foreign Relations, Inc., Council on**, founded in 1917 to study the international aspects of America's political, economic, and financial problems. Membership: 500. President: Norman Davis. Executive Director: Walter H. Mallory. Headquarters: 45 East 65 Street, New York City. The Council publishes a quarterly review, *Foreign Affairs*, and two annuals, *The United States in World Affairs* by Shephardson and Scroggs and *The Political Handbook of the World*.

**Foresters, Society of American**, founded in 1900 to represent, advance, and protect the interests and standards of the profession of forestry and to provide a medium for the exchange of professional thought. Membership: 4708. President: Dr. Clarence F. Korstian. Executive Secretary: Henry E. Clepper. Headquarters: Mills Building, Washington, D.C. The 40th anniversary of the founding of the Society was observed at a meeting of 550 members and guests, held in Washington, D.C., Dec. 19-21, 1940. The 1941 meeting will be held in Jacksonville, Fla., December 18-20.

**Forestry Association, American**, founded in 1875 for the advancement of intelligent management and use of the country's forests and related resources of soil, water, wildlife, and outdoor recreation. Membership: 14,000. President: W. S. Rosecrans. Executive Secretary: Ovid Butler. Headquarters: 919-17th Street, N.W., Washington, D.C. The 1941 meeting will be held in Los Angeles, April 15-17.

**Fraternal Congress of America, National**, founded in 1886 to unite all fraternal benefit societies of America for mutual improvement and concert of action. Membership: 86 societies. President: Alexander O. Benz. Manager: Foster F. Farrell. Headquarters: 35 E. Wacker Drive, Chicago, Ill. The 1941 meeting will be held September 22-25.

**French Chamber of Commerce of the United States, Inc.**, founded in 1896 to foster commercial relations between France and the United States. Membership: about 1000. President: Pierre C. Cartier. Executive Secretary: Firmin Guégo. Headquarters: 5 East 52 Street, New York City. The annual meeting was scheduled, Jan. 30, 1941.

**Future Farmers of America.** See EDUCATION, U.S.

#### OFFICE OF

**Garden Club of America**, founded in 1913. Membership: about 8000. Secretary: Mrs. Hermann G. Place. Headquarters: 598 Madison Avenue, New York City. The 1941 meeting will be held in Rochester, N.Y., in May.

**Gas Association, American**, founded in 1918 by holding companies, gas operating companies, manufacturers of gas appliances and equipment, and individuals. Membership: 5300. President: T. J. Strickler. Managing Director: Alexander Forward. Headquarters: 420 Lexington Avenue, New York City. In 1940 the Charles A. Munroe Award was granted to Herman Russell, President of the Rochester (N.Y.) Gas and Electric Corporation, and the Beal Medal to Raymond F. Hadley of Philadelphia for his paper, "Studies in Microbiological Anaerobic Corrosion." The 1941 annual convention will meet in Atlantic City in October, and the Natural Gas Section at Dallas, May 5-8. See GAS INDUSTRY.

**General Contractors of America, Inc., The Associated**, a trade association founded in 1918. Membership: 2535. President: M. W. Watson. Managing Director: H. E. Foreman. Headquarters: Munsey Building, Washington, D.C. The annual convention will be held at Houston, Texas, Feb. 17-20, 1941. A G.C. members performed a large portion of the National Defense Construction Program initiated in 1940.

**Geographical Society, American**, a research institution founded in 1852. Membership: 3101. President: Roland L. Redmond. Director: Dr. John K. Wright. Headquarters: Broadway at 156 Street, New York City. During 1940 the Society published *Inner Asian Frontiers of China* by Owen Lattimore; *Environment and Conflict in Europe: Eighteen Basic Maps*, and nine sheets of the great map of Hispanic America, bringing the number to 97 out of a total of 107 sheets. The Cullum Geographical Medal for 1940 was awarded to Dr. Robert Cushman Murphy and the Charles P. Daly Medal to Prof. Carl O. Sauer.

**Geographical Society, Royal**, founded in 1830 for the advancement of geographical science. Membership: circa

6000. President: Field Marshal Sir Philip Chetwode. Secretary: Arthur R. Hinks. Headquarters: Royal Geographical Society, Kensington Grove, London, S.W. 7. The Founder's Medal was awarded in 1940 to Mr. and Mrs. Harold Ingrams, the Patron's Medal to Lieut. Alexander R. Glen, and the Victoria Medal to Mr. O. G. S. Crawford. The Society publishes the monthly *Geographical Journal*, technical publications, and maps.

**Geographic Society, The National**, founded in 1888 for the increase and diffusion of geographic knowledge. Membership: 1,100,000. President: Gilbert Grosvenor. Secretary: George W. Hutchison. Headquarters: 1146 Sixteenth Street, Washington, D.C. During the year The Society co-operated with the Smithsonian Institution in sending an archeological expedition to the States of Veracruz and Tabasco, Mexico. Under the leadership of Matthew W. Stirling, the party uncovered five colossal heads and other monuments of a great pre-Columbian civilization. Dr. Joseph P. Connolly and James D. Bump served as leaders of the National Geographic Society-South Dakota School of Mines paleontological expedition to the Badlands of South Dakota. See *EXPLORATION*. Dr. Irvine C. Gardner led the National Geographic Society-National Bureau of Standards eclipse of the sun expedition to Patos, Brazil. On October 1, a program of tests with radio signals to determine the behavior, during total eclipses, of ionized layers in the upper atmosphere was successfully completed. Photographs were made of the four times of apparent contact of the sun and moon, of the inner corona, and of the flash spectrum. In addition to its official publication, the *National Geographic Magazine*, the Society published "An Initial Series from Tres Zapotes, Veracruz, Mexico," a monograph in its series of *Contributed Technical Papers*.

**German-American Bund**. See *DISE COMMITTEE*; *FASCISM*.

**Girl Scouts, Inc.**, founded in 1912 to help girls develop as good citizens and resourceful people through group self-government and activities in the following fields: home-making, arts and crafts, nature, the out-of-doors, literature and dramatics, community life, international friendship, sports and games, health and safety, music and dancing, and vocational exploration. Membership: 628,948. President: Mrs. Harvey S. Mudd. National Director: Mrs. Paul Rittenhouse. Headquarters: 14 West 49 Street, New York City. Girl Scout Anniversary Week was celebrated March 12-18, 1940, and Girl Scout Week, October 27 to November 2. The Western Hemisphere Encampment (August 14-18) was attended by 22 girls from American countries outside the United States and by 82 girls from the United States. In the summer of 1940 the Girl Scout national headquarters suggested that all local Girl Scout groups co-ordinate their service and citizenship activities by setting up special citizenship bureaus. Many councils have established such bureaus and Girl Scouts throughout the country are renewing their traditional emphases on practical citizenship problems and preparation for any emergency. The 1941 convention will be held at Dallas, Tex., October 19-25.

**Governors' Conference**. See under *State Governments* below.

**Grange, The National**, an Order formed in 1867 to give to the American farmer better social and educational opportunities, economic betterment, and higher spiritual and patriotic idealism. Membership: 800,000. Master: Louis J. Taber. Secretary: Harry A. Caton. Headquarters: Peoples Life Building, Washington, D.C., and 970 College Avenue, Columbus, Ohio. During 1940 the Grange added 400 Juvenile, Subordinate, and Pomona Granges and a new State Grange in Wyoming, making a total of 8000 Subordinate Granges and 37 organized States. In legislation it was active in supporting the Truth-in-Fabrics Bill, the Walter Logan Bill, and legislation to promote national defense. Accomplishments in co-operative activities added to the farmer's income through patronage, dividends, and better prices. The National Grange Session will convene at Boston, Mass., in 1941, the Diamond Jubilee year of the organization.

**Group Health Association**. See *MEDICINE AND SURGERY*.

**Hadassah, Inc.**, The Women's Zionist Organization of America, founded in 1912 to foster Zionist ideals in America through Jewish education and to conduct activities in Palestine which include promotion of public health, land redemption and afforestation, and immigration and colonization through Youth Aliyah. Membership 94,000. President: Mrs. David de Sola Pool. Executive Secretary: Miss J. N. Leibel. Headquarters: 1860 Broadway, New York, N.Y. Events of 1940 included contributions to the Jewish National Fund in January and the celebration of Hadassah's 28th birthday, the 80th birthday of Theodore Herzl founder of Zionism, and the birthday of Miss Henrietta Szold, Honorary President. Membership week was observed November 8-15 and National Education Day at Hunter College, New York City, December 3. The 29th Annual Convention will be held in October, 1941.

**Health**. See under *Group Health*; *Public Health*.  
**Henry George School of Social Science**, founded in 1933 to teach the philosophy of Henry George. Membership: hundreds of volunteer instructors throughout the

country and over 20,000 graduates. Director: Frank Chodorov. Headquarters: 30 East 29 Street, New York City. Classes are held, not only in the headquarters building, but in public buildings, Y.M.C.A. and church buildings, homes, offices, etc.; 3000 students were graduated in 1940.

**Highway Users Conference, National**, a fact-finding, information-giving, co-ordinating agency of national groups of motor vehicle users, founded in 1932 to bring about taxation and regulation policies that will insure to the public the maximum benefits of highway facilities. Membership: 27 national organizations. President: Alfred P. Sloan, Jr. Director: Chester H. Gray. Headquarters: 938 National Press Building, Washington, D.C.

**Hispanic Society of America**. See separate article.

**Holland Society of New York**, founded in 1885 for historical and genealogical work. Membership: limited to 1000 annual members. President: Arthur R. Wendell. Secretary: Frank H. Vedder. Headquarters: 90 West Street, New York City. At the annual banquet, Nov. 14, 1940, a gold medal was awarded to Henry Ford for eminence in scientific manufacturing beneficial to all mankind. The 1941 annual meeting will be held April 7.

**Home Economics Association, American**, organized in 1908 for development and promotion of standards of home and family life that will best further individual and social welfare. Membership: 15,180 individuals, 2345 student clubs, and six groups of homemakers. President: Gladys Branagan. Executive Secretary: Edna Van Horn. Headquarters: 620 Mills Building, Washington, D.C. During 1940 the Association adopted a basic platform for consumer-business relations, and undertook to compile a complete directory of home-economics trained women for use in emergency service. Progress was made in a program to promote standardization of and specification for consumer goods and to encourage the use of informative selling. Six international fellowships were awarded to young women from Argentina, China, and Peru. The Borlen Award was granted to Dr. Henry C. Sherman. The 1941 meeting will be held in Chicago, June 22-26.

**Hospital Association, American**, founded in 1899 to promote the welfare of the people through the development of hospital and out-patient service. Membership: 2854 institutions and 2296 individuals. President: Dr. Basil C. MacLean. Treasurer: Asa S. Bacon. Headquarters: 18 Division Street, Chicago, Ill. In 1940 the Award of Merit was granted to Dr. S. S. Goldwater. The National Hospital Day Certificates of Award went to St. Luke's Hospital, Milwaukee, Wis., and the Goldsboro Hospital, Goldsboro, N.C. The 43d Annual Convention will be held Sept. 15-19, 1941, in Atlantic City, N.J.

**Housing Conference, National Public**, listed under *Public*.

**Humane Association, The American**, founded in 1877 for the prevention of cruelty to children and animals. Membership: 11,000. President: Sydney H. Coleman. General Manager: Eric H. Hansen, 135 Washington Avenue, Albany, N.Y. The 13th annual Humane Trap Contest, held in 1940, brought in 150 entries. A poster and a photographic contest were also conducted. The 1941 meeting will be held in Hollywood, Calif., October 20-24.

**Hygiene**. See under *Mental Hygiene*; *Social Hygiene*.  
**Industrial Conference Board, Inc.**, The National, founded in 1916 for scientific research, professional education, practical service, and public information in the field of business economics and business management. President: Dr. Virgil Jordan. Secretary: Fairfield E. Raymond. Headquarters: 247 Park Avenue, New York City.

**Industrial Democracy, League for**, founded in 1905 with the purpose of education for a new social order based on production for use and not for profit. Membership: 2000. President: John Dewey. Executive Director: Harry W. Laidler. Headquarters: 112 East 19 Street, New York City. The League celebrated its 35th anniversary in New York, Nov. 28, 1940. Meetings scheduled in 1941 include a conference on Defense of Living Standards, February 15, and a June Conference in New York.

**Industrial Relations Counselors, Inc.**, established in 1926 to advance the knowledge and practice of human relationships in industry, commerce, education, and government. Director: T. H. A. Tiedemann. Headquarters: 1270 Sixth Avenue, New York, N.Y. The organization conducts research, offers a consulting service, mainly for industrial corporations, and maintains a specialized industrial-relations library and an information service. Fifteen volumes and four monographs were published by the close of 1939.

**International Education, Institute of**, a non-membership organization, founded in 1919 to increase international understanding through interchange of students, circuiting of lecturers, teacher and librarian exchanges, and publication of books, pamphlets, and a *News Bulletin*. The Institute serves as a general clearing house of information in its field. Director: Stephen Duggan. Headquarters: 2 West 45 Street, New York City. For the academic year 1940-41, 220 fellowships and scholarships were awarded for study at United States colleges and universities and 28 for Americans at foreign universities. Events of 1940 included expansion of cultural relations with Latin America and increased assistance for displaced foreign scholars.

**Investment Bankers' Association.** See **FINANCIAL REVIEW** under *Financial Regulation*.

**Iron and Steel Institute, American,** founded in 1908 to promote the interests of the industry. Membership: about 1800. President: Walter S. Tower. Secretary: G. S. Rose. Headquarters: 350 Fifth Avenue, New York City. The Institute's medal was awarded in 1940 to James E. Loe, Vice-President of the Carnegie-Illinois Steel Corporation. The 49th General Meeting was held in New York, May 23, 1940.

**Jewish Welfare Board.** See separate article.

**Junior Leagues of America, Inc., Association of the,** founded in 1921 to unite the 150 local Junior Leagues and through them to educate their members for effective volunteer service in community agencies and for shaping social programs. Membership: 34,000. President: Mrs. George V. Ferguson. Executive Secretary: Mrs. DeForest Van Slyck. Headquarters: Hotel Waldorf-Astoria, New York City. The 1941 annual conference was scheduled in St. Louis, January 27 to February 1.

**Kindergarten Association, National,** founded in 1909 to help secure the advantages of kindergarten education for all the nation's children. Membership varies from 2245 to 8000. President: Maj. Bradley Martin. Executive Secretary: Miss Bessie Locke. Headquarters: 8 West 40 Street, New York City. As a result of the work done by the Association 83 new kindergartens were opened in 1940. Five new leaflets were distributed. The annual meeting is held at the national headquarters in January.

**King's Daughters and Sons, International Order of the,** in 1886 "for the development of spiritual life and stimulation of Christian activities." Membership: 53,446. President: Mrs. Henry S. Eley. Secretary: Mrs. Claude E. Leher. Headquarters: 144 East 37 Street, New York City. The General Convention met in Oakland, Calif., in June, 1940. The next meeting is scheduled to be held in Jackson, Miss., in 1942. The Central Council will meet in Chautauqua in August, 1941.

**Kiwanis International,** founded in 1915 to unite community leaders in each business and profession for civic, social, and welfare service to their towns. Membership: 110,000 (2131 clubs). President: Mark A. Smith. Acting Secretary: George W. Kimball. Headquarters: 520 N. Michigan Avenue, Chicago, Ill. The organization observed its 25th anniversary in 1940. Over 29,000 community service activities were completed in the fields of aid to underprivileged children, vocational assistance, urban-rural relations, conservation, safety, aid to youth, etc. The 1941 annual convention will be held in Atlanta, June 15-19.

**Knights of Pythias,** a fraternal organization founded in 1864. Membership: 350,000. Supreme Chancellor: Ray O. Garber. Headquarters: 1054 Midland Bank Building, Minneapolis, Minn. The Supreme Lodge meets biennially, the next meeting being in 1942.

**Ku Klux Klan, Inc., Knights of the,** founded in 1915 to organize a solid block of native-born, white, Protestant, Gentile Americans for the purpose of promoting under oath the following principles: the tenets of the Christian religion; white supremacy; protection of pure womanhood; just laws and liberty, closer relationship of pure Americanism; upholding of the Constitution of the United States; sovereignty of State rights; separation of Church and State, freedom of speech and press; closer relationships between Capital and Labor, preventing the causes of mob violence and lynchings, preventing unwarranted strikes by foreign labor agitators; prevention of fires and destruction of property of lawless elements; limitation of foreign immigration; much needed local reforms; law and order. Membership: over 5,000,000. Imperial Wizard (President): James Arnold Colcott. Imperial Kligrapp (Secretary): James M. George. Headquarters: 3155 Roswell Road, Atlanta, Ga. In 1940 Klan leaders who refused to drop anti-practices and adhere to the program of pro-Americanism were eliminated. A unified national program, as announced by the Imperial Wizard in June, 1939, was adopted. See **FASCISM**; **GEORGIA**.

**Labor Legislation, American Association for,** an organization of socially minded economists, lawyers, journalists, labor leaders, and employers, founded in 1906 to attack needless industrial evils from the general welfare viewpoint. It functions as the American arm of the International Association for Social Progress, formed in 1925. President: Joseph P. Chamberlain. Secretary: John B. Andrews. Headquarters: 131 East 23 Street, New York City. In 1940 a special report on Labor Law Administration in North Carolina was issued, and the quarterly *American Labor Legislation Review* completed its 30th year of publication. The 34th Annual Meeting was held in Chicago, Dec. 27-30, 1940, several sessions being held jointly with the American Political Science Association, the American Statistical Association, and the American Sociological Society. See **LABOR LEGISLATION**.

**Law Institute, The American,** founded in 1923 to promote the clarification and simplification of the law and its better adaptation to social needs, to secure the better administration of justice, and to encourage and carry on scholarly and scientific legal work. Membership: 750. President: George Wharton Pepper. Director: William Draper Lewis. Headquarters: 3400 Chestnut Street, Philadelphia,

Pa. The annual meeting will be held in Washington, D. C., May 6-9, 1941. See **CHILDREN'S BUREAU**; **PRISONS, PAROLE, AND CRIME CONTROL**.

**League of Nations Association, Inc.,** founded in 1923 to teach the need for the co-operation of all nations in building an international organization as the essential basis of peace. Membership: 10,000. President: Dr. Frank G. Boudreau. Director: Clark M. Elchelberger. Headquarters: 8 West 40 Street, New York, N.Y. During 1940 the Association co-operated with the Commission to Study the Organization of Peace in a series of 15 weekly broadcasts over CBS, entitled "Which Way to Lasting Peace?" and in simultaneous student discussions of issues raised in the programs, awards were given for the best recommendations sent by study groups. The 14th national high school examination contest was held Apr. 12, 1940; 1210 schools competed and a first prize of \$500 was awarded in lieu of the usual trip to Europe.

**Legal Aid Organizations, National Association of,** founded in 1911 as a central body to promote legal aid work and organizations, and to co-operate with the judiciary, the bar, and all organizations interested in the administration of justice. Membership: 48 organizations. President: John S. Bradway. Secretary: Emery A. Brownell. Headquarters: 25 Exchange Street, Rochester, N.Y. During 1940 new legal aid organizations were established in Plainfield, N.J., Portland, Me., Stockton, Calif., and Vancouver, B.C. Other important events included the formation of a Committee on Legal Aid Teaching by the Association of American Law Schools and formation of a Legal Aid Clinic at Vanderbilt University, Nashville, Tenn. Publications of the year pertained to forms of organizations and legal aid records and standards, and included also a bibliography.

**Legion of Decency, National,** founded in 1934 to review and morally evaluate current entertainment motion pictures. Membership of the Episcopal Committee on Motion Pictures: 5. Executive Secretary: The Rev. John J. McClafferty. Headquarters: 485 Madison Avenue, New York City.

**Legislators' Association, American.** See under *State Governments* below.

**Library Association, American (A.L.A.),** founded in 1876 to provide complete and adequate library coverage for the United States and Canada. Membership: 16,000. President: Charles H. Brown. Executive Secretary: Carl H. Milam. Headquarters: 520 N. Michigan Avenue, Chicago, Ill. During 1940 the association was reorganized through revision of its constitution and by-laws. It directed a Rockefeller Foundation grant for a three-year project providing American books for selected popular libraries in Denmark, Eire, England, Finland, France, the Netherlands, Norway, Sweden, and Switzerland, and a grant for a three-year project covering work and studies on library co-operation with Latin-America; adopted a policy statement on "Libraries and the war in Europe"; co-operated with other groups in behalf of national defense and democracy; increased library service through help from State and national aid; issued two new quarterly *College and Research Libraries* and *The Hospital Book Guide* along with many professional bulletins, books, and pamphlets and book lists, continued work for Federal aid legislation; conducted several library surveys; and administered various foundation grants of funds for books, libraries and library training in United States and Canada. The Newbery Award was granted in 1940 to James Daugherty for *Daniel Boone*; Caldecott Award to Ingri and Edgar Parin d'Aulaire for *Abraham Lincoln*; Library Publicity Honor Roll to 52 libraries and four editors; Honorary Membership to Dr. Frank Pierce Hill and Dr. Herbert Putnam. See **LIBRARY PROGRESS**.

**Library Association, The,** founded in 1877 (incorporated by Royal Charter in 1898) to unite all persons engaged or interested in libraries, hold examinations and maintain a professional register, promote the establishment of public libraries, encourage bibliographical study, publish journals, and hold conferences. Membership: 6250. President: Arundell Esdaile. Secretary: P. S. J. Welford. Headquarters: Chaucer House, Malet Place, London, W.C.1. The Association's Carnegie Medal for an outstanding children's book published in Great Britain during 1939 was awarded to Miss Eleanor Dooley for *The Radium Woman*. Plans for the 1941 meeting were in abeyance during temporary international inconvenience.

**Lions Clubs, International Association of,** founded in 1917 as a national organization for local Lions Clubs, which are composed of representative business and professional men interested in the development of their communities. Membership: 138,000. President: Karl M. Sorrick. Secretary-General: Melvin Jones. Headquarters: 332 S. Michigan Avenue, Chicago, Ill. Activities are grouped under eight headings: boys and girls; citizenship and patriotism; civic improvements; community betterment, education; health and welfare; safety; sight conservation and the blind. Under the last-named program, 14,811 pairs of eyeglasses were donated to the needy and 7515 copies of the *Lions Juvenile Braille Magazine* were distributed. In the field of citizenship and patriotism, Lions Clubs featured in 1940 community-wide discussions, recruiting for

navy fliers and other units, co-operation with the FBI against Fifth Column activities, and establishment of National Guard units. The 25th annual convention will be held in New Orleans, July 22-25, 1941.

**Lumber Manufacturers Association, National.** See FORESTRY.

**Management Association, Inc., American,** founded by a merger of predecessor organizations in 1923 to provide executives of commercial and industrial companies with a means of exchanging information on management policies and techniques. Membership: 4000. Headquarters: 330 West 42 Street, New York City. Meetings scheduled for 1941 included the Financial Management Conference, New York City, January 22-23; Conference for Personnel Executives, Chicago, February 12-14; Packaging, Packing, and Shipping Conference, Chicago, April 1-4; Conference for Marketing and Sales Executives, New York City, April; Insurance Conference, Atlantic City, May; and meetings for Production and Office Management Executives.

**Manufacturers, National Association of (N.A.M.),** an organization of individuals, firms, and corporations engaged in manufacturing, founded in 1895 with the following general objectives: (1) the promotion of the industrial interests of the United States; (2) the fostering of the domestic and foreign commerce of the United States; (3) the betterment of the relations between employers and their employees; (4) the protection of the individual liberty and rights of employer and employee; (5) the dissemination of information among the public with respect to the principles of individual liberty and ownership of property; (6) the support of legislation in furtherance of those principles and opposition to legislation in derogation thereof. Membership: 7000. President: H. W. Prentiss, Jr. Secretary: Noel Sargent. Headquarters: 14 West 49 Street, New York City. The Association has a number of standing committees and advisory groups. The Committee on Agricultural Co-operation strives to gather unbiased, impartial facts upon which American businessmen can build a better understanding of the farm situation. The Committee on Economic Policy works in the entire basic field covered by the TNEC investigation. The Committee on Economic Security analyzes existing social security legislation and considers all new proposals, non-governmental as well as governmental, for the promotion of economic security. Under the sponsorship of the Employment Relations Committee of the N.A.M. a two weeks Institute on Employment Relations was held in conjunction with the University of Vermont in Burlington, Vt., Aug 19-30, 1940. This Committee has published *Workers over Forty, What Employees Think*, and *Model Employment Procedures*. The Committee on Study of Depressions has issued two special reports on the depression problem. The Committee on National Defense and Industrial Mobilization was formed to help the Government organize the nation's industrial resources in the interests of national defense. Under the sponsorship of the Committee on Patents and Research 19 national awards and 565 local awards were given in 1940 in the field of invention at patent dinners held in various cities of the country. In addition, the Association has been sponsoring the most widespread and complete program ever undertaken by organized industry to tell its story to the public through the National Industrial Information Committee.

**Masons.** See article on FREEMASONRY.

**Mathematical Society, American,** founded in 1888 for the promotion and publication of research in mathematics. Membership: 2300. President: Prof. Marston Morse. Secretary: Prof. J. R. Kline. Headquarters: Low Memorial Library, Columbia University, New York City. In 1940 a new international abstracting journal was established, the monthly *Mathematical Reviews*. A War Preparedness Committee was active. Meetings in 1941 will be held in New York City in February, Washington in May, and Chicago in September.

**Mayors, United States Conference of,** founded in 1932 as a clearing house for American cities on problems of municipal government. Membership: 190 cities over 50,000 in population. President: Mayor F. H. LaGuardia. Executive Director: Paul V. Betters. Headquarters: 730 Jackson Place, Washington, D.C.

**Mechanical Engineers, The American Society of,** founded in 1880 to promote mechanical engineering and allied arts and sciences. Membership: 15,000. President: William A. Hanley. Headquarters: 29 West 39 Street, New York City. The 60th anniversary of the Society was celebrated in 1940. It participated in the national defense program through public meetings devoted to ordnance manufacture discussion, committee service in research and standardization, and the assembly of records of individual members available for key positions in the defense program. At the annual meeting, Dec. 4, 1940, the A.S.M.E. Medal was awarded to Charles F. Kettering; the Holley Medal to Edwin H. Armstrong (radio communication); the Warner Medal to William Benjamin Gregory (hydraulic engineering); the Melville Medal to Carl A. W. Brandt for his paper "The Locomotive Boiler"; and the Pi Tau Sigma Award to George A. Hawkins (high-pressure steam research). Meetings are scheduled to be held

in Atlanta, Apr. 1-3, 1941; Kansas City, June 16-20; Louisville, October 12-15, and New York City (annual meeting), December 1-5.

**Medical Association, American,** founded in 1847 to promote the science and art of medicine and the betterment of public health. Membership: 117,163. President: Frank H. Lahey. General Manager: Olin West. Headquarters: 535 N. Dearborn Street, Chicago, Ill. The Distinguished Service Medal and Citation for distinguished service in the science or art of medicine was awarded, June 10, 1940, to Dr. Chevalier Jackson of Philadelphia. The Association will meet in Cleveland, Ohio, June 2-6, 1941. See MEDICINE AND SURGERY.

**Medical Association, Canadian,** founded in 1867 and interested in all matters concerning the practice of medicine. Membership: 5000. President: Gordon Fahrni. General Secretary: T. C. Routley. Headquarters: 184 College Street, Toronto, Canada. In 1940 the federation of all the Provincial Medical Associations in Canada as divisions of the Canadian Medical Association was completed. The Association will meet in Winnipeg, June 23-27, 1941.

**Mental Hygiene, Inc., The National Committee for,** founded in 1909 to promote interest and action throughout the United States in the prevention and control of mental illness and the conservation of mental health. Membership: 770. President: Dr. Adolf Meyer. Medical Director: Dr. George S. Stevenson. Associate Secretary: Paul O. Komora. Headquarters: 1790 Broadway, New York City. During 1940 the President and Medical Director became members of a planning committee to administer the Hogg Foundation, established under a grant of two and one-half million dollars to the University of Texas for mental health work in that State. The 1941 meeting of the National Committee is to be held in New York City the second Thursday in November.

**Meteorological Society, American,** founded in 1919 for the advancement and diffusion of knowledge of meteorology (including climatology) and its application to public health, agriculture, engineering, transportation, and other forms of industry and commerce. Membership about 1300. President: F. W. Reichelderfer. Secretary: Charles F. Brooks. Headquarters: Blue Hill Observatory, Milton, Mass.

**Mining and Metallurgical Engineers, American Institute of,** founded in 1871 to promote the arts and sciences connected with the production of useful minerals and metals and the welfare of those employed in these industries. Membership: 10,697. President: John R. Suman. Secretary: A. B. Parsons. Headquarters: 29 West 39 Street, New York City. The James Douglas Medal was awarded in 1940 to Louis D. Ricketts, the Lucas Medal to E. DeGolyer, the Hunt Medal to Axel Hultgren and Gosta Phragmen, and the Johnson Award to P. V. Martin. The 1941 annual meeting was scheduled February 17-20 in New York City.

**Mining Congress, The American,** founded in 1898 to advance the welfare of all branches of the mining industry, foster safer and more efficient methods of production, and represent the industry in governmental matters. Membership: 9000. President: Howard I. Young. Secretary: Julian D. Conover. Headquarters: 309 Munsey Building, Washington, D.C. The Annual Coal Convention and Exposition will be held in Cincinnati, Apr. 28 to May 2, 1941, the Metal Mining Convention and Exposition in San Francisco, Sept. 29 to Oct. 2, 1941, and the annual business meeting in Washington, Jan. 14, 1941.

**Modern Language Association of America,** organized in 1883 to promote literary and linguistic research in all the fields of the Modern Languages and Literatures. President: Karl Young. Headquarters: 100 Washington Square, New York City. During 1940 the Association published ten books. The 1941 meeting will be held in Indianapolis during the Christmas holidays.

**Modern Woodmen of America,** a fraternal life insurance society formed in 1883. It furnishes legal reserve life insurance to men, women, and Junior members. Membership: 425,000. President: Oscar E. Aleshire. Secretary: J. G. Ray. Headquarters: Rock Island, Ill. The 1941 national convention or Head Camp will be held in June.

**Museums, American Association of,** founded in 1906 to help museums solve their problems and increase their usefulness. Membership: 1100. President: Clark Wissler. Director: Laurence Vail Coleman. Headquarters: Smithsonian Institution, Washington, D.C. The Association has two major functions—long range work that shapes broadly the course of museum development and direct and immediate usefulness to museums. The former program was practically finished in the 1940 fiscal year with the publication of a three-volume critical study by Laurence Vail Coleman, *The Museum in America*, and the Association turned to the application of its years of study. Effort to add to the membership resulted in the largest income from that source in the history of the Association. A new regional group, the Washington State Museum Conference, was organized. The Carnegie Corporation increased the amount of its support for general purposes from \$10,000 to \$12,500 annually. *The Museum News* completed its 17th annual volume. In the spring of 1940, Mr. Henry W. Kent, Secretary of the Metropolitan Museum of Art, pro-

vided for an award to be made from time to time for distinguished service to the cause of museum education. The first award was made to the Association's Director at the 35th annual dinner in Detroit, May 24. The 1941 meeting will be held in Columbus, Ohio, in May.

**Music.** See organizations listed under *Advancement of Music and Composers*; also, the article on *Music*.

**Music Appreciation, National Committee for.** See *MUSIC*.

**Music Clubs, National Federation of,** founded in 1898 to bring into working relation with one another organizations and individuals associated with musical activity, to aid musical education and develop and maintain high musical standards throughout America. Membership: 4700 clubs. President: Mrs. Vincent H. Ober. Secretary: Mrs. W. A. Goforth. Publication Offices: 320 Wait Avenue, Ithaca, N.Y. The Stillman Kelley Scholarship Fund for talented children who cannot afford to study was created in 1940 and the first award was made to David Smith of Cincinnati. A plan of motion-picture awards for musicians and composers in the films was adopted, and preliminary work was done on the biennial awards of \$1000 each to three winners in Young Artist Contests. A nationwide Loyalty Through Music Crusade was launched to meet the need for rearsoused patriotism. The next biennial convention will be held in Los Angeles, June 19-25, 1941.

**Music Council, Inc., National,** organized in April, 1940, to provide a forum for the discussion of problems affecting national music life, to speak with one voice for music in the United States, to provide for an interchange of musical information, to encourage the co-ordination of the efforts of musical organizations, to conduct surveys of important problems, to encourage the development of the art of music, and to foster the highest ethical standards in it. Membership: 26 nationally active associations. President: Edwin Hughes, 338 West 89 Street, New York City. Secretary: Franklin Dunham. Meetings are to be called in New York City at least twice a year.

**Mutual Savings Banks, National Association of,** founded in 1920 to represent mutual savings banks of the United States. Membership: 12,000 officers and trustees. President: Myron F. Converse. Executive Secretary: John W. Sandstedt. Headquarters: 60 East 42 Street, New York City. The year 1941 will mark the 125th anniversary of the mutual savings bank system. At the end of 1940 these banks were serving the greatest number of depositors and holding the greatest total of deposits in their history. The annual conference of the Association will be held in Philadelphia, Apr. 30 to May 2, 1941.

**Nature Association, American,** founded in 1922 to stimulate public interest in every phase of Nature and the out-of-doors, and to further the practical conservation of the great natural resources of America. Membership: 70,000. President: Arthur Newton Pack. Secretary: Richard W. Westwood. Headquarters: 1214 16th Street, N.W., Washington, D.C. During 1940 the Association conducted and published the results of two studies: a survey of roadside conditions in Florida and a study of conservation education in the schools under a special endowment of the American Nature Association to Cornell University. Legislation of constructive character looking to the conservation of natural resources was actively supported.

**Netherland-America Foundation, Inc., of Holland House,** founded in 1921 to deepen understanding and friendship between the Netherlands and the United States through educational and cultural channels. Membership: 125. President: Thomas J. Watson. Secretary: Harold de Wolf Fuller. Headquarters: 10 Rockefeller Plaza, New York City. The annual meeting is held the third Tuesday in January. During 1940 the Foundation presented, in association with Holland House, a concert of Contemporary Dutch Music and several art exhibitions.

**Newspaper Publishers Association, American,** founded in 1887 to foster and protect the interests of the newspaper publishing business. Membership: 456. President: John S. McCarrens. Secretary: Norman Chandler. Headquarters: 370 Lexington Avenue, New York City. The 1941 meeting will be held in New York City, April 22-24.

**No Foreign War Committee,** founded in December, 1940, to keep America out of foreign war. Chairman: Verne Marshall. Treasurer: Robert A. Lancaster. Headquarters: 100 East 42 Street, New York City.

**Numismatic Society, The American,** founded in 1858 for the collection, preservation, and study of coins, medals, and decorations of all countries. Membership: 443. President: Edward T. Newell. Secretary and Curator: Sydney P. Noe. Headquarters: Museum at Broadway and 156th Street, New York City. During 1940 an exhibition was held of the collection of Architects' Medals presented to the Society by Mr. and Mrs. Robert J. Eidlitz. Meetings are held at the Museum on the second Saturday in January, April, and November.

**Nurses' Association, American,** founded in 1896 to promote the professional and educational advancement of nurses, to elevate the standard of nursing education, and to establish and maintain a code of ethics among nurses. Membership: 166,286. President: Julia C. Stimson, R.N. Secretary: Mrs. Mary A. Hickey, R.N. Headquarters: 1790 Broadway, New York City. During 1940 sections

for Men Nurses and General Staff Nurses were created, and the Association co-operated in the activities of the Nursing Council on National Defense. Studies were made in the interest of placement service and vocational counseling, organization and program of professional registries, service in small hospitals, shorter hours (with special reference to private duty nurses), and the status of subsidiary workers with regard to the care of the sick. The next Biennial Convention will be held in Chicago in May, 1942, in conjunction with the National League of Nursing Education, and the National Organization for Public Health Nursing.

**Odd Fellows, Independent Order of,** a fraternal organization founded in 1819 to relieve the distressed, bury the dead, and educate orphans. Membership: 1,406,835. Grand Sire: James A. Hagerman. Grand Secretary: Edw. G. Ludvigsen. Headquarters: 16 West Chase Street, Baltimore, Md. The 1941 meeting will be held in Des Moines, Iowa, September 15.

**Orchestral Association, National.** See *MUSIC*.

**Oriental Society, American,** founded in 1842 for the promotion of research in oriental languages and cultures and the publication of books and papers. Membership: 840. President: Dr. Arthur W. Hummel. Secretary: Prof. Ferris J. Stephens, Yale University, New Haven, Conn. The 1941 meeting will be held in Chicago, April 15-17.

**Ornithologists' Union, The American,** founded in 1883 for the advancement of its members in ornithological science, publication of a journal and other works, and acquisition of a library. Membership: 1460. President: James P. Chapin. American Museum of Natural History, New York City. Secretary: Lawrence E. Hicks. In 1940 the Brewster Award was granted to Dr. James L. Peters for his *Birds of the World*. The 1941 meeting will be held in Denver, Colo., in June.

**Ort, Women's American,** founded in 1927 and devoted to the creation of a new occupational existence for refugees and the masses of European Jews through trade-schools, farm colonies, and industrial workshops. It is affiliated with American Ort Federation and World Ort Union, which have operated training centers in Europe for the past 60 years. Membership: about 5000. President: Mrs. Edward B. Gresser. Headquarters: 212 Fifth Avenue, New York City. Events of 1940 included the Annual Donor Luncheon, May 14, and the Annual Membership Tea, December 17, in New York City. Chapter meetings are held monthly throughout cities of the United States.

**Pacific Relations, Institute of,** founded in 1925 to promote scientific investigation and rational discussion of the problems and mutual relations of the peoples of the Pacific area. Membership: 1732. Secretary-General: Edward C. Carter. Headquarters of the American Council: 129 East 52 Street, New York, N.Y. Publication of a series of books on "Inquiry into the Sino-Japanese Conflict" was continued in 1940. Round table discussions were held in Honolulu, San Francisco, Chicago, Los Angeles, and New York. A seminar program was held jointly with the Foreign Policy Association, and a study outline on "Essentials of Far Eastern Peace" was distributed among college and study groups.

**Painters and Sculptors, National Association of Women,** listed under *Women*.

**Pan American Union.** See separate article.

**Pan Pacific Union,** founded in 1917, after ten years of preliminary work by the founder Alexander Hume Ford, for the promotion of better relation in Pacific countries through a fuller knowledge of each other. Membership: 500. President: A. D. Castro of Honolulu, former Consul for Brazil. Executive Secretary: A. V. Satterthwaite. Headquarters: 1025 Union Trust Building, Honolulu. During 1940 the Union addressed a memorial to the Pacific governments seeking cessation of hostilities. Pan-Pacific or Balboa Day was observed, September 25. A meeting scheduled in New Zealand in January was postponed on account of the war, and no international meetings have been scheduled recently.

**Parents and Teachers, The National Congress of,** founded in 1897 as the National Congress of Mothers, to promote the welfare of children and youth in home, school, church, and community. Membership: 2,379,599. President: Mrs. William Kletzer. Secretary: Mrs. Charles D. Center. National Office: 600 S. Michigan Boulevard, Chicago, Ill. On Nov. 14, 1940, the organization of the Nevada Congress of Parents and Teachers brought into the National Congress the last unorganized State in the nation. A three-year program of action on "The Child in His Community" was inaugurated, based on the findings and recommendations of the 1940 White House Conference on Children in a Democracy (see *CHILDREN'S BUREAU*). The organization accepted membership on the National Co-ordinating Committee on Education and Defense.

**Peace.** See *Emergency Peace Mobilization*, *No Foreign War Committee*, *World Alliance for International Friendship*, *World Peace Foundation*, as well as the immediately following groups.

**Peace and Freedom, Women's International League for (U.S. Section),** founded in 1915. Membership: 13,000. President: Miss Gertrude C. Bussey. Secretary: Miss Grace E. Rhoads. Headquarters: 1734 F Street, N.W..

**Washington, D.C.** An Institute on Puerto Rican problems was held in 1940. The 1941 annual convention will be held at Washington, D.C., May 2-4.

**Peace Conference, National**, founded in 1933 with a three-fold purpose: (1) as a council board at which its members express their views on American foreign policy and formulate and clarify issues; (2) as a clearinghouse to receive, record, and publicize the views of its affiliated organizations; (3) as a publisher and program servicing agency to provide its member organizations and the public with objective, non-partisan information. Membership: 38 national organizations. President: Walter W. Van Kirk. Headquarters: 8 West 40 Street, New York City. The annual meeting was held May 7-8, 1940, at International House, New York.

**Pen Women, National League of American**, founded in 1897 to promote the creative cultural arts of the pen, pencil, and brush. Membership: 3000. President: Edna Knight Gasch. Headquarters: 409 Willard Hotel, Washington, D.C. A biennial convention was held in Washington, D.C., in April, 1940.

**People's Lobby, Inc., The**, founded in 1931 (formerly the People's Reconstruction League, founded in 1920) to work for legislative and administrative measures in the national capital, in the interest of all the people. Membership: 1875. President: Bishop Francis J. McConnell. Executive Secretary: Benjamin Marsh. Headquarters: 1410 H Street, N.W., Washington, D.C. During 1940 the organization distributed about half a million reprints of its material from the *Congressional Record*. It was active in getting the Selective Service Bill amended to exclude certain features, and sought to popularize profitless defense and a pay-as-you-go policy for national defense. The 1941 annual meeting was scheduled at the Town Hall Club, New York City, Jan. 13.

**Petroleum Institute, American**, founded in 1919 to afford a means of co-operation with the government, foster trade in petroleum products, promote the interests of the industry, the mutual improvement of its members, and the study of related arts and sciences. Membership about 4000. President: Axtell J. Byles. Secretary: Lacey Walker. Headquarters: 50 West 50 Street, New York City. Meetings in 1941 include the 11th Mid-Year Meeting, in Tulsa, Okla., May 19-23, and the 22nd Annual Meeting in San Francisco, November 3-7.

**Philatelic Society, American**, an organization of stamp collectors, founded in 1886 for mutual benefit. Membership: 5016. President: Rollin E. Flower. Secretary: Dr. H. A. Davis. Headquarters: 3421 Colfax "A," Denver, Colo. The annual meeting, held in late summer, is scheduled for Baltimore, Md. in 1941.

**Philological Association, American**, founded in 1869 for the advancement and diffusion of philological knowledge. Membership: 1068. President: G. M. Calhoun. Secretary: L. R. Shero. Swarthmore College, Swarthmore, Pa. In 1940 the Association appropriated \$1000 to the British Classical Association in appreciation of the continued publication under war conditions of the *Classical Quarterly* and the *Classical Review*. The 1941 meeting will be held in Hartford, Conn., December 29-31. See *PHILOLOGY*, CLASSICAL.

**Physical Society, American**, founded in 1899 for the advancement and diffusion of knowledge of physics. Membership: 3800. President: Dean George B. Pegram. Secretary: Dr. K. K. Darrow. Headquarters: Columbia University, New York City. The annual meeting will convene, Dec. 26, 1941.

**Physicians, American College of**, founded in 1915 as an organization of qualified specialists to maintain and advance the highest possible standards, perpetuate the history and best traditions of medicine and medical ethics, and to maintain the dignity and efficiency of Internal Medicine in its relationship to public welfare. Membership: 3 masters, 3200 fellows, and 1217 associates; total, 4420. President: Dr. Roger I. Lee. Executive Secretary: E. R. Loveland. Headquarters: 4200 Pine Street, Philadelphia, Pa. The 25th anniversary of the founding of the College was marked in 1940 by the publication of a book, *The American College of Physicians—Its First Quarter Century*. A program was developed for determining and supervising standards for residencies in Internal Medicine and allied specialties. In addition to numerous State or sectional meetings, intensive postgraduate courses were conducted in various centers. The John Phillips Memorial Award for achievement in Internal Medicine was awarded to Dr. René J. Dubos of New York City. The 25th annual session will be held in Boston, Mass., Apr. 21-25, 1941.

**Planning and Civic Association, American**, formed in 1935 by a merger of the American Civic Association (1904) and the National Conference on City Planning (1909). It promotes public understanding and support of planning for the best use of land, water, and other natural resources, higher ideals of civic life, and safeguarding of natural wonders, scenic possessions, and recreation facilities. President: Horace M. Albright. Executive Secretary: Harlan James. Headquarters: 901 Union Trust Building, Washington, D.C. During 1940 the Association published the *American Planning and Civic Annual*, the quarterly *Planning and Civic Comment*, and held several conferences

on Federal and city parks. Meetings in 1941 include the Annual Dinner, Washington, D.C., January 29, and the Joint Planning Conference, Philadelphia, May 12-14.

**Poetry Week Fellowship of National Poetry Center**, an organization of poets and friends of poetry, founded in 1927 to advance the art, especially through the international celebration of Poetry Week, held annually the fourth week in May. Founder-Director: Anita Brown. Headquarters: 30 Rockefeller Plaza, New York City. In addition to the celebration of Poetry Week in 1940, the National Poetry Center conducted a National Poetry Day at the New York World's Fair, in connection with which gold medals were awarded in every State throughout the Nation. The largest book of poetry in the world, published by the Poets Press of the National Poetry Center was exhibited. Junior and Senior Poetry Prizes were awarded at the winter meeting at the Vassar Club, and certificates were presented to poets of merit at different meetings. Other awards include Gold Emblems of Honor presented to the foremost man and woman poet in New York State, Annual Poetry Scholarship Awards, and Poetry Parchments of Honor. The Center also conducts Poetry radio programs.

**Polish National Alliance of the U.S. of N.A.**, a fraternal society founded in 1880 for benefit insurance and educational and charitable activities. Membership: 300,000. President: I. K. Rozmarek. General Secretary: A. S. Szczerbowski. Headquarters: 1514-20 W. Division Street, Chicago, Ill. During 1940 the 60th Anniversary was celebrated at Palmer House. A convention is held once every four years, and the subsidiary lodges, which number about 2000, meet monthly.

**Political and Social Science, The American Academy of**, founded in 1899 to provide a forum for the discussion of the great political, social, and industrial problems confronting the world. Membership: 8000 to 9000. President: Dr. Ernest Minor Patterson. Secretary: Dr. J. P. Lichtenberger. Headquarters: 3457 Walnut Street, Philadelphia. A bi-monthly, *The Annals*, is published. The 1941 annual meeting was scheduled for Philadelphia in April.

**Political Science, Academy of**, an international learned society for advancing the political sciences and their application to political, economic, and social problems; founded in 1880. Membership: 6911. President: Wesley C. Mitchell. Director: Miss Ethel Warner. Headquarters: Fayerweather Hall, Columbia University, New York City. At the semi-annual meeting on Apr. 11, 1940, in New York City "Economic Nationalism, Trade Barriers and the War" was discussed. At the sixtieth annual meeting on November 13th the topic under discussion was "The Defense of the United States."

**Political Science Association, American**, founded in 1903 to foster scholarly interest in the scientific study and improvement of politics and public law, administration, and diplomacy. Membership: 2857. President: Frederic A. Ogg. Secretary: Kenneth Colegrove. Headquarters: 105 Harris Hall, Northwestern University, Evanston, Ill. The Association maintains a Personnel Service indicating the records of young scholars available for appointment. The 1941 annual meeting will be held in New York City, December 29-31.

**Postmasters of the United States, National Association of**, incorporated in 1936 for the betterment of the Postal Service and mutual assistance of all Postmasters. Membership: 28,054. President: Michael J. O'Rourke. Secretary: John J. Hart. Headquarters: Ottawa, Ill. During 1940 a Chapter of the Association was organized in Alaska. Eleven States had 100 per cent membership, including every postmaster in the State. The 1941 annual convention will be held in Boston, Mass., in September.

**Prevention of Blindness, National Society for the**, founded in 1915, concerned with the control and, where possible, the elimination of the causes of blindness, impaired vision, and eyestrain—not with activities on behalf of those already blind. Membership: 18,645. President: Mason H. Bigelow. Secretary: Miss Regina E. Schneider. Headquarters: 1790 Broadway, New York City. The Society co-operates with the medical profession, industry, nurses, medical social workers, and educational authorities in its efforts to conserve sight. It furnishes information regarding the relationship of sight to numerous environmental factors, stimulates study of the causes of blindness, counsels government and voluntary agencies, and serves as a clearinghouse in its field.

**Prevention of Cruelty to Animals, The American Society for the (ASPCA)**, founded in 1866. President: Alexander S. Webb. Secretary: Richard Welling. Headquarters: 50 Madison Avenue, New York, N.Y. During 1940, the Society handled 287,825 small animals in 5 animal shelters and a hospital, and investigated 11,799 cases of cruelty. The Humane Education Department gave instruction to 55,071 children and conducted a photographic contest for Junior High School Children. The annual meeting was held Jan. 2, 1941.

**Prevention of Lynching, Association of Southern Women for the**. See *LYNCING*.

**Prison Association, American**, founded in 1870 to improve laws, law enforcement, and penal and correctional institutions, to study the causes of crime, and to care for

and provide employment for paroled and discharged prisoners and probationers. The Association maintains a free clearinghouse of information. Membership: 890. President: James A. Johnston. General Secretary: E. R. Cass. Headquarters: 135 East 15 Street, New York, N.Y. The Annual Congress, which may be attended by anyone who wishes to profit thereby, will be held in San Francisco, Aug. 18-22, 1941.

**Progressive Education Association**, incorporated in 1931 to develop and promote progressive principles of education through field conferences, a Service Center for members, preparation and distribution of educational materials, and publication of two journals, *Progressive Education* and *Frontiers of Democracy*. Membership: about 10,000. President: Carleton Washburne. Executive Secretary: Frederick L. Redefer. Headquarters: 221 West 57 Street, New York City. In 1940 the eight-year experiment of the Association's Commission on the Relation of School and College was completed. Publications of the year were *Democratic Education* (suggestions for education and national defense) and a series of books on the reorganization of the secondary school curriculum. In addition to numerous regional conferences, a national conference is scheduled Feb. 19-22, 1941, in Philadelphia. See **EDUCATION**.

**Protection of Foreign Born, American Committee for**, founded in 1933 to promote better relations between native and foreign born by education; to combat discrimination on the ground of race, nationality, or non-citizenship, to encourage and facilitate naturalization; and to prevent the destruction of American families by deportation. It is not a membership organization, but has 400 annual contributors. Chairman: Carey McWilliams. Headquarters: 79 Fifth Avenue, New York City. The Fourth National Conference, held in Washington, D.C., in March, 1940, was attended by representatives of organizations having 5,000,000 members. The Conference was greeted by President Roosevelt, Secretary Hull, and other members of the Cabinet. The 1941 Conference will be held at Atlantic City, N.J., March 29-30.

**Psychiatric Association, American**, founded in 1844 to further the study of mental diseases; to further psychiatric hospitals, education, and research, and to apply psychiatric knowledge to other branches of medicine, to other associations, and public welfare. Membership: 2423. President: Dr. George H. Stevenson. Executive Assistant: Austin M. Davies. Headquarters: 9 Rockefeller Plaza, New York City. Activities in 1940 included the compilation of military information and data and the preparation of a biographical directory of members of the Association. The 1941 meeting was scheduled for Richmond, Va., May 5-9.

**Psychological Association, American**, founded in 1892 to advance psychology as a science. Membership: 2739. President: Herbert Woodrow. Secretary: Willard C. Olson. Headquarters: University of Michigan, Ann Arbor, Mich. The 1941 meeting is scheduled September 3-6 at Northwestern University.

**Psychology, American Association for Applied**, listed under **Applied**.

**Public Affairs, Institute of**, founded in 1927 to explore by formal addresses and open forum discussions important public problems. Membership: 3000 yearly, 32,000 total. Director: Hardy Cross Dillard. Secretary: Anne Cowle Yates. Headquarters: University of Virginia, Charlottesville, Va. Students from colleges in all sections of the East participated in the 1940 sessions. The 1941 sessions will be held at the University of Virginia at the end of June.

**Public Health Association, American**, founded in 1872 to promote and protect the public health. Membership: 7100. President: Dr. W. S. Leathers. Executive Secretary: Dr. Reginald M. Atwater. Headquarters: 1790 Broadway, New York City. The Association prepared during 1940 a study on community organization for health education, and published reports on Control of Communicable Diseases. Fellowship privileges were extended to professional public health workers in Latin America. The A.P.H.A. adopted an Official Declaration of Attitude on Desirable Standard Minimum Functions and Suitable Organization of Health Activities. A Committee on Public Health in National Defense was appointed. The Sedgwick Memorial Medal was awarded in 1940 to Dr. Hans Zinsser. In a City Health Contest, financed by a group of life insurance companies, the winners were (by groups according to population): Milwaukee, Wis.; Memphis, Tenn.; New Haven and Hartford, Conn.; Newton, Mass.; Greenwich, Conn., and Plainfield, N.J.; Englewood, N.J. A Rural Health Contest was conducted also, financed by the Kellogg Foundation. The 70th annual meeting will be held at Atlantic City, N.J., Oct. 14-17, 1941.

**Public Housing Conference, National**, an association of individuals and organizations, founded in 1931 to promote slum clearance and low-rent housing through an established Federal-State-Local service. Membership: 1000. President: Mary K. Simkhovitch. Executive Director: Helen Alfred. Headquarters: 122 East 22 Street, New York City. The 1940 program included meetings, publications, housing tours, and the use of visual material and the radio to support a campaign against slums. The 1941

annual meeting was scheduled in New York City, January 24-25.

**Public Welfare Association, American**, founded in 1930 to serve as a clearinghouse on public welfare information, and to provide technical and consultant services to public welfare administrators. Membership: about 2500. President: William Hodson. Director: Fred K. Hoehler. Headquarters: 1313 East 60 Street, Chicago, Ill. A National Council of State Public Assistance and Welfare Administrators and a National Council of Local Welfare Administrators were organized in 1940. Meetings of the two National Councils were held in Chicago in May and at the Fifth Annual Round Table Conference of the American Public Welfare Association, December 4-8, in Washington, D.C. See **JUVENILE DELINQUENCY**.

**Radio, National Committee on Education by**, listed under **Education**.

**Radio Manufacturers Association**. See **FEDERAL COMMUNICATIONS COMMISSION**.

**Railroads, Association of American**, founded in 1934 to promote trade and commerce in the public interest, further improve railroad service, and maintain the integrity and credit of the railroad industry where concert of policy and action are required. Membership: 138 railroad systems and 180 associate members. President: J. J. Pelley. Secretary-Treasurer: H. J. Forster. Headquarters: Transportation Building, Washington, D.C. See **RAILWAYS**.

**Recreation Association, National**, founded in 1906 with the following objective: That every child in America shall have a chance to play, that everybody in America, young or old, shall have an opportunity to find the best and most satisfying use of leisure time. Membership: 8836. First Vice-President: John G. Winant. (The Presidency is vacant.) Secretary: Howard Braucher. Headquarters: 315 Fourth Avenue, New York City. In the defense emergency which arose during 1940, the Association was particularly active in attempting through recreation to maintain the morale of the people and to give such service as it can to help communities near defense camps provide adequate leisure-time programs for men on leave. The 25th National Recreation Congress was held at Cleveland, Ohio, Sept. 30-Oct. 4, 1940.

**Red Cross, American National**. See separate article.

**Research Council, National**, founded in 1916 to "promote research in the mathematical, physical, and biological sciences, and in the application of these sciences to engineering, agriculture, medicine, and other useful arts, with the object of increasing knowledge, of strengthening the national defense, and of contributing in other ways to the public welfare." Membership: about 200, composed in majority of representatives of 85 scientific and technical societies; together with about 1150 members of committees of the Council and its Divisions. Chairman: Ross G. Harrison. Executive Secretary: Albert L. Barrows. Headquarters: 2101 Constitution Avenue, Washington, D.C. The Council conducts a wide range of research activities in the medical and natural sciences under the sponsorship or supervision of specially appointed committees. Series of post-doctorate fellowships are administered in the medical and in the natural sciences. A number of publications resulting from work of the Council's Committees are issued each year, either commercially or in the *Bulletin* or *Reprint and Circular Series* of the Council. As an operating agency of the National Academy of Sciences, the Council has been called upon frequently during the past year by agencies of the Government for advice and assistance in connection with research relating to the national defense.

**Research Council of Canada, National**, founded in 1916 to have charge of all matters affecting scientific and industrial research in Canada which may be assigned to it by the Committee of the Privy Council on Scientific and Industrial Research. Membership: 15. President: Lt.-Gen. A. G. L. McNaughton (recalled to active duty). Acting President: C. J. Mackenzie. Secretary: S. P. Eagleson. Headquarters: National Research Building, Ottawa, Can. The peacetime program of the Council was modified in 1939-40 to meet the needs for scientific and industrial research relating to war projects. Construction of new aeronautical laboratories was begun. Supplementing its laboratory establishment at Ottawa, the Council granted 69 scholarships for postgraduate research and provided 116 grants-in-aid to responsible research workers in universities for special investigations. Special provision was made for research on war projects at various centers.

**Retail Dry Goods Association, National**, a trade association founded in 1911 for research work in common management and operating problems of department and specialty stores and representation in national legislative matters in industry relations. Membership: 5700. President: Frank Mayfield. General Manager: Lew Hahn. Headquarters: 101 West 31 Street, New York City. The week of Sept. 16, 1940, was set aside for National Retail Demonstration. During the year the association conducted a co-operative program with the Government to prevent unjustified price increases in consumer goods, and inaugurated 20 conferences with industries to effect practical means of compliance with the Wool Labeling Law. The Wolf Retail Award for the most effective package created in the department store field in 1939 was awarded to

Gimbel Brothers, New York. A medal was awarded in 1940 to Maj. Benjamin H. Namm, President of the Namm Store, Brooklyn, N.Y., for outstanding service for the retail trade over a period of years. Mrs. Typical Customer for 1940 was Mrs. Roy Fleming of Hot Springs, Ark. Meetings scheduled for 1941 are the Annual Convention, New York City, Jan. 13-17 and the Mid-Year Convention, Chicago, June 2-5.

**Review of Motion Pictures, Inc., National Board of.** An organization founded in 1909 to encourage the best uses of the motion picture recreationally, educationally, and artistically. Membership: 500. The President is Dr. A. A. Brill; Executive Director, James Shelley Hamilton. Headquarters: 70 Fifth Avenue, New York City. The 15th annual announcement of the Board's choices of the best films of the year was made on Dec. 23, 1940, as follows: Best film of the year, *The Grapes of Wrath*, best foreign-language film, *The Baker's Wife*; best documentary film, *The Fight for Life*, with Honorable Mention given to *Power and the Land*. The ten best American films selected, in order of preference, were: *The Grapes of Wrath*, *The Great Dictator*, *Of Mice and Men*, *Our Town*, *Fantasia*, *The Long Voyage Home*, *Foreign Correspondent*, *The Biscuit Eater*, *Gone with the Wind*, and *Rebecca*.

**Rotary International**, a worldwide organization which serves as a clearinghouse for all Rotary Clubs, the first of which was formed in 1905. A Rotary Club is a group of representative men (one from each business or profession in a community) who gather together to further the ideal of service in community and business contacts. Membership: 5042 clubs; 209,940 members. President: Armando de Arruda Pereira of Brazil. Secretary: Chesley R. Perry. Headquarters: Chicago, Ill., with additional offices in Zurich, London, and Bombay. Rotary Observance Week, Feb. 18-24, 1940, was a worldwide celebration of Rotary's 35th anniversary. More than 300 "Institutes of Understanding" were sponsored by Rotary clubs in the U.S.A., presenting outstanding speakers on vital world problems in community forums and in high schools. Rotary International contributed \$50,000 for war relief in 1940 through the International Red Cross, the American Red Cross, the Canadian Red Cross, the British Red Cross, and the Chinese Red Cross. Rotary clubs throughout the world contributed to a special Rotary International fund which provides assistance to Rotarians and their families in the war-torn countries of the world. Rotary International assisted in the evacuation of many children from Europe, placing them in the homes of North American Rotarians. The 31st annual convention of Rotary International was held in Havana, Cuba, June 9-14, and was attended by nearly 4000 Rotarians and their families from 32 countries of the world.

**Royal Geographical Society**, listed under *Geographical*. **Royal Institution of Great Britain**, founded in 1799 for the promotion, diffusion, and extension of science and useful knowledge. Membership about 900 President: The Right Hon. Lord Eustace Percy. Secretary: Maj. Charles E. S. Phillips. Headquarters: 21 Albemarle Street, London, W. 1.

**Royal Society**, founded in 1662 for improving natural knowledge. Membership: 450 and an additional 50 foreign members. President: Sir Henry Dale. Secretaries: Prof. A. V. Hill and Prof. A. C. G. Egerton. Headquarters: Burlington House, London, W. 1. Awards were made during 1940 as follows. Copley Medal to P. Langevin; Rumford Medal to K. N. G. Siegbahn; Royal Medals to P. M. S. Blackett and F. H. A. Marshall; Davy Medal to H. C. Urey; Darwin Medal to J. P. Hill; Sylvester Medal to G. H. Hardy, and Hughes Medal to A. H. Compton. The Bakerian Lecture was delivered by Prof. N. V. Sidgwick on June 24, 1940. Plans for 1941 were unsettled owing to the war, except for an Anniversary Meeting scheduled December 1. See *CHEMISTRY, INDUSTRIAL*.

**Safety Council, National**, founded in 1913 to bring about public understanding of the steps necessary to prevent accidents of all kinds. Membership: 5216. President: Col. John Stilwell. Managing Director: W. H. Cameron. Headquarters: 20 N. Wacker Drive, Chicago, Ill. Reports were made during 1940 by six special accident-study committees on Night Traffic Hazards, Speed Regulation, Pedestrian Control and Protection, Tests for Intoxication, Winter Driving Hazards, and National Traffic-Law Enforcement. The year's accident-prevention activities culminated in the 29th National Safety Congress and Exposition in Chicago, October 7-11. The Association's service was expanded through standard magazines, Safe and Health Practices Pamphlets, Safety Posters, and thousands of miscellaneous publications. Hundreds of awards were made in all kinds of safety contests—traffic, industrial, and otherwise. See *ACCIDENTS*.

**Savings and Loan League, United States**, a trade organization founded in 1892 by the savings, building, and loan associations of the United States, whose assets total \$6,500,000,000 and whose chief business is the lending of money to finance home ownership. Membership 3700 associations and 47 affiliated state leagues. President: Paul Endicott. Secretary: H. F. Cellarius. Headquarters: 333 N. Michigan Avenue, Chicago, Ill. At the annual convention in Chicago, Nov. 11-15, 1940, the Associations pledged

their full support of the defense housing program. The League published the 10th of its series of year books, *Savings and Loan Annals 1939*. The year 1940 represented the first billion-dollar lending year for the Association since 1930.

**Scandinavian Foundation, American**, listed under *American*.

**Science, American and British Associations for the Advancement of**, listed under *Advancement*.

**Sculpture Society, National**, founded in 1893 to advance the knowledge, creation, and appreciation of good sculpture by annual exhibitions and all other means in the Society's power. Membership: 280. President: Paul Manship. Secretary: Mrs. Margaret French Cresson. Headquarters: 115 East 40 Street, New York City. The Medal of Honor was awarded in 1940 to Herbert Adams in recognition of his distinguished sculpture and devoted services to the profession. First prize for design of the Medal of Honor was won through competition by Henry Kreis. In the spring a Sculpture Festival Exhibition was held at the Whitney Museum of Art, New York.

**Securities Dealers, National Association of**. See *FINANCIAL REVIEW under Financial Regulation*.

**Seeing Eye, The**, a philanthropic organization founded in 1929 for the purpose of furnishing dogs as guides to blind persons. Membership: 15,367. President: Henry A. Colgate. Treasurer: Herman J. Cook. Mrs. Harrison Eustis, founder, is the Honorary President. The organization maintains a school at Morristown, N.J., where dogs are trained, separately for three months and with their blind masters for a period of one month. During the fiscal year ending Sept. 30, 1940, 144 blind men and women were graduated with their educated dogs, 304 applicants were investigated, and 116 were accepted for classes during the succeeding year. Approximately 570 persons now use Seeing Eye dogs. The maximum cost to the blind person is \$150 although the actual cost of training the dog is many times that amount.

**Shipbuilders, National Council of American**, founded in 1921 by shipbuilders, ship-repairers, and manufacturers of marine equipment in a united effort to promote a sound shipbuilding industry as the basis of the American merchant marine and as an auxiliary to the navy yards, and to improve conditions in the industry. Membership 51. President: H. Gerrish Smith. Secretary: C. C. Knerr. Headquarters: 21 West Street, New York City. The annual meeting will be held in April, 1941, at the Whitehall Club, New York City.

**Silver Legion of America**. See *DIPS COMMITTEE*.

**Social Hygiene Association, American**, formed in 1914 to inform the public about the national program and needed community action, to combat syphilis and gonorrhea, to fight prostitution and other unwholesome conditions, to promote sound sex education and training for marriage and parenthood, and to protect and improve the American family as the basic social institution. Membership 147 organizations, approximately 10,000 individuals. President: Dr. Ray Lyman Wilbur. Executive Director: Dr. Walter Clarke. Headquarters: 1790 Broadway, New York City. The Association undertakes to promote an eight-point program in 48 States, working in co-operation with other interested agencies. Services include advice and consultation, surveys, distribution of literature, films, and other materials. During 1940 the Fourth National Social Hygiene Day was sponsored with more than 5000 meetings throughout the country. A digest of laws relating to the control of syphilis and gonorrhea was published, and a new sound film, *With These Weapons*, was distributed. The William Freeman Snow medal for distinguished service in the social hygiene field was presented to Gen. John J. Pershing, and 11 cash awards were made to the Junior Chambers of Commerce conducting the most successful anti-syphilis projects. Regional conferences were scheduled in Philadelphia, New Orleans, Los Angeles, St. Louis, and New York on Feb. 5, 1941.

**Social Science, Henry George School of**, listed under *Henry George*.

**Social Sciences, National Institute of**, incorporated in 1899 to reward distinguished services rendered to humanity, either by election to membership, or by bestowal of its Honor Medals, or other insignia. Membership 590. President: William Edwin Hall. Secretary: Miss Rosina Hahn. Headquarters: 271 Madison Avenue, New York City. At the annual dinner, May 7, 1940, in New York City, gold medals were awarded to Wendell L. Willkie, Mrs. Carrie Chapman Catt, and Dr. James E. West, Chief of the Boy Scouts. The 1941 annual meeting was scheduled in New York City, February 4.

**Social Work, National Conference of**, founded in 1873 to facilitate discussion of the problems and methods of practical human improvement, to increase the efficiency of organizations devoted to this cause, and to disseminate information. It does not formulate platforms. Membership: 6000. President: Jane M. Hoey. General Secretary: Howard R. Knight. Headquarters: 82 N. High Street, Columbus, Ohio. The 1941 meeting will be held in Atlantic City.

**Social Workers, American Association of**, founded in 1921 to formulate and establish standards of personnel and of conditions under which social work is practiced, to dis-

seminate information concerning the profession, and to conduct investigations which contribute to an understanding of social welfare needs. Membership: 11,250. President: Wayne McMillen. Executive Secretary: Walter West. Headquarters: 130 East 22 Street, New York City. A survey of relief conditions in the United States was published in May, 1940. The 1941 Delegate Conference will be held in Atlantic City in May.

**Sociological Society, The American**, founded in 1905 to encourage sociological research, discussion, teaching, and publication. Membership: 1031. President: Robert M. MacIver. Secretary: Harold A. Phelps. Headquarters: University of Pittsburgh, Pittsburgh, Pa. During 1940 the Society completed a study of members and instituted a study of the role of sociology in the national emergency. A leaflet on *Occupations of Sociologists* was published. The 1941 meeting will be held in Washington, D.C., December 29-31.

**Standards Association, American**, a federation of national groups dealing with standardization, founded in 1918. Membership: 72 trade associations, technical societies, and government departments, and some 2000 industrial concerns, who hold membership either directly or by group arrangement. President: R. E. Zimmerman. Secretary: P. G. Agnew. Headquarters: 29 West 39 Street, New York City. The National Defense Program, with its need for co-ordination of defense-production standards, highlighted almost all standardization work in the mechanical field in 1940, and at the end of the year the Association was speeding up work on undertakings most urgently needed for defense—for example, work on screw threads, on bolts, nuts, and wrench openings, on machine pins; on wire and sheet metal gages; on fits of machine parts; and on some of the safety codes which are needed to protect the inexperienced labor that is being turned into defense production. During the year 73 standards were approved, including one on Twist Drills and the American Standard Rules for Rounding Off Numerical Values, which sets forth a simple and effective method of rounding numbers, pointing out a common error in the practice followed by most schools. A committee representing groups interested in photographic supplies and equipment completed the first standard in this field—a proposed Method for Determining the Photographic Speed of Roll Film, Film Packs, and Miniature Camera Films, which was being published for a year's trial. The National Electrical Code was completely revised, and a new edition of the American Standard Building Exits Code provided technical data on exit facilities in public buildings. Progress was made on the standardization of sizes for children's clothing—a project in which there is wide public interest. The committee in charge completed a series of average body dimensions for boys in the age range from kindergarten to junior high school. Four new projects in the field of safety were authorized during the year. Safety Code for Quarry Operations, Performance Requirements for Protective Occupational Footwear; Safety Standards for Household Ladders; Safety Standards for General Industrial Stairs. Despite the war in Europe, the American Standards Association kept up its contacts with the national standardizing bodies of other countries, and was able to supply American companies filling foreign orders with information and material that they could obtain nowhere else. The British Purchasing Commission continually called on the ASA for standards and specifications. See *PHOTOGRAPHY* under *Physical Measurements*.

**State Governments, The Council of**, founded in 1925 by the States to encourage co-operation among them, to make State government more effective, and to serve as a clearinghouse of information for public officials. It is also the secretariat of the Governors' Conference, the American Legislators' Association, the National Association of Attorneys General, the National Association of Secretaries of State, and the National Conference of Commissioners on Uniform State Laws. (The Council was appointed secretariat for the last-named Conference on Sept. 9, 1940, at its annual meeting with the American Bar Association.) Membership: 44 States. President: Gov. Harold E. Stassen. Executive Director: Frank Bane. Headquarters: 1313 East 60 Street, Chicago, Ill. The Council participated in the work of the Board of Inquiry into Great Lakes Fisheries, set up Feb. 29, 1940, and co-operated with the Division of State and Local Co-operation of the National Defense Advisory Commission after its formation. A Federal-State Conference on Law Enforcement Problems of National Defense was held in co-operation with the Department of Justice in Washington, August 5-6. The Fifth General Assembly was scheduled to meet in Washington, Jan. 21-24, 1941.

**Statistical Association, American**, founded in 1839 as a scientific and educational organization of persons seriously interested in the application of statistical methods to practical problems, the development of more useful methods, and the improvement of basic statistical data. Membership: 2750. President: Prof. Winfield W. Riefler. Secretary: R. L. Funkhouser. Headquarters: 1626 K Street, N.W., Washington, D.C.

**Student Federation of America, National**, founded in 1925 to achieve a spirit of co-operation among U.S. stu-

dents, to develop and vigorously express an intelligent student opinion on questions of national and international importance, to further an enduring peace, and to create and endeavor to execute a program for the youth of America on vital problems. The Federation acts independently of any political party or religious sect. Membership: student councils of about 125 colleges and universities. President: John Darnell. Headquarters: 1410 H Street, N.W., Washington, D.C. The 17th annual congress will be held Dec. 27-31, 1941.

**Student Service, International**, founded in 1920 to provide the student with opportunity for action without losing sight of his responsibility for objective and thorough study. It is not a membership organization. Chairman of the Executive Committee: Alvin Johnson. General Secretary: Joseph P. Lash. Headquarters: 8 West 40 Street, New York City. In addition to its traditional work of aiding student refugees, the I.S.S. was expanded in 1940 to include conferences on problems of democracy, voluntary work camps, and publication activities. Meetings scheduled for 1941 included a conference on "War Aims" at Smith College, March 4, a conference on "The Student and National Defense" at Yale in April, and annual conferences in September and December.

**Student Union, American**, founded in 1935 to defend democratic education, keep America out of war, and preserve American democratic traditions. Membership: 20,000. President: Richard Bancroft. Executive Secretary: Herbert Witt. Headquarters: 381 Fourth Avenue, New York City. Events of 1940 included a Peace Strike in April, a Summer Institute, a Fall Planning Conference, and the Sixth National Convention. The Seventh National Convention will be held Christmas week, 1941.

**Sunday-School Union, American**, founded in 1824 to establish and maintain Sunday schools and to publish and circulate moral and religious publications. Thirty-six laymen constitute the Board of Managers. President: Dr. E. Clarence Miller. Secretary: John H. Talley. Headquarters: 1816 Chestnut Street, Philadelphia, Pa. The Daily Vacation Bible School work was successfully continued in 1940, and growth was reported in young people's Bible conferences.

**Surgeons, American College of**, founded by the surgeons of the United States and Canada in 1913 to advance the science and the ethical and competent practice of surgery, to establish hospital standards, to engage in research, to aid in better instruction of doctors, to formulate standards of medicine and to improve all adverse conditions surrounding the ill and injured wherever found. President: Everts A. Graham. Secretary: Frederic A. Besley. Headquarters: 40 East Erie Street, Chicago, Ill. Three sectional meetings were held in 1940 in addition to the annual meeting and clinical congress at Chicago, October 21-25. Work was carried on by the following departments: Hospital Standardization, Clinical Research, Library and Department of Literary Research, Medical Motion Pictures, and Graduate Training for Surgery. The award for Prize Winning Case Histories was granted to Dr. Martin Batts, Jr., of Ann Arbor.

**Swedish Historical Foundation, American**, established in 1926 to promote good citizenship and patriotic purposes among citizens of Swedish origin. Membership: 5000. President: Dr. Julius Lincoln. Corresponding Secretary: Dr. Amandus Johnson. Headquarters: American Swedish Historical Museum, Philadelphia, Pa. Lecturers in 1940 included Willem van Loon, Pearl Buck, and Luise Olsen. The Lucia Festival was presented, depicting Christmas life in Sweden. The 1941 meeting will be held in Philadelphia in June.

**Temperance Groups**. See under *Alcoholism*, *Anti-Saloon League*, *Woman's Christian Temperance Union*.

**Testing Materials, American Society for**, a technical society founded in 1898 to promote knowledge of the materials of engineering and to standardize specifications and the methods of testing. Membership: 4400. President: W. M. Barr. Secretary-Treasurer: C. L. Warwick. Headquarters: 260 S. Broad Street, Philadelphia, Pa. During 1940 the 14th award of the Charles B. Dudley Medal and the first Sanford E. Thompson Award were made to T. F. Willis and M. E. De Reus for their paper on "Thermal Volume Change and Elasticity of Aggregates and Their Effect on Concrete." In 1941 the Spring Meeting and Committee Week will be held at Washington, D.C., March 3-7, and the Annual Meeting and Sixth Exhibit at Chicago, June 23-27.

**Trucking Associations, Inc., American**, a national association for the motor freight industry, organized in 1933. Membership: 51 associations. President: Ted V. Rodgers. General Manager: J. V. Lawrence. Headquarters: 1013-16th Street, N.W., Washington, D.C. During 1940 a national advertising campaign was launched in national weekly magazines. Numerous prizes and awards were granted for fleet safety work and driver skill.

**Tuberculosis Association, National**, founded in 1904 for the study and prevention of tuberculosis. Membership: over 1600. President: Dr. P. P. McCain. Secretary: Dr. Charles J. Hatfield. Headquarters: 1790 Broadway, New York City. In 1940 the Trudeau Medal was awarded to

Dr. William Charles White. The 1941 annual meeting was scheduled to be held in San Antonio, May 5-8.

**University Professors, American Association of**, a professional organization of college and university teachers and investigators, founded in 1915 to facilitate more effective co-operation among its members, to promote the interests of higher education and research, and to increase the usefulness and advance the standards and ideals of the profession. The nature of its work is indicated by the titles of the committees, which include Academic Freedom and Tenure, Freedom of Speech, International Relations, Educational Standards, Author-Publisher Contracts, Professional Ethics, Relation of Junior Colleges to Higher Education, Co-operation with Latin-American Universities, Pensions and Insurance, Preparation and Qualification of Teachers, Encouragement of University Research, Library Service, and the Economic Welfare of the Profession. Membership: about 16,000. President: Frederick S. Denbler. General Secretary: Ralph E. Himstead. Headquarters: 744 Jackson Place, N.W., Washington, D.C. An annual meeting is held, usually in the last week of December.

**University Women, American Association of**, founded in 1882 for practical work in education, especially the raising of standards in higher education for women. Membership: over 68,000. President: Margaret S. Morris. General Director: Kathryn McHale. Headquarters: 1634 I Street, N.W., Washington, D.C. The number of local branches increased by 28 to a total of 891 on June 1, 1940. During the year the Association developed a program for local branches, relating their efforts to defense needs, and launched a movement for registration of members to secure information useful in connection with national defense. A nation-wide program of study and community activities was carried on by local groups, particularly on schools, the child and the family, international relations, the consumer, social welfare, other social and economic topics, and the arts. Eighteen new study guides were published in these fields in addition to the 40 previously issued. Approximately \$48,000 was added to the fellowship endowment fund, which now totals over \$574,500, and 13 research fellowships were awarded. Homes were offered for 4000 refugee children, and \$17,907 was contributed to aid women war refugees. A Code of Ethics for Volunteers was issued. The National Biennial Convention will be held in Cincinnati, Ohio, May 5-10, 1941.

**Veterans of Foreign Wars of the United States**, founded in 1899 to perpetuate the comradeship formed among men who have borne arms in America's wars and campaigns on foreign soil or in hostile waters, and to continue their patriotic service in behalf of the nation as a whole, of children, and particularly of disabled veterans and the widows and orphans of veterans. Membership: about 250,000. Commander-in-Chief: Dr. Joseph C. Menendez. Headquarters: Broadway at 34th Street, Kansas City, Mo. During 1940 the V.F.W. promoted the display of approximately 12,000 24-sheet billboard posters on signboards in every State proclaiming "Foreign 'isms' can't divide Americans—United we stand!—One Nation indivisible with liberty and justice for all," as a part of the V.F.W.'s nationwide educational campaign on Americanism. *Fifth Column Facts*, a detailed exposé of Communist, Nazi, and Fascist methods and organizations in the United States, was printed and more than 200,000 copies were placed within the first few weeks through the offices of more than 3500 local V.F.W. posts and 2000 V.F.W. Auxiliary units. Also included in the V.F.W. educational campaign were more than 600 full-page Memorial Day and Armistice Day newspaper editorials calling for a re-dedication of the spirit of Americanism and adherence to our national ideals and principles. V.F.W. legislative achievements in 1940 included enactment of the Philippine Travel Pay Bill providing for the payment of travel pay and allowances to a group of Philippine Insurrection veterans for services rendered in 1900-02. Another increased the pensions of approximately 30,000 World War widows whose veteran husbands died of service-connected disabilities, from approximately \$30 to approximately \$40 a month each. Another liberalization of veterans laws, obtained with the support of the V.F.W., was embodied in a Veterans' Administration ruling providing that total disability ratings may henceforth be applied to many cases not previously allowable.

Gold V.F.W. Citizenship Medals were awarded in 1940 to J. Edgar Hoover, Director of the Federal Bureau of Investigation, for his leadership in the exposure of Fifth Column sabotage of American ideals and institutions, and to Harry M. Warner, president of Warner Brothers Pictures. Robert Stotler, the year's outstanding Boy Scout, received the annual scholarship award and gold medal. About 100,000 students participated in the fifth annual national high school essay contest. The 41st annual national encampment was held, Aug. 25-30, 1940, at Los Angeles, Calif.

**Veterinary Medical Association, American**, founded in 1863 to promote veterinary science and its proper application. Membership: 6200. President: H. W. Jakeman. Secretary: L. A. Merrill. Headquarters: 600 South Michigan Ave., Chicago, Ill. The International Veterinary Congress prize for outstanding research was awarded in 1940 to Dr.

I. Forest Huddleson of Michigan State College. The 1940 meeting, held in Washington, D.C., was the largest in the association's history. The 1941 meeting is scheduled Aug. 11-15 at Indianapolis, Ind. See **VETERINARY MEDICINE**.

**Vocational Association, Inc., American**, founded in 1925 with the conviction that occupational education is a primary right and privilege of every citizen and that the public school must extend its services to include guidance, training for vocational competence, occupational placement, and the adjustment, training, and retraining of adults. Membership: 24,000. President: L. R. Humphreys. Executive Secretary: L. H. Dennis. Headquarters: 1010 Vermont Avenue, N.W., Washington, D.C. During 1940 the Association gave organized assistance to the effective development of vocational training for national defense industries. Over a quarter of a million persons were trained for occupations in defense industries in the last six months of the year and thousands were in training at the year's end. The annual convention will be held in Boston, Mass., in December, 1941.

**Vocational Guidance Association, Inc., National**, founded in 1913 to unite persons engaged or interested in any phase of vocational guidance. Membership: 3100. President: Mary P. Corcoran. Executive Secretary: Ralph B. Kenney. Headquarters: 425 West 123 Street, New York City. In November, 1940, a Conference on Defense and Vocational Guidance was held jointly with the Occupational Information and Guidance Service of the U.S. Office of Education in Washington. The 1941 national convention was scheduled at Atlantic City, February 19-22.

**Weights and Measures, American Institute of**, founded in 1916 to defend the English system of weights and measures against pro-metric propaganda. Membership: 85 corporations. President: W. R. Ingalls. Secretary: Robert F. Cogswell. Headquarters: 33 Rector Street, New York, N.Y.

**Wildlife Institute, American**, an educational and scientific organization for the restoration of North American wildlife, founded in 1935. President: Frederic C. Walcott. Secretary: J. Paul Miller. Headquarters: 822 Investment Building, Washington, D.C. The Institute maintains ten co-operative game management and wildlife research units in different States. Activities during 1940 included waterfowl investigations at Delta, Man., Canada, bass stream improvement in Indiana, initiation of a study of the Atlantic salmon on the Denny's River, Maine, and publication of the results of study on fish predators. The Sixth North American Wildlife Conference was scheduled Feb. 17-19, 1941, at Memphis, Tenn.

**Woman's Christian Temperance Union, National**, founded in 1874 to unite the Christian women of the United States for the education of public sentiment to total abstinence from the use of all alcoholic liquors, and to train the young in habits of sobriety. Membership: about 500,000. President: Mrs. Ida B. Wise Smith. Secretary: Mrs. Anna Marden DeYo. Headquarters: 1730 Chicago Avenue, Evanston, Ill. An outstanding project of the year was the holding of 25 Regional Conferences, by which every State in the Union was covered. The object was "training for service." Each local union in the United States (of which there are almost 10,000) was asked to make a survey of the social welfare conditions existing in the community and fill out a questionnaire showing the results. The facts revealed were used to show the conditions brought about by the entrenchment of saloons in the economic, political, and social life of the community.

An annual convention will be held in Grand Rapids, Mich., Aug. 28 to Sept. 3, 1941.

**Women of the U.S., Inc., National Council of**, founded in 1888 as a confederation of workers committed to the overthrow of all forms of ignorance and injustice, and to the application of the Golden Rule to society, custom, and law. Membership: 17 affiliated organizations; 5,000,000 individuals. President: Mrs. Harold V. Milligan. Executive Secretary: Mrs. Charlotte Payne. Headquarters: 501 Madison Avenue, New York City. During 1940 the Council presented a series of radio broadcasts over the NBC Blue Network, entitled "Peggy Wood's Quilting Bee"; organized a Women's Emergency Council to consider the role of women in national defense and developed a program entitled "What Women Can Do to Preserve Democracy"; celebrated September 16 as National Council of Women Day at the New York World's Fair, with the theme "The Efficiency of Democracy"; participated in the Women's Centennial Congress, December 17-19; and presented radio book reviews over 70 stations (to continue through 1941). A list of the ten best books on the crisis in democracy was selected and made public. The Council was chosen as the sponsoring organization of the talks heard during intermission throughout the Metropolitan Opera Saturday afternoon broadcasts during the 1940-41 season. An illuminated parchment was presented to Princess Juliana of the Netherlands, pledging the devotion of the Council's efforts to the cause of democracy.

**Women Painters and Sculptors, National Association of**, founded in 1889 to exhibit and display works of art by contemporary artists. Membership: 800. President: Bianca Todd. Executive Secretary: Josephine Droege. Headquarters: the Argent Galleries, which the Association main-

tains, 42 West 57 Street, New York City. The Association sponsors an Annual Exhibition, at which a number of prizes are awarded, general exhibitions, rotary shows, a sketch class, lectures, etc. The annual open meeting is held at the headquarters the second Wednesday in April.

**Women's Clubs, General Federation of**, founded in 1890 to bring into communication with one another the various women's clubs throughout the world. President: Mrs. Saidie Orr Dunbar. Headquarters: 1734 N Street, N.W., Washington, D.C. The Golden Anniversary of the Federation was celebrated in 1940. Study programs of the year were devoted to an Imaginary Tour of Latin America, used by 2126 clubs. The Purposes of Education in American Democracy, and Spiritual Values in Family Life. An actual Good Neighbor Tour to South America was made by 22 club women in the summer. The Federation developed a tentative platform for consumer business relations and co-operated with other groups in a consumer information program. Other events included participation in the White House Conference on Children in a Democracy, observance of Citizenship Days, essay, art, and other contests, youth improvement programs, and public safety programs. A triennial convention will be held at Atlantic City, May 19-24, 1941.

**Women Voters, National League of**, established in 1920 to promote political education through active participation of citizens in government. Membership: 31 affiliated State Leagues and 556 local Leagues. President: Miss Marguerite M. Wells. Secretary: Mrs. Paul Eliel. Headquarters: 726 Jackson Place, Washington, D.C. A biennial convention was held in New York City in April, 1940. The 1941 meeting of the General Council will be held in Washington, D.C., May 6-8.

**World Alliance for International Friendship through the Churches**, founded in 1914 to promote international goodwill and peace. Membership: about 1000. President: Rt. Rev. G. Ashton Aldham. General Secretary: Henry A. Atkinson. Headquarters: 70 Fifth Avenue, New York City. The organization published in 1940 a monthly *News Letter*, four *News Letter Supplements*, *Building a Peace Committee in the Church*, and *Worship Services for Peace and Brotherhood*.

**World Peace Foundation**, established in 1910 to promote international order and peace through publications, study groups, and a reference service. It has no membership other than the 15 Trustees. President: George H. Blakeslee. Director: S. Shepard Jones. Headquarters: 40 Mt. Vernon Street, Boston, Mass. The Foundation inaugurated a new pamphlet series in 1940, *America Looks Ahead*, and published *Document on American Foreign Relations, Vol. II*. Various round table discussions were held on American foreign policy.

**Young Men's Christian Associations, The National Council of**, formed as a national committee in 1866. The first local organization was formed in London in 1844 (in the United States in 1851) for the physical, mental, social, moral, and religious education of youth. Membership: 1,316,573. President: Ralph W. Harbison. General Secretary: Eugene E. Barnett. Headquarters: 347 Madison Avenue, New York City. Significant events of 1940 included the Annual National Council legislative meeting; the third National Hi-Y Congress of 1000 delegates from high school YMCA clubs, the National Young Men's Assembly presenting local young men's councils conferring nationally about jobs, war, government, education, marriage, and spare time, the 23d Silver Bay Industrial Conference on industrial relations followed by 15 field conferences; a special project in Citizenship and Public Affairs education among young people, adaptation of the normal service in military establishments to enlarged military and defense units and especially Selected Service Trainees; also participation through the World's Alliance of YMCA's in service to war prisoners on reciprocal permission in belligerent countries abroad, also national celebration of the 96th anniversary of YMCA founding by a Youth Service Project competition with awards presented by Mayor LaGuardia for the judges at the New York World's Fair.

**Young Women's Christian Associations of the United States of America**, established in 1906 to advance the physical, social, intellectual, and spiritual interests of young women. Membership: about 500,000. President: Mrs. Henry A. Ingraham. General Secretary: Miss Emma P. Hirth. Headquarters: 600 Lexington Avenue, New York City. In April, 1940, the 16th national triennial convention of the Y.W.C.A.'s of the U.S.A. was held in Atlantic City, N.J., bringing together 2200 delegates from 44 States, the Hawaiian Islands, and 10 foreign countries. By unanimous vote of this body, major emphasis in program during the coming triennium will continue to be on Religion, Democracy, and Building a World Community. An outstanding event of the convention was the observance of the 85th anniversary of the founding of the Y.W.C.A. in England, at which time a short radio talk by Queen Elizabeth of England was heard. During 1940 the Association in the United States continued financial assistance to the Y.W.C.A. in China, and also established a special fund for the purpose of helping Y.W.C.A.'s in Europe meet the heavy emergency demands created by the war. A temporary

office of the World's Council of the Y.W.C.A., headquarters in Geneva, Switz., was opened in Washington, D.C., in the autumn in order that communication with Associations throughout the world might be facilitated. In 1940 approximately 3,000,000 women and girls shared in the programs carried on by the 1400 local centers in the United States.

**Youth Commission, American**, formed in 1935 to investigate the problems of and develop a comprehensive program for the care and education of youth. Membership: 16. Chairman: Owen D. Young. Director: Floyd W. Reeves. Headquarters: 744 Jackson Place, Washington, D.C. During 1940 the Commission conducted (in co-operation with the American Institute of Public Opinion) a poll of public opinion on youth and education. Recommendations were made for public and private action in the fields of occupational adjustment of youth, community responsibility for youth, youth organizations, and youth and defense. Publications of the year were in the field of Negro and rural youth, occupational adjustment, community responsibility for youth, and the high school curriculum. Forthcoming publications are planned in the fields of recreation, family living, and work camps. See **EDUCATION**; **YOUTH MOVEMENT**.

**Youth Congress, American**, established in 1934 to serve as a co-operating center and a clearinghouse for all youth and youth-serving organizations. Membership organizations estimated to reach 4,500,000 young people. Chairman: Jack McMichael. Executive Secretary: Joseph Cadden. Headquarters: 230 Fifth Avenue, New York City; Washington Bureau, 907-15th Street, N.W., Washington, D.C. The Sixth Annual American Youth Congress was held at Lake Geneva, Wis., July 3-7, 1940. A National Youth Citizenship Institute was conducted in Washington, D.C., February 10-12. See **YOUTH MOVEMENT**.

**Youth, National Foundation for American**. See **YOUTH MOVEMENT**.

**Youth Needs, Campaign for**. See **YOUTH MOVEMENT**.

**Zionist Organization of America**, founded in 1897 to enlist public support for the upbuilding of a Jewish national homeland in Palestine and to foster a program of Jewish renaissance. Membership 50,000. President: Edmund I. Kaufman. Executive Director: Rabbi Isadore Breslau. Headquarters: 1720-16th Street, N.W., Washington, D.C. The destruction of European Jewish communities thrust upon the American Zionist Organization the sole responsibility for continuing the upbuilding of the Holyland. During 1940 headquarters were moved from New York City to Washington and a campaign for 150,000 members was launched. The 44th annual convention will be held in July, 1941.

**Zionist Organization of America, Women's**, listed under *Hadassah*.

**Zonta International**, a classified service club for women executives, organized in 1919 to encourage high ethical standards in business and to improve the legal, professional, economic, and political status of women. Membership about 4500. President: Mrs. May Moyers McElroy. Executive Secretary: Miss Harriet C. Richards. Headquarters: 59 E. Van Buren Street, Chicago, Ill. A new district was organized in 1940—District 5, comprising the States of Texas, Oklahoma, Arkansas, and Louisiana. The 20th Annual Convention was held at Estes Park, Colo., in June, and Zonta Week was observed November 3-8. The Amelia Earhart Scholarship for post-graduate study in aeronautical engineering was awarded to Miss Rose E. Lunn, a student at Massachusetts Institute of Technology. The 21st convention will be held at Memphis, Tenn., June 18-21.

**SOIL CONSERVATION SERVICE**. The Soil Conservation Service is helping farmers and public agencies to attack a wide variety of physical land problems, with a view to advancing social and economic conditions through control of erosion, conservation of rainfall, and desirable adjustments in the use of agricultural land.

An increasing amount of the Service's work in 1940 has been, and will continue to be, concentrated in local soil conservation districts. These local subdivisions of the States, organized by farmers under State law, have now been established in 38 States. Upon request, the Service goes into a district and plays an active part in its operations program on the land. It helps make preliminary surveys and assigns a technical staff to aid the farmers in developing and carrying out soil con-

servation plans. In addition, the Service may make equipment available, provide seed and seedlings for erosion control plantings, and furnish CCC labor to assist in getting conservation work started. On Nov. 1, 1939, the Service was extending active assistance to 148 districts covering approximately 83,000,000 acres; twelve months later, field technicians were stationed in 274 districts, comprising 165,000,000 acres. In these districts, more than 29,000 farm conservation plans were made during 1940, and field work was started on approximately 6,000,000 acres.

Closely related to the work in co-operation with soil conservation districts is the operation of erosion control demonstration projects. While the number of demonstration projects and number of CCC camps working on private lands remained unchanged, conservation operations were initiated on 6000 additional farms comprising about 1,500,000 acres in project and camp areas.

At the close of the year, erosion control work under the Service's guidance in projects, camps, districts, and other areas was either completed or under way on nearly 120,000 farms, covering more than 30,000,000 acres and located in every State, Hawaii, and Puerto Rico.

In its work of relieving social and economic maladjustments in rural areas by purchasing land unsuited to cultivation and developing it for some better adapted use, such as forestry, grazing, or wildlife, the Service this year purchased approximately 1,500,000 acres of land. Development operations were completed on approximately 3,000,000 acres. A total of approximately 11,000,000 acres have been purchased under this program.

The development of small water facilities, authorized by the Pope-Jones Act of 1937 for the 17 arid and semi-arid western States, progressed notably this year. With the Soil Conservation Service giving technical guidance, and the Farm Security Administration furnishing financial help, facilities such as wells, windmills, stock ponds, and water-spreading systems were constructed or repaired on more than 1600 farms and ranches. By the end of the year assistance under the water facilities program had been extended to some 3800 families, representing approximately 2,000,000 acres of land.

Flood control work on the land, involving treatment for erosion control and waterflow retardation, began in the latter part of the year on the watershed of the Los Angeles River in southern California. The Service is collaborating in this work with the Forest Service and the Bureau of Agricultural Economics. The three agencies have now completed preliminary examinations of 141 major watersheds, and detailed surveys are completed or under way in 41 of these to provide a basis for actual operations.

The year brought a great increase in the number of farm forestry projects established in predominantly agricultural areas. In these projects, the Service helps farmers build up their woodlands, both for income production and erosion control. At the same time, farmers are assisted in the development of conservation plans for crop lands and pastures. During the year 32 projects were started. So far, 35 farm forestry projects have been established in 31 States.

Under the supervision of the Service, 39 CCC camps are engaged in farm drainage work in 11 States. The enrollees work in public drainage districts clearing out ditches, repairing tile drains, and making other improvements in existing drain-

age systems. To date, about 9500 miles of ditches, and 345 miles of tile have been strengthened and improved.

Surveys of agricultural land to determine the type of soil, amount of slope, degree of erosion, and present use of the land are an essential preliminary to most of the Service's work. Lands surveyed in soil conservation districts and demonstration areas are classified as (1) suitable for cultivation without special practices, (2) suitable for cultivation with simple erosion control practices, (3) suitable for cultivation with complex or intensive practices, (4) suitable for uses that may involve short periods of cultivation, or (5) not suitable for cultivation. During the year, surveys were completed over 38,755 square miles, bringing the total area surveyed by the Service to approximately 62,500 square miles.

In addition to its action work on the land, the Service is also conducting a comprehensive program of research. Problems connected with soil conservation, flood control, farm drainage, and irrigation are being investigated in co-operation with State Agricultural Experiment Stations and to some extent with other Federal Bureaus at 127 field stations about the country. Significant research findings are used to implement the Service's operations program, and are made available to other agencies and to the public generally.

On July 1, 1940, soil conservation work on Federal lands such as Indian reservations and public domain areas was transferred by order of the President from the Soil Conservation Service to the Department of the Interior. Under this reorganization, the latter Department is charged with the responsibility for erosion control and water conservation work on all lands under its own jurisdiction. The Soil Conservation Service, however, will continue its operations on privately owned lands and on public lands not administered by the Interior Department.

HUGH H. BENNETT.

**SOILLESS AGRICULTURE (HYDROPONICS).** See BOTANY.

**SOILS AND SOIL CONSERVATION.** See AGRICULTURAL ADJUSTMENT ADMINISTRATION; AGRICULTURAL CHEMISTRY AND ENGINEERING, BUREAU OF; FERTILIZERS. KENTUCKY under *History*; LAND UTILIZATION, OFFICE OF.

**SOLOMON ISLANDS.** See AUSTRALIA; BRITISH EMPIRE.

**SOMALILAND, British.** A British protectorate in Africa, along the south shore of the Gulf of Aden; conquered by Italy during August of 1940. Area, 68,000 square miles; population (1938), 350,000, including 2700 non-natives. Chief towns: Berbera (capital), Hargeisa, Burao, Zeila, Erigavo.

**Production and Trade.** Chief agricultural crops: barley, maize, sorghum, wheat. Livestock raising was the principal occupation of the people. Livestock (1936 estimate): 2,500,000 sheep, 2,000,000 goats, 1,500,000 camels, 30,000 cattle, 2000 donkeys, and 1000 horses. Trade (1938): imports, £728,050 (cotton piece goods, dates, rice, and sugar were the main imports); exports, £207,548 (sheep, goats, skins, myrrh, and frankincense were the chief exports). Shipping entered in 1938 totaled 169,643 tons.

**Government.** Finance (1938): revenue, £206,074; expenditure, £227,341. Free grant-in-aid (1938) totaled £30,000. Under British rule the protectorate was administered by a governor (whose headquar-

ters were at Sheikh) and he was represented by a district officer in each of the administrative districts.

For the military campaign resulting in the British withdrawal in 1940, see *EUROPEAN WAR under Campaigns in Africa*; *ITALIAN EAST AFRICA under History*.

**SOMALILAND, French.** A French colony in Africa, at the southern entrance to the Red Sea. Area, 8492 square miles; population (1936 census), 44,240, including 27,380 Somalis, 4200 Arabs, 12,000 Danakils. Djibouti, the capital, had 20,000 inhabitants in 1939.

**Production and Trade.** The chief occupations of the people were fishing, salt mining, and the transit of goods to and from Italian East Africa. Trade (1938): imports, 147,700,000 francs (the chief imports were cotton yarns, cotton goods, cattle, coal, and sugar); exports, 85,300,000 francs (the main exports were coffee, hides, and salt). The 1938 transit trade was valued at 521,563,195 francs (franc averaged \$0.0288 for 1938; \$0.0251 for 1939). Shipping entered at Djibouti in 1938 totaled 2,823,096 tons. There is a railway from Djibouti to Addis Ababa, Italian East Africa, 496 miles in length.

**Government.** Finance (1939) · revenue and expenditure were estimated to balance at 26,000,000 francs in the local budget. A governor, assisted by an administrative council, controlled the government of French Somaliland.

**History.** The Italo-French armistice of June 24, 1940, provided for demilitarization of the French Somaliland coast for the duration of the war, the evacuation of French troops from the coastal zone, the surrender of their arms, and full Italian control and use of the port of Djibouti and of the Somaliland section of the French-owned Djibouti-Addis Ababa railway. General Gentilhomme, Governor of French Somaliland and commander-in-chief of the Anglo-French forces in French and British Somaliland, repudiated the Vichy Government's surrender and joined the "Free French" forces of Gen. Charles de Gaulle. He was unable to win the colony over to his course, however, and at the end of July General Germain took command of the French military forces and the civil administration on behalf of the Vichy regime. Shortly afterwards Italian forces from Italian East Africa entered the southern part of French Somaliland without opposition and used it as a base for their successful invasion of British Somaliland in August.

The Italian military commission charged with applying the terms of the armistice in French Somaliland arrived in Djibouti on August 31. It was reported to have received a hostile reception from the civilian populace. Early in September General Germain turned over the civil administration of the colony to M. Nouillat, an official from French Indo-China, and the military command to General Aymé. The British applied their naval blockade to the colony when it adhered to the Vichy Government and it was reported in October that a serious food shortage had developed.

See *FRANCE and ITALIAN EAST AFRICA under History*; *EUROPEAN WAR under Campaigns in Africa*.

**SOMALILAND, Italian.** See *ITALIAN EAST AFRICA*.

**SOUTH AFRICA, Union of.** A self-governing dominion composed of former British colonies in the southern part of Africa and ranking as a member of the British Commonwealth of Nations.

Capital, Pretoria (seat of administration); Cape Town (seat of the Legislature).

**Area and Population.** The area by provinces and the population by provinces and racial composition as officially estimated for June 30, 1939, are shown in the accompanying table.

SOUTH AFRICA AREA AND POPULATION  
[Estimated, June 30, 1939]

Province	Area, sq. miles	Europeans	Bontus	Asiatics & mixed
Cape of Good Hope	277,169*	818,700	2,130,400	734,900
Natal	35,284	199,200	1,640,800	212,200
Transvaal	110,450	897,600	2,645,400	81,200
Orange Free State	49,647	201,000	580,900	17,700
Total	472,550	2,166,500	6,997,500	1,046,000

\* Including Walvis Bay (430 sq. miles)

The census population of May 5, 1936, totaled 9,589,898 (European, 2,003,857; non-European, 7,586,041), as compared with a total estimated population of 10,160,000 (European, 2,116,500; non-European, 8,043,500) on June 30, 1939. European births registered in 1939 numbered 53,805 (25.4 per 1000); deaths, 19,846 (9.4 per 1000). Populations of the chief cities, including suburbs, at the 1936 census were, with the number of Europeans in parentheses: Johannesburg, 519,384 (257,671); Cape Town, 344,233 (173,412); Durban, 259,606 (95,033); Pretoria, 128,621 (76,935); Port Elizabeth, 109,841 (53,461); Germiston, 79,440 (32,564); East London, 60,563 (31,311); Bloemfontein, 64,233 (30,291). The same census showed that the home language of 1,120,770 persons (55.93 per cent of the European population) was Afrikaans, 783,071 (39.08 per cent) English, 50,411 (2.52 per cent) English and Afrikaans, 17,810 German, and 17,684 Yiddish.

**National Defense.** For defensive measures taken in the course of South African participation in the European War see *History*, below. Reports prior to Nov. 1, 1940, credited South Africa with 5000 active in armed service and a reserve of 15,000 trained in military service but inactive; combined total, 20,000; in air service, 1500 of the active troops. Citizens of European descent are liable to serve in war from the age of 17 years to 60; those under 25 years of age are liable also to periods of military training. Before the European War the statutory permanent force had, June 30, 1939, 287 officers and 4997 men, including 1568 in the South African Air Force. The Department of Defense estimated its expenditures for 1938-39 at £1,797,530 (South African). A feature of the military skill of the people is a system of rifle associations in which citizens not entered for active training but still under the age of 25 years get practice in the use of the rifle. In 1939 the rifle associations had 124,131 members. A South African Naval Service was maintained and had in 1939 headquarters at Simonstown.

**Education and Religion.** State-conducted and State-aided public schools numbered 4471 in 1937 for pupils of European stock and 4850 for others; pupils numbered, respectively, 381,550 and 546,225. Normal expenditures of these schools, 1939, £9,354,422, S.A. At Cape Town, Stellenbosch, Witwatersrand, and Pretoria are four universities; that at Pretoria, the University of South Africa, a Federal body, conducts five colleges in different parts of the Union. Universities' students numbered, in 1937, 8707. According to the census of 1936 the religious affiliations of people of European descent were chiefly: Dutch churches, 1,088,826;

Anglican, 345,103; Presbyterian, 82,283; Methodist, 140,658; Roman Catholic, 92,352; Jewish, 90,662.

**Production.** South Africa grows, for export, wool and other animal products, sugar, citrus fruits, and cereals. Its mines produce principally gold; also diamonds and several base metals. Its manufactures are largely engaged in processing its products and in providing what cannot readily be imported. The production of gold, the Union's greatest single source of wealth, increased under the influence of the European War; Great Britain supplied an eager market for the output. From 12,819,344 troy oz. for the calendar year 1939, itself a new maximum of yearly production, the yield of gold mounted to more than 14,000,000 oz. for 1940 (by early approximation). In terms of U.S. money these totals represented, in value of gold, respectively some \$450,000,000 and over \$490,000,000. Much of the value went to pay the workers on the mines and metallurgical works; mines paid an estimated \$12,000,000 in dividends in 1939, of which some \$8,500,000 was believed to have gone to stockholders in South Africa; another great sum went to pay South African taxes and the Union's appropriation of some \$5,000,000, the excess of producers' receipts over the 150 shillings an oz. guaranteed by the British Government. Production of other minerals included (1938) coal, 17,536,230 tons (\$4,729,423); diamonds, 1,238,608 metric carats (\$3,496,243); manganese ore, 422,757 tons (\$560,602). See also **GOLD**.

Production from farms, for the world's markets, was dominated by wool. The total output of wool, for the year ended with June 30, 1940, attained some 793,415 bales; this lacked somewhat of the total for the year previous. Most of it went into exports. About 5,000,000 boxes of citrus fruits are produced yearly for the foreign market. See also **DAMS**; **INDUSTRIAL CHEMISTRY**.

**Foreign Trade.** Imports of 1939 totaled \$91,341,108; exports, \$34,196,010, not to count gold. The chief articles of export, other than gold, were: wool, \$7,256,301; citrus fruits, \$1,667,855; hides and skins, \$1,737,630; sugar, \$1,840,518; diamonds, \$1,861,441. Chief imports were electrical machinery and material, \$4,210,573; foodstuffs, \$4,840,651; cotton piece goods, \$3,999,703; and great aggregates of machinery and textiles diversely classified. The United Kingdom sent \$37,203,000 of the imports of 1938 and took \$58,791,000 of the exports; the United States and Germany followed in importance.

**Finance.** The unit of money is the South African pound; its value in U.S. money averaged \$4.4017 for 1939 and \$3.98 for 1940. The Union's budget as prepared for the year 1940-41 totaled \$57,255,000 and included \$14,000,000 of special war-time expenditure. It involved expected issue of some \$22,500,000 of debt. A second budget for the same year, presented on August 28, called for military-expenditure of \$32,938,000, the issue of \$23,616,000 in bonds, and an increase of 20 per cent in the income tax. The Union's public debt was stated, Feb. 28, 1940, as \$102,700,000 external and \$184,300,000 internal. For the fiscal year ended with Mar. 31, 1940, the budget anticipated revenues of \$44,442,014 and expenditures of \$44,110,000; but the year ended with a surplus of \$1,050,000.

**Transportation.** Railway mileage in the Union and in South-West Africa on Mar. 31, 1938, totaled 13,620 (government, 13,213; private, 407). For the year ended Mar. 31, 1939, the Minister of Railways and Harbors estimated revenues at \$38,-

240,437 and expenditures at \$39,889,025. The highway mileage in 1939 was 88,949. A six-year program calling for the construction of 5400 miles of national roads at a cost of some \$20,000,000 was started in 1936. Up to Dec. 31, 1938, 1227 miles of these highways were constructed. The sum of \$4,500,000 was appropriated for continuation of this program during 1939-40. The South African cities are linked with Egypt, Europe, and London by Imperial Airways. The South African Airways, operating six services, carried 34,162 passengers and 3,005,639 lb. of freight and mails in 1938. During 1938 6182 vessels of 24,869,085 net registered tons entered the ports. See **PORTS AND HARBORS**.

**Government.** Executive power is exercised by the Governor General, appointed by the King on recommendation of the South African government, and by the Executive Council (cabinet), which is responsible to Parliament. Parliament consists of a Senate of 44 members (8 appointed by the Governor General and 36 elected) and a House of Assembly of 153 members, elected by white male and female suffrage for five years unless sooner dissolved. Governor General in 1940, Sir Patrick Duncan (assumed office March, 1937).

The line-up in the House of Assembly following the September, 1939, split in the United South African National party over participation in the European War was: National Government bloc, 85 (Smuts wing of United party, 69; Dominion party, 9; Labor party, 4; Native representatives, 3); Hertzog wing of United party, 39; Malanites, 29. Prime Minister, Minister of External Affairs, Minister of Defense, Gen. Jan. C. Smuts, who replaced Prime Minister J. B. M. Hertzog on Sept. 5, 1939. Other members of the cabinet were: Native Affairs, Deney's Reitz; Finance and Education, J. H. Hofmeyr; Commerce and Industries, R. Stuttaford; Agriculture and Forestry, Col. W. R. Collins; Interior and Public Health, H. G. Lawrence; Railways and Harbors, F. C. Sturrock; Posts and Telegraphs, Public Works, Sen. C. F. Clarkson; Labor and Social Welfare, W. B. Madeley; Lands, Sen. A. M. Conroy; Justice, Dr. Colin F. Steyn; Mines, Col. F. C. Stallard; Minister without Portfolio, Maj. P. V. G. Van der Byl.

#### HISTORY

**The Political Conflict.** The bitter controversy between the pro-war and anti-war elements in South Africa that broke out in September, 1939 (see **YEAR BOOK**, 1939), continued with mounting intensity during 1940. After declaring war on Germany on Sept. 6, 1939, Prime Minister Smuts had prorogued Parliament until January, 1940, and governed through a series of emergency decrees. When Parliament reassembled on Jan. 19, 1940, the Governor General announced that it would be asked to confirm the declaration of war and grant the government further powers for carrying on the struggle. General Hertzog, leader of the anti-war groups, immediately introduced a motion in the House of Assembly calling for termination of the state of war and adoption of a neutrality policy by the Union.

After five days of debate, the Hertzog motion was defeated on January 27 by a vote of 81 to 59. The debate was marked by a speech of General Hertzog defending Hitler and by Prime Minister Smuts' reply that South Africa could not withdraw from the war without sacrificing both its honor and its vital interests. Dr. D. F. M. Malan, leader of the Nationalist Republican party, supported the Hertzog motion and in addition de-

mandated that South Africa sever all connections with Great Britain immediately. Previously his party had stood for the "eventual" formation of a republic. He attacked General Smuts as leader of the English-speaking South Africans, who were "letting down" the Afrikaners by "playing the Empire's game." Former Defense Minister Pirow, supporting General Hertzog, warned Prime Minister Smuts that there would be serious consequences if South African troops were sent out of the country.

Following defeat of their motion, General Hertzog and Dr. Malan on January 28 agreed, subject to approval by the entire membership of both groups, to merge their parties as the Reunited Nationalist or People's party. They issued a statement asserting that "a republican form of government, separated from the British Crown, is best suited to the traditional aspirations of the South African people" and the only effective guarantee that South Africa would not be drawn again into Britain's wars. At General Hertzog's insistence, the statement declared a republic could be achieved only with the consent of the nation and on a basis of equal language and cultural rights for both the Boer and British elements of the population.

The Malan bloc, however, showed growing unwillingness to abide by this formula. In July the Malanites announced plans for a mass meeting "to consider active constitutional steps to establish a republic." General Hertzog curtly refused to participate in a step that seemed likely to lead to civil war. When the inaugural Congress of the new Nationalist party met early in November, the Malan group deleted the clause in the party platform calling for equal treatment for English- and Afrikaans-speaking South Africans. General Hertzog then left the new party and on December 12 he and his former Finance Minister, N. C. Havenga, announced their resignation from Parliament and retirement from party politics. There was a split among Hertzog's adherents, with some joining the Malanite movement for a Boer-dominated republic and others supporting the government bloc. This and the simultaneous British victory over the Italians in North Africa strengthened the position of the Smuts Government.

In the meantime, General Hertzog had continued his fight against Prime Minister Smuts' war policy. The latter, in support of his contention that Germany aimed at the reconquest of South-West Africa as a part of its plan for world domination, made public on February 7 further data concerning Nazi activities in both the Union and in South-West Africa. He said the funds collected—sometimes by threat and intimidation—from persons of German birth or extraction in these territories "for relief in Germany" had been retained by the Nazis for propaganda and other purposes in South Africa. He charged the Nazis with giving financial assistance to South African Fascist movements such as the Gray Shirts, who carried on an active anti-Jewish propaganda in rural districts.

General Smuts told Parliament that Kenya and Tanganyika were northern outposts of the Union, and that if need arose South Africa would give military aid to British territories right up to the Equator. He added that while South Africa could not remain disinterested regarding the future of the British colonies on the north, that did not necessarily preclude the ultimate establishment of another British Dominion in that part of Africa.

The German invasion of the Netherlands on May 10 caused some of General Hertzog's influ-

ential Afrikaner followers to switch their support to Prime Minister Smuts. Sensational Nazi military successes led the Prime Minister in mid-May to appeal to all citizens to support the government's firm policy. He declared there were some signs of subversive movements and warned that the government was setting up a special organization to deal strongly with the remnants of the "fifth column." He also warned a section of the press to cease helping the enemy under the guise of politics.

The day after Italy's entrance into the war, Prime Minister Smuts broadcast an announcement that South Africa was at war with Italy. Parliament was not consulted. About 200 Italians residing in the Union were interned and many more Germans were rounded up. On June 15 the Prime Minister assumed direct command over all South African defense forces. Three days later it was announced that a "small military force" had been sent to the border of Portuguese Mozambique as a "precautionary measure." On the same day the Prime Minister in a radio broadcast again pledged full support of Britain. He pointed out that Italy's action had brought the war closer to South Africa and that the Union's danger as a valuable economic and strategic prize was very great.

The collapse of France stirred the anti-war groups in South Africa to new efforts. On June 24 General Hertzog and Dr. Malan issued a joint letter, demanding the immediate summoning of Parliament and withdrawal from the war. On June 28 demonstrations called by General Hertzog were held in many centers of the Union and resolutions were passed urging the government to seek an "honorable peace" with Germany and Italy "without delay." One resolution asked the people to disobey a government order commandeering all rifles of military pattern.

Undeterred by this opposition, the government proceeded to speed up war preparations and extend further aid to the hard-pressed British. The opposition demand that Parliament be summoned was granted. When the legislators assembled at the end of August, General Hertzog again introduced his motion for immediate withdrawal from the war. He asserted that the war was already lost, that Britain stood no chance against the combined German and Italian forces, and that the patience of the Afrikaners with the government's "senseless policy" was nearing its limit.

General Smuts replied that the government would not be "deflected from our course by Hitler's victories or glorification of Germany." He declared there was every prospect of a British victory and said South Africa would fight on until that victory was achieved. On August 31 the House of Assembly upheld the government's policy, 83 to 65. On September 5 it passed by a majority of 24 votes the War Measures (Amendment) Bill, granting the government full powers to act on all matters connected with the war. The only exceptions made barred enforcement of the conscription powers in the Defense Act or infringement upon the rights and privileges of Parliament.

**War Contribution.** The preparations for military and economic support of the British war effort made in 1939 (see *YEAR BOOK*, 1939) were steadily expanded throughout 1940. In April the Union made available its air-training facilities to the Royal Air Force. A British air mission under Air Chief Marshal Sir Robert Brooke-Popham was sent to South Africa to supervise the joint

training of air recruits from South Africa, the British Isles, and the British colonies in Africa.

The South African Air Force began to play a part in actual warfare in East Africa immediately after Italy entered the conflict. Beginning July 14, a steady flow of troops and equipment from South Africa was concentrated in Kenya to prevent an Italian drive southward from Ethiopia and to relieve British troops for services in other parts of Africa. Under the direction of Hendrik van der Byl, Director-General of War Supplies, remarkable progress was made in mobilizing industry for the production of war material of all kinds. Military explosives, shells, air bombs, grenades, rifle ammunition, trench-mortars and guns, armored cars and other military vehicles, uniforms, boots, blankets, tinned food, and other equipment were turned out in large quantities. Part of this output went to supply British armies in Egypt and Palestine, thus relieving the strain on British industry.

A South African purchasing mission was sent to the United States to buy airplane engines, machine guns, and the more complicated types of artillery not produced in South Africa. Other armaments of this kind were obtained in Great Britain. At the same time preparations were rushed in South Africa for a greatly expanded economic production in the event the war spread to the nearby Portuguese and Belgian colonies. The first textile factories in South Africa were constructed by the Director-General of War Supplies' office.

A dozen other plants were built for the production of war supplies. The Iscor steel plant, opened at Pretoria in 1935, was expanded to a capacity of 440,000 ingot tons yearly, and a new steel plant was authorized. Construction of small freighters for service in African waters was begun. Schools were established for the training of thousands of additional industrial workers. The co-operation of both labor and capital was obtained, the manufacturers producing on the basis of cost plus a small percentage and the labor unions agreeing to eliminate strikes and job changing for the duration of the war. Four labor representatives, paid by the unions, worked in the Department of War Supplies to insure an adequate supply of labor for the factories. A Commandeering Law published May 25 permitted the requisitioning of buildings, supplies, foodstuffs, forage, horses, vehicles, and other articles necessary for maintaining the defense forces in the field.

A South African delegation was sent to the conference of British Dominions and colonies of the Middle and Far East, held in New Delhi, India, beginning October 25. Its objective was to coordinate and increase the flow of war materials and supplies to the Allied armies in Africa, the Near East, and the British Isles. On October 27 Prime Minister Smuts flew to Khartoum in the Anglo-Egyptian Sudan to confer with Anthony Eden, British Minister for War, who was inspecting preparations to meet the expected Italo-German drives toward the Suez Canal and the oil fields of Asia Minor.

**Other Economic Measures.** While the war proved a decided stimulus to the Union's industrial and mining enterprises, agriculture was adversely affected by the loss of European markets, particularly in France. The conflict also imposed a severe strain upon the government's finances, despite the sound position of the Treasury at the outbreak of war. The government took various measures to adjust the Union's economy and finances to the new situation.

To prevent the slowing up of defense industries through raw material shortages, the government in March obtained first claim on incoming cargo space from the British shipping authorities, and in return agreed to buy in Great Britain and the Empire whenever possible. In the budget estimates announced for 1940-41, several million pounds were set aside for the establishment of a new Industrial Development Corporation to aid the establishment of selected private industrial enterprises.

A revision of the system of taxing the gold mining industry was introduced in connection with the 1940-41 budget. The levy on sales of gold at prices above 150 shillings per ounce was withdrawn. Gold miners operating at a narrow margin of profit obtained relief while taxes were increased on high-profit mines. Under an agreement announced April 22, the Bank of England, acting for the British Treasury, undertook to buy all South Africa's gold output from the Union Government at the full official price. The Union Treasury's profit on this transaction was estimated at £2,000,000 or more annually.

With the proceeds of heavy taxes levied on the mining industry, the government extended large subsidies to agriculture. The farms suffered from a labor shortage as a result of recruiting and the rapidly increasing employment of native labor in the mines. To check this trend, the government relaxed its restrictions upon the importation of native mine labor from Mozambique. A Moratorium Act was promulgated for the benefit of volunteers serving with the military forces. Government control was extended over transactions in South African securities and foreign currencies. Arrangements were made with the British Government for the sale of South Africa's entire wool clip during the war and for a year thereafter.

**SOUTH AMERICA.** A continent comprising 10 republics (Argentina, Bolivia, Brazil, Chile, Colombia, Ecuador, Paraguay, Peru, Uruguay, and Venezuela) and three colonies (British Guiana, French Guiana, and Surinam). Total area, about 6,934,356 square miles; population, 91,300,000 (Dec. 31, 1938 estimate). See EXPLORATION; PAN AMERICANISM; PAN AMERICAN UNION; and separate articles on each country and colony.

**SOUTH AUSTRALIA.** A State of Australia. Area, 380,070 square miles; population, exclusive of full blood aborigines, 597,387 (Mar. 31, 1940, estimate). Vital statistics (1939): 9618 births, 5739 deaths, 5670 marriages. Chief cities: Adelaide (322,990 inhabitants on Dec. 31, 1939), Port Pirie (11,677 in 1933), Mount Gambier (5542). Education (1938): 1077 State schools and 83,277 students; 184 private schools and 16,356 students; there is a State university at Adelaide.

**Production.** Chief agricultural products: Wheat (40,984,726 bu. in 1939-40), barley, oats, hay, grapes, wine, dried fruits. Livestock (1939): 9,940,570 sheep, 351,013 cattle, 190,013 horses, 119,660 pigs. Dairy output (1938-39): 20,716,584 lb. of butter, 18,457,598 lb. of cheese, 5,987,363 lb. of ham and bacon. Wool, as in the grease (1940): 102,000,000 lb. Mineral production (1938) was valued at £2,932,473, including ironstone (£2,582,171) and gold (£46,922). Manufacturing (1938-39): 2067 factories, 43,371 employees, £13,678,930 net value of production (Australian £ averaged \$3.8955 for 1938; \$3.5338 for 1939). There were 2558 route miles of railway on June 30, 1939.

**Government.** Finance (1939-40): Revenue, £12,756,000; expenditure, £12,919,000; public debt, £109,344,000. Executive power rests with a gov-

ernor, assisted by a council of responsible ministers. There is a parliament consisting of a legislative council of 20 members (10 re-elected every 3 years) and a house of assembly elected for a 3-year term. Governor, Sir Malcolm Barclay-Harvey (appointed Mar. 2, 1939); Premier, Thomas Playford.

**History.** It was announced on Aug. 7, 1940, that the public works committee of the State legislature had recommended the expenditure of £3,122,000 to build a pipe line (235 miles long) from Morgan on the Murray River to Whyalla on Spencer's Gulf to provide 1,200,000,000 gallons of water annually for Whyalla and 900,000,000 gallons for the intervening northern districts.

**SOUTH CAROLINA.** Area, 30,989 square miles; includes water, 494 square miles. Population (U.S. Census), April, 1940, 1,899,804; 1930, 1,738,765. Charleston (1940), 71,275; Columbia, the capital, 62,396. The urban population of the State rose (1930-40) by 95,031, to 466,111; the rural, by 66,008, to 1,433,693.

**Agriculture.** South Carolina's harvest of 1940 covered 5,124,000 acres of the principal crops; nearly three-fifths bore cotton or corn. Cotton, on 1,242,000 acres, grew 970,000 bales (\$47,045,000 in estimated return to the cultivators); corn, 1,736,000 acres, gave 24,304,000 bu. (\$17,985,000); tobacco, 82,000 acres, 81,590,000 lb. (\$12,565,000); tame hay, 730,000 acres, 539,000 tons (\$7,276,000); oats, 495,000 acres, 10,890,000 bu. (\$5,227,000); sweet potatoes, 63,000 acres, 5,040,000 bu. (\$3,780,000); potatoes, 28,000 acres, 3,192,000 bu. (\$2,745,000); wheat, 215,000 acres, 2,688,000 bu. (\$2,365,000); peaches, 1,915,000 bu. (\$2,202,000).

**Education.** For the academic year 1939-40, the number of South Carolina's inhabitants of school age (from 6 years to 20, inclusive) was stated as 677,587. Of the 481,750 reported enrollments in the public schools for that year, those of pupils in the elementary studies comprised 196,308 whites and 198,642 Negroes; in high schools, 69,537 whites and 17,263 Negroes. The year's expenditures for public-school education totaled, for whites \$14,975,108; for Negroes, \$2,570,226. The teaching force, 9662 whites and 5660 Negroes, averaged respectively, in pay for the year, \$978 and \$391.

**History.** More or less dissatisfaction with the State's still recent abandonment of prohibition of alcoholic beverages for a system of licensed liquor stores caused pressure on the Legislature to restore prohibition. The lawgivers passed an act calling for an advisory referendum vote of the people. This vote was cast at the State primary elections, much more widely attended than the general elections in November. The result (August 27) was a majority of about 3 to 2 for prohibition in a total of nearly 300,000, which approximated 30 per cent of the State's white population. Further action, if any, awaited the next session of the Legislature.

Against the opposition of U.S. Senator E. D. Smith, a pronounced anti-New Dealer, the State's Democratic convention voted (May 15) by more than 2 to 1, in favor of nominating President Roosevelt for a third term.

At the general election (November 5) the popular vote for President totaled 95,470 for Roosevelt (Dem.) and 4360 for Willkie (Rep.). Six Democrats, all incumbents but one, were elected U.S. Representatives. No State officers and no U.S. Senator were elected. Of the popular vote for Willkie given above, a considerable part (1727) was not Republican, but was cast for a separate and alto-

gether different list of electors under the designation of Jeffersonian Democrats.

**Officers.** South Carolina's chief officers, serving in 1940, were: Governor, Burnet R. Maybank (Dem.); Lieutenant Governor, J. E. Harley; Secretary of State, W. P. Blackwell; Treasurer, Jefferson B. Bates; Attorney General, John M. Daniel; Comptroller, A. J. Beattie; Superintendent of Education, James H. Hope.

**SOUTH DAKOTA.** Area, 77,615 square miles; includes water, 747 square miles. Population (U.S. census), April, 1940, 642,961; 1930, 692,849. Sioux Falls (1940), 40,832; Pierre (the capital), 4322. While the population of the State as a whole decreased (1930-40) by 49,888, the urban population, going against that trend, increased briskly, by 27,180, to 158,087, almost all the incorporated places of 2500 or over partaking in the increase; the rural majority of the population diminished by 77,068, to 484,874.

**Agriculture.** South Dakota's harvest of 1940 covered 13,652,000 acres of the principal crops. More than half of the area bore corn, wheat, and oats. Corn, on 2,784,000 acres, made 50,112,000 bu. (\$28,063,000 in estimated value to the cultivator); wheat, 2,707,000 acres, gave 26,221,000 bu. (estimated at \$17,306,000); oats, 1,936,000 acres, 53,240,000 bu. (\$11,180,000). Among other crops were barley, 1,666,000 acres, 30,821,000 bu. (\$10,171,000); tame hay, 778,000 acres, 765,000 tons (\$3,596,000); flaxseed, 293,000 acres, 1,904,000 bu. (\$2,456,000); rye, 470,000 acres, 5,640,000 bu. (\$1,861,000); grain sorghums, 443,000 acres, 3,544,000 bu. (\$1,559,000); potatoes, 32,000 acres, 2,016,000 bu. (\$1,210,000).

**Mineral Production.** More than nine-tenths of the minerals produced in South Dakota in 1938 was due to gold mined in the Black Hills. The remainder was mainly such stone, sand, and gravel as would meet needs in the State. The recoverable gold material mined in 1940, according to preliminary estimate, totaled 592,936 oz., valued at \$20,752,760, as against the total for 1939 of 618,536 oz., \$21,648,760. The gold ore contained, in each of the years of 1939 and 1940, silver valued in excess of \$100,000. About nine-tenths of the yearly total of gold continued to come from the ores of the Homestake Mine, in Lawrence County.

**Education.** For the academic year 1939-40 South Dakota's inhabitants of school age were reckoned at 186,251: of these, 135,597 were between 6 and 17 years old; the rest, between 17 and 21. Enrollments of pupils in public schools during the year numbered 136,447; of these, 98,441 in elementary study and the rest, 38,006, in high school. The year's expenditure for public-school education totaled \$12,312,609. The teachers, 8014, averaged in year's pay, \$757.86 for elementary and \$1020.81 for high-school positions.

**History.** The decline in the total of population between 1930 and 1940 (see above), amounting almost to 50,000 set the highest rate of loss, somewhat over 7 per cent, for any of the six States of the Union whose populations had shrunk. While it pointed to adversity, its most obvious cause, the dry years and consequent crop failures that had coincided with the depressed prices, foreclosures, and insolvencies of the earlier 'thirties, had passed. Economic conditions in the State were again tolerable.

The State's credit sufficed to enable it in 1940 to carry out in full the operation, begun in 1939, of refunding \$20,425,000 of its rural-credit bonds. This operation effected what was known as the

level debt-service plan. It issued, in place of outstanding bonds that were to mature before 1950, other bonds maturing only in the decade thereafter. The new bonds paid the same interest as the old ones until dates when the old ones would have matured; thereafter the new ones were to pay only 3 per cent per annum. This still required the State to pay out yearly, for a good many years, at \$2,500,000 or more, but it relieved the finances of the risk that a great part of the debt might come due when it could neither be paid nor borrowed over again.

At the general election (November 5) the State's popular vote for President gave 177,065 for Willkie (Rep.) and 131,362 for Roosevelt (Dem.). Harlan J. Bushfield (Rep.) was re-elected Governor, defeating L. W. Bicknell (Dem.).

**Officers.** South Dakota's chief officers, serving in 1940, were: Governor, Harlan J. Bushfield (Rep.); Lieutenant-Governor, Donald C. McMurchie; Secretary of State, Olive A. Ringsrud; Treasurer, W. G. Douglas; Auditor, W. W. Warner; Attorney-General, Leo A. Temmey; Superintendent of Public Instruction, J. F. Hines.

**SOUTHERN RHODESIA.** See RHODESIA, SOUTHERN.

**SOUTH GEORGIA; SOUTH ORKNEY.** See FALKLAND ISLANDS.

**SOUTH POLE.** See POLAR RESEARCH.

**SOUTH-WEST AFRICA.** A territory administered by the Union of South Africa under a mandate from the League of Nations. Total area, including the Caprivi Zipfel, 317,725 square miles; population (1938), 365,000. The census of 1936 showed (exclusive of Walvis Bay) 357,787, including 261,724 natives and 30,677 Europeans (of whom 9632 were German speaking and of these 6244 were British or South African subjects). Chief towns: Windhoek (capital), 10,651 inhabitants in 1936, Luderitz, Keetmanshoop, Swakopmund, Walvis Bay. Education (1938): 11,373 students in the 180 schools of all kinds.

**Production and Trade.** Stock raising is the chief industry. Agriculture, owing to the low rainfall, is almost impossible—except in the northern and northeastern portions of the country. Livestock (1938): 908,061 cattle, 3,074,257 sheep, 1,420,322 goats, 28,164 horses. Chief minerals: diamonds, gold, iron, lead, tin, copper, vanadium, tungsten. Trade (1939): imports, £2,220,000; exports, £3,348,000 (South African £ averaged \$4.4017 for 1939).

**Government.** Budget (1940-41): revenue, £607,000 (£748,300 for 1939-40); expenditure, £813,000 (£824,657). South-West Africa is included in the South African Customs Union and a lump sum based on the customs and excise taxes on goods consumed in the territory is paid over to the administration. The Union of South Africa parliament has vested the administration of the territory in the governor-general of the Union, and he has placed his powers in the hands of an administrator who is assisted by an executive council, an advisory council, and a legislative council of 18 members (12 elected by the voters, and 6 appointed by the administrator and approved by the governor-general). Administrator, Dr. D. G. Conradie.

**History.** South-West Africa was divided during 1940 by the conflict between pro-war and anti-war factions that agitated the Union of South Africa. In elections to the Legislative Council held toward the end of February the United party, supporting Prime Minister Smuts and his pro-war policy, won 10 of the 12 elective seats. The other seats went to the Nationalists, who advocated the Hertzog-Malan anti-war policy and who had the

support of the German element in the colony.

Prime Minister Smuts on Feb. 7, 1940, gave out further information concerning the activities of the Nazi overseas organization in South-West Africa. He said the Nazi movement in the colony was organized on the cell basis, with its own secret newspaper and a party "arbitrator" who usurped the functions of the regular courts. The Nazi leaders in South-West Africa either fled or were interned upon the outbreak of war in 1939. Further precautions against an attempted coup by the Nazis were taken during 1940. See SOUTH AFRICA, UNION OF, under *History*.

**SOVIET UNION.** See UNION OF SOVIET SOCIALIST REPUBLICS.

**SOYBEANS.** The production of soybeans for beans in the United States in 1940 was estimated by the U.S. Department of Agriculture at 79,837,000 bu., 12.5 per cent below the 91,272,000 bu. of 1939,\* and compared with the 1929-38 average of 27,318,000 bu. New high records were established again in 1940 for total acreage with 10,528,000 acres and acreage harvested for beans 4,961,000 acres versus 9,506,000 and 4,417,000 acres, respectively, in 1939. The lower production in 1940, in spite of the record acreage, was attributed to the low acre yield due to hot dry weather early in July and in August, especially in the important soybean States of Illinois, Indiana, and Ohio. Average acre yields were 16.1 bu. in 1940 and 20.7 bu. in 1939. States leading in yields of soybeans for beans were: Illinois 35,140,000 bu., Iowa 15,026,000, Indiana 10,989,000, Ohio 8,400,000, North Carolina 2,282,000, and Michigan and Missouri each with 1,176,000 bu. The season average price per bu. (preliminary) received by farmers was 75.8 cents in 1940 and the value of production was estimated at \$60,535,000 versus 81.4 cents and \$74,299,000 in 1939. Soybean hay production declined to 6,312,000 tons from 4,883,000 acres in 1940 from 6,565,000 tons from 4,612,000 acres in 1939. The area of soybeans grazed or plowed under in 1940 totaled 1,618,000 acres.

The 1940 crop of soybeans in Manchuria was officially estimated at 140,984,000 bu. (144,952,000 bu. in 1939).

**SPAIN.** A State of southwestern Europe. Capital, Madrid.

**Area and Population.** Area, 196,607 square miles, including the Balearic Islands (1935 sq. mi.) and the Canary Islands (1279 sq. mi.). The population in 1940 was estimated at 26,000,000 (23,564,000 at 1930 census), including the Balearic Islands (estimated pop., 381,594 in 1939) and the Canaries (286,154 in 1939). Living births in 1938 numbered about 453,584 (17.8 per 1000); deaths, 417,919 (16.4). Populations of the chief cities were (1934 estimates except as stated): Barcelona, 1,399,000 (1940); Madrid, 1,194,000 (1940); Valencia, 352,802; Seville, 238,727; Málaga, 203,844; Saragossa, 189,062; Bilbao, 175,898.

**Colonial Empire.** The principal divisions of the colonial possessions of Spain are listed in the

Colony (Capital)	Sq. mi.*	Population*
Spanish Guinea <sup>a</sup> (Santa Isabel)	10,124	120,000
Spanish Morocco <sup>a</sup> (Tetuán)	8,108	750,000
Western Sahara <sup>a</sup> (Villa Cisneros)	110,036	110,038
Total.....	128,570	890,000

\* Estimated. <sup>a</sup> Includes Rio Muni (on the mainland) and the islands of Fernando Po, Annobon, Corisco, Great Elobey, and Little Elobey. <sup>b</sup> Excluding Tangier which was occupied by Spanish troops on June 14, 1940, and incorporated with Spanish Morocco on Nov. 14, 1940. See TANGIER under *History*. <sup>c</sup> Includes Rio de Oro, Adrar, and Ifni.

accompanying table. For administrative purposes the Balearic Islands in the Mediterranean, the Canary Islands off the northwest coast of Africa, and the areas of Ceuta and Melilla in north Africa, are considered an integral part of Spain.

**Education and Religion.** The 1930 census showed 45 per cent of the adult population as unable to read or write. Under the Franco regime, the Roman Catholic Church was re-established as the official religion. The religious orders recovered their pre-republican legal status, properties, State subsidies, teaching rights, jurisdiction over cemeteries, and other privileges (see *History*). In 1935 there were 4,720,260 pupils in 42,766 elementary schools; 130,752 pupils in 111 secondary schools, and 31,905 students in 11 universities.

**Production.** Agriculture, mining, manufacturing, and fishing are the chief occupations. Spanish economy was badly disrupted by the civil war of 1936-39 and the European War (see *History*). The principal products in 1939 were (in metric tons), with 1940 estimates in parentheses. Wheat, 2,877,900 (3,300,000); barley, 1,408,300 (2,000,000); rye, 410,300 (700,000); oats, 478,600; corn, 843,300; rice, 178,100 (225,152,000 bu. in 1940-41); potatoes, 4,781,700 (average for 1930-34); beet sugar, 111,000 in 1939-40; wine, 17,200,000 hectoliters in 1937 (hectoliter equals 26.42 U.S. gal.); olive oil, 370,000 in 1939-40; wool and mohair, 27,200 in 1938; rayon and staple fiber, 1399; lignite, 204,000; coal, 6,753,000; pyrites (exports), 1,636,000; iron ore, 2,184,735 (average for 1933-39); pig iron and ferro-alloys, 500,000; steel ingots and castings, 600,000; copper ore, 820,000 tons (exports of Rio Tinto mines only); lead (smelter), 27,000; zinc (smelter), 11,300; quicksilver, 1450 (imports from Spain into principal importing countries). The chief manufactures are cotton textiles, paper, glass, etc. The 1940-41 orange crop was estimated at 24,443,000 boxes of 70 lb. each. Many other fruits, cork, and fishery products normally are exported.

**Foreign Trade.** Publication of Spanish trade statistics was suspended early in 1936 and not resumed until 1940, when data covering the last nine months of 1939 were made available. Converted into U.S. dollars, imports for April-December, 1939, were \$111,978,000 (\$287,256,000 for calendar year 1935); exports, \$78,287,000 (\$192,173,000, including gold and silver). Foodstuffs accounted for 42 per cent of the 1939 imports as against 14 per cent of the 1935 total. The relative proportion of all other major classes of imports showed a marked decline in 1939 as compared with 1935. The principal 1939 exports were (nine months): Foodstuffs, \$46,217,000; minerals, \$10,929,000; chemical products, \$6,794,000; wood and vegetable matter and their manufactures, \$5,027,000. Argentina supplied 27.9 per cent of the 1939 nine months' imports (2.5 in 1935); United States, 14 (16.8); Germany, 12.9 (13.7); United Kingdom, 5.1 (10.4); France, 1.7 (5.5). Of the 1939 exports, the United Kingdom took 25.4 per cent (21.7 in 1935); Germany, 24.8 (12.7); United States, 10.1 (9.5); Italy, 6.2.

**Finance.** According to a statement of the Minister of Finance on Aug. 6, 1940, the Franco Government's receipts during the civil war of 1936-39 were 3,684,000,000 pesetas and expenditures 11,944,000,000 pesetas. The deficit was largely covered by advances of 7,600,000,000 pesetas from the Bank of Spain. During the nine postwar months of 1939, receipts were 2,498,000,000 and expenditures 5,118,000,000 pesetas. In September, 1939, the Bank of Spain made another advance of 2,500,000,000 pesetas to the government.

Appropriations for the ordinary 1940 budget amounted to 5,960,245,000 pesetas (about one-fourth higher than the pre-civil-war budget). In addition, extraordinary expenditures of 1,200,977,000 pesetas were authorized for repairing civil war damages, defense, etc. Revenue for part of the ordinary and all of the extraordinary budget was obtained by borrowing. Subscriptions to 3-per cent five-year Treasury notes, opened July 8, 1940, totaled over 4,000,000,000 pesetas. The 1940 budget was extended through 1941 by a decree of Dec. 30, 1940. The foreign debt in August, 1940, was estimated at 1,250,000,000 gold pesetas. The average exchange rate of the peseta was \$0.1063 for the last nine months of 1939 and \$0.0932 for 1940.

**Transportation.** Spain in 1940 had about 10,340 miles of railway lines, 70,760 miles of roads, and air lines connecting Madrid and the other chief Spanish cities with Berlin, Rome, the Canary and Balearic Islands, with London and New York via Lisbon, Portugal, and with Tetuan and Melilla in Spanish Morocco. An 85,000,000-peseta appropriation for road construction was made on June 21, 1940. Railway communication with Italy and Germany across France was re-established as of Aug. 10, 1940.

**Government.** Following a victory of the Leftist parties in the Cortes elections of Feb. 16, 1936, a military revolt broke out July 17, 1936, which forced the capitulation of the Republican Government on Apr. 1, 1939. The republic established in 1931 was replaced by a Fascist dictatorship under Gen. Francisco Franco, leader of the revolt, as Leader (Caudillo) of the Empire, Chief of State, Commander-in-Chief of the Army, Premier, and head of the Falange Española (government party), in which were merged all political groups supporting the revolt and the army. All other political parties were outlawed. Under a series of decrees issued in 1937, 1938, and 1939 (see those *YEAR BOOKS*), General Franco exercised his dictatorial powers directly (he assumed power in 1939 to issue decrees without consulting his cabinet), through a cabinet, and through the governing organs of the Falange Española.

The cabinet was composed as follows at the end of 1940: Premier and Minister of Interior, General Franco; Foreign Affairs, Ramón Serrano Suñer; Acting Minister of Interior, José Lorente Sanz; Air, Gen. Vigón Suerodiaz; Navy, Vice-Adm. Salvador Moreno; Army, Gen. José Varela; Justice, Esteban Bilbao Eguia; Finance, José Larraz Lopez; Commerce, Demetrio Carceller Segura; Education, José Ibañez Martín; Public Works, Alfonso Peña Boeuf; Agriculture and Labor, Joaquín Benjumea Burín; Minister without Portfolio, Pedro Gamero del Castillo.

The organs of the Falange Española consist of a National Council of about 100 members, representing the various Nationalist political interests, and a Political Council of 19, composed of delegates to the National Council and serving as the permanent governing body of the party. Franco is president of the National Council and appoints its Secretary-General. It is empowered to determine the structure of both State and government party, control syndical organizations, etc. The president of the Political Council of the party is Ramón Serrano Suñer, Franco's brother-in-law, and the guiding spirit of the Falange Española.

## HISTORY

**Internal Developments.** Conditions within Spain went from bad to worse during 1940. Re-

construction after the civil war had barely started when the outbreak of the European War on Sept. 1, 1939, interrupted plans for pushing rehabilitation with German technical and economic aid. The collapse of France in June, 1940, enabled Spain to reopen overland communications with Germany and Italy. But the resultant economic exchange was more than offset by the extension of the British blockade to Spain at the end of July. The crops harvested in 1940 were considerably better than in 1939, but remained insufficient to feed the population, particularly in view of the continued dislocation of surface transportation systems. Moreover the continuance of the bitter internal dissensions that had produced the civil war, and the development of new tensions within the government itself, placed added difficulties in the way of national reconstruction. The government's lively preoccupation with military preparations and ambitions had a similar effect.

The net result was a general tightening of the hunger and privation that had afflicted the Spanish people since the outbreak of the civil war in 1936. By the end of 1940, large sections of the population were reported to be severely undernourished or facing starvation. Effective December 1 the bread ration for the rich and well-to-do was reduced to increase the quantity available for the poor. The government ordered the cultivation in 1941 of all lands that had been under the plow since 1900. Only the relaxation of the British blockade to permit imports of corn, obtained on credit from Argentina, and of Red Cross food supplies from the United States prevented actual famine in certain districts. The Civil Governor of Madrid on December 20 declared that "the hunger and misery of Spain grieves us to the heart," but could offer little hope for an improvement of conditions. This was because the Spanish Government was unwilling to give the political assurances and make the adjustments of foreign policy that would have opened the way for large-scale importations of food and other essential supplies from the United States, Latin America, and the British Empire countries.

**Political Trends.** The restriction of overseas imports into Spain by the British blockade was introduced after the Madrid Government showed every intention of throwing in its lot with the Axis powers in the hope of consolidating the Fascist system in Spain and securing territorial compensation at the expense of Britain and France. The British used the blockade as an effective weapon for cutting off transshipments of war materials to Germany through Spain and also for keeping Spain neutral by restricting imports to bare subsistence requirements. See GREAT BRITAIN under *History* for further details.

Britain's fear that General Franco would either join in the conflict, or permit German troops to cross Spain to attack Gibraltar, was deepened not only by Franco's foreign policies (see below) but also by the strengthening of the power of the pro-Axis Fascist section of the Falange Española as against the other elements in the government party—monarchists, some army officers, and clericals—who in general favored a policy of neutrality.

The pro-Axis trend was reflected in the replacement of the outspoken Air Minister, Gen. Juan Yagüe, on June 28 by Gen. Juan Vignón Suerodiaz. General Franco on October 17 ousted Col. Juan Beigbeder y Atienza, another pro-neutral army leader, from the key post of Foreign Minister. He appointed to the vacancy his brother-in-law, Ser-

rano Suñer, Minister of Interior and the strongly pro-Axis leader of the Spanish Fascist movement. Serrano Suñer declared that his appointment meant Spain's acceptance of the "new order" in Europe. Franco himself took over Serrano Suñer's former post of Minister of the Interior.

Earlier in the year the political pendulum appeared to be swinging away from the Fascists and their program. In opposition to the Fascists, the government on March 6 decreed the return to the grandees of the lands expropriated by the republic for distribution among the peasants. On January 27 the extensive properties and lands of the Jesuits, confiscated by the republican government in 1932, were restored by decree. This appeared to open the way for a settlement of the controversy over the appointment of Spanish bishops that had deadlocked negotiations for a concordat between the Vatican and the Franco Government late in 1939 (see YEAR BOOK, 1939, p. 719). Nevertheless the deadlock continued through 1940. The Vatican organ *Osservatore Romano* on October 5 issued an unprecedented rebuke to Serrano Suñer, who as special envoy of Franco had visited Rome for consultations with Italian officials without making the customary request for a pontifical audience. The wealthy were likewise antagonized by further heavy increases in taxes, decreed December 22, and by General Franco's order of July 17 increasing wages of day laborers by one-sixth.

**Treatment of Opposition.** Another sign of extremist domination of the government was the continued harsh repression of the elements that had fought to defend the republic. Vatican sources reported on January 25 that Spanish prisons and concentration camps still held 500,000 political prisoners, including a number of priests, and that 25 persons had been executed the preceding month.

The government on March 2 promulgated a law aimed primarily at Masonry. It provided for the dissolution of all secret orders, the confiscation of their properties, and imprisonment for six years of persons engaging in propaganda on their behalf. The police on June 19 announced the breaking up of "a vast and clandestine organization" supported by Spanish Communists living abroad. The execution of Luis Companys, former head of the autonomous government established in Catalonia under the republic, was announced October 16. Six days later five other prominent members of the former Republican Government were sentenced to death, despite appeals for clemency from some of the Spanish-American republics. These men were among about 90 prominent Catalan and Republican leaders who had taken refuge in France and were turned over to the Franco Government by the Pétain regime.

Seeking to check the rising tide of popular discontent, the government toward the end of the year arrested several hundred merchants and manufacturers charged with profiteering or hoarding and sent them to labor camps. Steps were also taken to tighten restrictions upon the press and other forms of communication.

**Expansionist Aims.** The serious internal situation served as an effective brake upon Spain's entrance into the European War on the side of the Axis so long as Britain appeared able to continue the struggle. But it did not curb the expansionist aims of the Franco Government nor prevent it from making all preparations for taking the greatest possible advantage of a British defeat.

The government continued to spend large sums upon its fighting forces. The Civil Guard, Spain's

famous rural police force, was placed under army control on March 17. On August 20 the compulsory military service term was increased to two years instead of one. War Minister Varela visited the strategically situated Canary Islands at the end of October and on December 29 General Franco authorized the "urgent" expropriation of lands at Las Palmas in the Canaries for the construction of a large military base. By a decree of December 6, all boys and youths between 7 and 22 years of age were organized in a Youth Front for political and pre-military training.

The extent of Nationalist ambitions was revealed during the French military debacle in June, when it seemed probable that Britain too would soon surrender. On May 13, a Foreign Office communiqué had reaffirmed Spain's policy of neutrality, proclaimed in 1939. A month later (June 13), following Italy's entrance into the war, General Franco substituted a policy of "non-belligerency" for that of neutrality. According to the newspaper *Arriba*, organ of the Falange Española, "non-belligerency" implied all aid to the Axis powers short of actual entrance into the war. On June 14 Spanish troops occupied Tangier (q.v.) in defiance of the Allied powers signatory to the treaty internationalizing that territory, and on November 14 it was incorporated into Spanish Morocco. There were reports that Spain was fortifying the Tangier Zone, with the aid of German engineers, and installing long-range guns capable of covering the Strait and bombarding the Rock of Gibraltar on the opposite side.

In mid-June, coincident with the announcement that Germany and Italy had invited Spain to participate in drafting the peace terms to be offered France, the Nationalist press called for the cession to Spain of Gibraltar, part of French Morocco, and the principality of Andorra in the Pyrenees.

Much emphasis was placed upon the opportunity that an Axis victory would present for the extension of Spanish influence in Latin America. General Franco on November 7 established a Council of Hispanicism to strengthen Spain's relations with Spanish America and the Philippines. Foreign Minister Serrano Suñer aroused some alarm and much criticism in Latin America by comparing the new Council to the Council of the Indies, through which Spain once ruled the American colonies. *Arriba* on October 13 proclaimed Spain's determination to defend the rights of the Latin American nations, protect the Spanish spirit there, and extend the "new order" being established in Europe to Latin America.

With this objective in view, the Spanish Government and press, acting in conjunction with Falangist branches in the Latin American countries, fought to curb the influence of the United States in Hispanic America and to disrupt the Pan American movement (see PAN AMERICANISM). The negotiations between Uruguay and the United States for the construction of inter-American defense bases in Uruguay with American aid provoked a furore of denunciation in Spain. However Spain's assumption of a "big brother" role toward the Spanish American nations was not attended with great success. See ARGENTINA, CHILE, COLOMBIA, CUBA, ECUADOR, MEXICO, and URUGUAY, under *History*.

**Negotiations with the Axis.** When German troops extended their occupation of France to the Spanish frontier on June 28-29, they received a cordial welcome and promises of material and

moral support from Spanish army officers and officials. During the summer and autumn, while the fate of Britain hung in the balance, the Spanish press prepared the country for entrance into the conflict on the side of the Axis and a joint Spanish-German attack upon Gibraltar. On July 17 General Franco told a gathering of officers that "there remains for us as a duty and a national mission control of Gibraltar, expansion in Africa and continuance in the policy of unity." There were accompanying demonstrations in Madrid and other cities demanding the return of Gibraltar.

While refusing German and Italian pressure for an immediate declaration of war, General Franco in September sent Serrano Suñer to Berlin and Rome to lay the foundations for closer Spanish collaboration with the Axis and to obtain specific pledges concerning the territorial compensation to be obtained in return. This involved an adjustment of conflicting Italian and Spanish claims in French Morocco, reported to have been effected through the influence of Hitler. The Rome press on October 1, during Serrano Suñer's visit, stated that Spain's role in the Axis was fixed, but that she would bide her time to "strike for her rights."

As British resistance stiffened and Axis difficulties grew, both Italy and Germany increased pressure upon General Franco for more active aid. In this they were supported by the Spanish Fascists. On October 23 Chancellor Hitler conferred with Franco at the Spanish border and reportedly sought to persuade him to allow German troops to cross Spanish territory to attack Gibraltar, without calling on Spain's military assistance. Franco was said to have replied that the crucial food shortage did not permit of even this limited co-operation with the Reich. However Spanish-German relations became increasingly close. The opening of a rail link across France permitted the shipment of considerable quantities of Spanish iron ore and other minerals, almonds, fruits, etc., to Germany in return for some manufactured articles. On November 18 Serrano Suñer returned to Berlin for further conferences with Hitler, during which territorial annexations were again discussed. Subsequently the Spanish press began to bring pressure upon the Vichy Government for territorial concessions in Morocco.

**Hostility to United States.** Spanish press attacks upon United States policies, particularly Washington's aid to Britain and support of inter-American co-operation, became extremely violent during November while the Uruguayan base issue was under discussion. However a hostile demonstration before the U.S. Embassy in Madrid by university students brought an apology from the Franco Government on November 22, and a curb on the anti-American press campaign. The primary reason for this change was the refusal of the State Department at Washington to proceed with negotiations for food shipments to Spain until the Franco Government adopted a more friendly attitude toward both Britain and the United States. Towards the end of the year Washington, with Britain's consent, agreed to permit the American Red Cross to send a few million dollars' worth of food and medical supplies to Spain. More substantial aid to Spain in the form of credits for the purchase of foodstuffs, cotton, etc., was prevented by Franco's adherence to his pro-Axis policies. The United States also objected to Spain's military occupation of Tangier (q.v.).

For the Spanish-Portuguese mutual assistance pact of July 30, see PORTUGAL under *History*. Also

see BELGIUM, FRANCE, GERMANY, GREAT BRITAIN, ITALY, and MOROCCO, under *History*; FASCISM; INDUSTRIAL CHEMISTRY; LABOR CONDITIONS.

#### SPANISH-AMERICAN LITERATURES.

World conditions have made it very difficult to assemble materials for such articles as these. Consequently this presentation of the year's activities must not be taken as exhaustive, nor must the omission of any country be held as evidence that it was non-productive in 1940.

The following works are of general interest: John Tate Lanning, *Academic Culture in the Spanish Colonies*; Dwight Carroll Miner, *The Fight for the Panama Route, the Story of the Spooner Act and the Hay-Herran Treaty*; Miles P. Duval, Jr., *Cádiz to Cathay: the Story of the Long Struggle for a Waterway Across the American Isthmus* (both books important and supplement each other); Duncan Aikman, *The All-American Front*; Lewis Hanke and Raúl d'Eça, *Handbook of Latin American Studies 1938*; John T. Whitaker, *Americas to the South* (objective and timely study of conditions in the Hispanic countries).

**Argentina.** Of the materials that have come to hand, the field of erudition shows the heaviest contributions, with verse in second place.

**Prizes.** The Comisión Nacional de Cultura awarded the prizes for Criticism, Philosophy, and Essays for the triennium 1937-39: the first to the important critical history *El Arte de los Argentinos*, by José León Pagano; the second to *La Ética formal y los valores*, by Carlos Astrada; and the third to *Tres Ensayos españoles*, by Ignacio B. Anzoátegui. The prizes for History for the same triennium were awarded as follows: to Ramón J. Carcano, *La guerra del Paraguay*; to Col. Juan Beverina, *Las invasiones inglesas al Río de la Plata*; and to Juan Alfonso Carrizo, *Cancionero popular de las provincias de Salta, Jujuy, y Tucumán, y cantares de Tucumán*. First prize in the poetry contest held in Buenos Aires by the journal, *Martín Fierro*, went to Juan Rodolfo Wilcock for his *Libro de Canciones y Poemas*. The Municipality of Buenos Aires' first prize in literature for 1939 was awarded to Augusto Mario Delfino for his group of short stories entitled *Fin de Siglo*.

**Drama.** Ricardo Rojas continued his triumph with successive editions of *Ollantay* (first performed with such acclaim in 1939). It should be remembered that Rojas began working on this play as early as 1909, his father, being governor of a Quechua-speaking province of Argentina. His more recent work, *Un Titán de los Andes*, sets forth his scholarly investigations concerning the transmission of the legend from earliest times down to the present. Ataliva Herrera (a poet of real distinction and grace) produced *Las vírgenes del Sol*, highly praised for his re-creation of the city of Cuzco, capital of Peru, as of November, 1532. Maestro Alfredo L. Schiuma set it to music and it was performed, and won great applause, in the Teatro Colón at Buenos Aires.

**Verses.** Julia Prilutzky Farny de Zinny produced *Viaje sin partida* (25 exquisite sonnets, a love story, by a woman graduate in law and a master analyst of the human soul), and J. Alfredo Fontao, *Lámpara de amor* (nearly fifty sincere, dainty poems all addressed to one lady).

**Erudition.** Biblioteca "La tradición Argentina" (appearing weekly) has already published 35 vols. of about 150 pages each. Other works of erudition that may be listed are: Madaline W. Nichols, *Sarmiento: a Chronicle of Inter-American Friend-*

*ship* (important contribution to inter-American studies, new information concerning this great Argentinian who did so much to give his countrymen a faithful interpretation of us); Enrique Larreta, *Tiempos iluminados* (charming book of reminiscences of outstanding moments in the life of the author from early childhood through his last diplomatic visit to Bordeaux); Aída Cometta Manzoni, *El Indio en la Poesía de América Española*; Manuel Gálvez, *Vida de Hipólito Yrigoyen, el hombre del misterio* (powerfully written); Alberto Rembao, *Mensaje, movimiento, y masa* (a spiritual book with a world vision of present day problems).

**Academia Argentina de Letras.** Early in the year, Juan P. Ramos, member-elect, was formally received, with the reading of his entrance discourse, *Juan María Gutiérrez*. At the request of the members-elect, the *Academia* at its meeting April 25, voted to receive formally this year only two of them, Juan Alvarez and José León Pagano, and leave the other two (Ramón J. Carcano and Enrique Banchs) for initiation in 1941.

**Necrology.** Argentina suffered several severe losses from among her men-of-letters, her statesmen, and her teachers and scholars.

Gullot, Víctor Juan. Novelist, dramatist, historian, orator, journalist, educator, statesman (elected four times as Deputy to the Chamber), and outstanding parliamentarian, died in August. Among his principal writings are: *Historias sin importancia* (second Municipal Prize, 1921); *El alma en el pozo* (first Municipal Prize, 1925); *Terror* (short stories, 1938); *La aventura del hombre* (seven plays, 1938); *Paralelo 55* (travel stories from his exile in the south); *Heróismo civil*, and an historical work, *Cabildos Coloniales*.

Onetti, Carlos María. Influential professor and investigator of Argentine and American literatures and folklore in the Instituto Nacional del Profesorado in Paraná, died July 25. His last work, *Cuatro clases sobre Sarmiento, escritor*, was published by the University of Tucumán and is considered very important. As a poet he is known for three inspired works: *El desfile amoroso*, *El barco de vela*, and *Provincianista con estrellas federales*.

García, Ginés. Brilliant poet, died July 18, at the age of twenty-five. His first book, *Las Ausencias*, appeared in 1935, when he was twenty. It was prologued by Roberto Giusti, Director of *Nosotros*, who went especially to San Nicolás, where the burial took place, and made an address setting forth his judgment of the poet's merits.

**Bolivia.** The materials that have reached us from Bolivia are chiefly erudition.

**Fiction.** Roberto Leiton, *Los Eternos Vagabundos* (sympathetic study of the tragedy of the Bolivian tin mines; many striking pictures of nature and the natives).

**Erudition.** Gustavo Adolfo Otero edits *Tihuanacu (Antología de los principales escritos de los cronistas coloniales americanistas e historiadores bolivianos)*, an enlightening sketch of 3000 years of pre-Colombian Tihuanacu culture and its spread from Easter Island, west of Chile, to the Río Negro in Amazonas. Abelardo Villalando Retamozo, *La Cuestión del Indio*, a keen study, with a purview of Bolivian history from ancient times to the present. Aquiles Vergara Vicuña, *El Mar, nexo de pas entre Bolivia y Chile*, a strong, documented plea for the return of the port of Arica to Bolivia.

**Chile.** Chile this past year was long on erudition as compared with other forms of literature, fiction taking second place.

**Erudition.** Luis Alberto Sánchez, *Garcilaso Inca de la Vega* (valuable, fascinating accounts, accompanied by a glossary of Quechua phrases); Domingo Amunátegui Solar, *Estudios Históricos* (interesting series of essays); Roberto Meza Fuentes, *De Días Mirón a Rubén Darío* (course at the University of Chile on the evolution of Hispanic-American poetry); Guillermo Rojas Car-

rasco, *Filología Chilena: Guía bibliográfica y crítica* (first prize of the Academia Chilena de la Lengua); Víctor M. Vergara, *La Isla de Pascua—Dominación y Dominio* (publicaciones de la Academia Chilena de la Historia), authoritative book concerning the history and complications of the ownership of Easter Island; Antonio Roco del Campo, *Panorama y Color de Chile* (to be recommended to foreigners who wish to get a background for understanding Chileans and their culture; Julio Vicuña Cifuentes, *Prosas de Otros Días*, a posthumous work collected (from many sources of original appearance) and published by the son, Julio Vicuña Luco.

**Fiction.** Luis Durand, *Mi Amigo Piden y Otros Relatos* (ten excellent short stories about country life in southern Chile); Sady Zanartu, *Chilecito* (23 short stories dealing with Chilean life, history, outlook on life, and social conditions of today); Juan Marín, *Orestes y yo* (psychological novel written by a doctor concerning a doctor and his wife and son, all three of them abnormal); Hugo Blym, *Puno* (a careful study of another phase of the Indigenist problem).

**Prizes.** The 1938 Chilean Writers' Society Prize went to Rubén Azócar for his novel, *Gente en la Isla*. The Faculty of Philosophy and Education in the University of Chile offered a reward for the best study of Alberto Blest Gana. Owing to the excellence of the best two studies the committee decided to split the prize between them, awarding one half to each author. The one by Hernán Díaz Arrieta (pen-name "Alone") appeared as *Don Alberto Blest Gana: Biografía y Crítica* (the best study thus far about Blest Gana or any Chilean author).

**Necrology.** The Academia Chilena de la Lengua lost heavily through death during the year.

**Silva Villdósola, Carlos.** Born in Cheihuaihue (Angol), studied in the Lyceo de Chillán, the Instituto Nacional, the Colegio de San Ignacio, and the Universidad Católica. Thereafter he devoted himself to journalism and was secretary of the Chilean Legation at London (1900-02). He belonged to the Société des Gens de Lettres, Paris, and held the decorations of the Legion of Honor, Commander of the Order of the British Empire, Knight of the Order of San Mauricio y San Lázaro, and officer of the Order of Leopold of Belgium. Possessed of an easy and picturesque style, he gave us two novels: *La Montaña and Brisas de mar*, a travel book, *En la nieve* (Santiago, 1913), a study, *Periodismo y letras en Chile* (1914), *Del dolor y de la muerte la guerra vista por un chileno* (1916), and *Le Chui et la Guerre*. Despite his brilliant qualities that would have permitted him to play an outstanding role in any congress, politics never tempted him. He died Dec. 22, 1939, at the age of 70.

**Barriga, Juan Agustín.** Writer and lawyer, born in Santiago, 1853, pursued his studies in the Instituto Nacional and in the University of Chile, early collaborated on the newspaper, *La Estrella de Chile*, becoming later one of the founders of the review, *Arte y Letras* (1884). He was also professor of the University of Chile and of the Catholic University, and served as deputy of the conservative party. Because of the political incidents of 1891, he was exiled and resided for a while in Montevideo and Buenos Aires. He was the oldest member of the Academia Chilena (Correspondiente de la Academia Española) since the Real Academia Española elected him directly Correspondiente in 1895, during a period when the Academia Chilena was inactive. He was also Correspondiente of the Real Academia Sevillana de Buenas Letras. Among his published works are *De la lengua castellana como instrumento de arte literario*; *Don Marcelino Menéndez y Pelayo*; and *Discursos y notas críticas*.

**Echenique Gandarillas, José Miguel.** Elected to membership in the Academia Chilena, he took possession of his chair, Nov. 18, 1937, but his membership in the Academy was of such short duration that his entrance discourse could not be published until the numbers 25 and 26 of Tome VII, published in 1940 and bearing the news of his death.

**Poblete Escudero, Egidio.** Man-of-letters and journalist, born in Los Andes, Nov. 25, 1860. After completing the Humanities course in the Seminary of Santiago, and serving in several administrative capacities, he became

professor in the Naval School, 1901-05. Thereafter he devoted himself almost wholly to journalism and figured on the editorial staff of *La Unión* of Valparaíso; of *El País*, of Concepción, of which he was also Director; and of *El Mercurio*, having made popular during this period the pseudonym of "Ronquillo." In 1928 he was made Secretary-General of the Central Chamber of Commerce. As Director and President of the Círculo de la Prensa of Valparaíso, he organized the Federación Nacional de Periodistas and the holding of the Congreso de la Prensa. He published poems, short stories, novels, and dramas. Among his other publications may be mentioned: *Humoradas* (collection of his articles); *Tratado del Derecho industrial*; *Cuentos de Ronquillo*; a translation of Virgil's *Aeneid* into harmonious Castilian verse; a very fine novel, *La Aventura de las Acacias*, and his drama, *La Mujer de César*. His verse translation of the *Aeneid* was so highly approved by Chileans and others that the Chilean Academy of the Language, of which he was a member, proposed him for the Nobel Prize, an act which will suffice to prove what his fellow academicians thought of him.

**Colombia. Erudition.** Max Grillo, *El Hombre de las Leyes* (estudio del General Francisco de Paula Santander en la Guerra de la Independencia); Ignacio E. Copete, *La Fiducia* (tesis de grado para obtener el título de Doctor en Derecho y Ciencias Políticas); Daniel Ortega Ricaurte, *La Hoya del Amazonas*, (obra laureada con el primer premio de la Sociedad Geográfica de Colombia y de la Universidad Nacional en el concurso de 1938); José Manuel Pérez Sarmiento, *Causas Célebres a los Precursores*, Tomo I; Nicolás García Samudio, *Crónica del muy Magnífico Capitán, Don Gonzalo Suárez Rendón*, publication of the Colombian Academy of History as a homage to the city of Tunja on the fourth centenary of its founding; Luis Augusto Cuervo, *Bailes de Antaño*, a bit of history of the social life of the country in connection with its social and native dances; Manuel José Forero, *Santander, Prócer de la Independencia Nacional*; B. Matos-Urtado, *Perfiles de Santander y un Diario inédito de su enfermedad y muerte (1840-1940)*; 1840 *Muerte de Santander* (Publicación Colombiana de Historia), highly illustrated and documented volume.

**Verse.** A. Ortiz-Vargas, *Las Torres de Manhattan*, a very attractive, sympathetic picture and analysis of what New York stands for in matters of culture, in the form of an epic poem; German Pardo García, *Selección de sus Poemas*, and *Presencia* which some critics claim is the finest expression of Colombian verse.

**Necrology.** The following death occurred during December of 1939:

**Goenaga, Florentino.** Man-of-letters and government official; born in Riohacha in 1859; died in Santa Marta, Colombia, Dec. 14, 1939. Studied in the Colegio del Espíritu Santo where he obtained the degree of Doctor of Jurisprudence and Professor of Political Science. As soon as he finished his career, he was called by the members of the Junta de Delegados Conservadores. He went to Spain in 1884 and remained there a year as an agrégé of the Colombian Legation. Back in his own country he served from 1886 to 1888 as fiscal of the Tribunal of Cundinamarca and was elected magistrate of the Tribunal of Magdalena. In 1890 he figured as deputy for Riohacha and Valledupar and in the congresses of 1892 and 1894 as Senator. In 1891 he was Rector of the University of Bolívar and 1893, the Prefect of Riohacha.

**Cuba. Erudition.** Gerardo Castellanos G., *Pensando en Agramonte: Habana—Camagüey*, scholarly work dealing with one of Cuba's most important historical personages; Carlos Enriquez, *Tilín García* (a novel of the *Guajiro* similar to *La tragedia del Guajiro*, by Ciro Espinosa, mentioned in the 1939 YEAR BOOK; Alberto Arredondo, *El Negro en Cuba*, a real study to evaluate the Cuban Negro as an integral part of the Island nationality; Francisco González del Valle, *Heredía en la Habana*, part of a series of "cuadernos de la historia habanera"; Alfonso E. Paez, *Recordando a*

*Heredia*, a series in one volume of illuminating critical essays on Heredia; Cosme de la Torre, *Cuarenta Años de mi Vida, 1898-1938* (the author had a share in the military rebellion which finally overthrew the Spanish dominion and in the restoration work which brought about the establishment of the republic).

**Fiction.** Enrique Serpa, *Días de Trinidad*, an important little volume first appearing as a series of newspaper articles in *El País*, now reappearing in book form as a direct result of a genuine demand on the part of several internationally-known Cuban men-of-letters; Lydia Cabrera, *Cuentos Negros de Cuba*, an important volume of 22 folk tales collected by the author—the first Cuban woman in the field of Afro-Cuban folklore—with a prologue by Fernando Ortiz, the Vice-Director of the Academia Cubana himself an authority on Afro-Cuban affairs.

**Dominican Republic. Erudition.** Pedro Henríquez Ureña, *Plenitud de España (Estudios de Historia de la Cultura)*, and *El Español en Santo Domingo*; Charles Callan Tansil, *The U.S. and Santo Domingo, 1798-1873*, important account of diplomatic history based on wide research in archives of France, Germany, Great Britain, and U.S.; Florida de Nolasco, *De Música española*, an attractive second work completing her first work on music; Manuel A. Peña Battle, *Las Devastaciones de 1605 i 1606 (contribución al estudio de la realidad dominicana)*, published by the Comisión de Publicaciones as a valuable addition to Dominican history; Manuel Rodríguez Obispo, *Gregorio Luperón e Historia de la Restauración*, important historical document published by the government to commemorate the first centenary of the death of the author; Leonardo Henríquez (son of the celebrated Dominican diplomat and historian, Max Henríquez Ureña), *Cartilla Diplomática*, a useful handbook for beginning diplomats; Pablo Peralta, *El Evangelio del Gaucho Juan Claridá*, the gaucho evangel of Juan Claridá constitutes a civic and lay moral for every day.

**Verso.** Enrique Henríquez, *Nocturnos i otros poemas*, a volume of unusually beautiful poems representing different ages and experiences of life; Carmen Natalia, *Alma Adentro*, a volume of exquisite poems that invite one to enter the very sanctuary of her dreaming soul; Américo Lugo, *Heliotropo*, the first edition, published in 1908, was highly praised by Manuel Arturo Machado. In this new edition the poet has given some additional material and the critics claim that beautiful as was the original, these new parts are still more beautiful.

**Ecuador. Erudition.** Pío Jaranillo Alvarado, *La Presidente de Quito*, Vol. II (memoria histórica-jurídica de los orígenes de la nacionalidad ecuatoriana y de su defensa territorial), these two volumes together with his earlier *El Indio Ecuatoriano* are of fundamental importance to a real knowledge of Ecuador; José Gabriel Navarro, *Contribuciones a la Historia del Arte en el Ecuador*, Vol. II, a second volume, handsomely illustrated, of this monumental history; Augusto Arias, *Páginas de Quito*, an exceedingly beautiful book describing the very inmost soul of Quito.

**Fiction.** Eduardo Moro Moreno, *Humo en las Eras*, a collection of five short stories, with a short introduction by Carlos M. Espinosa, portrays the condition of the Indian before the coming of the Whites.

**Necrology.** Included below is the death of Remigio Crespo Toral who died during July of 1939,

**Jiménez Mena, Nicolás.** Ecuadorian public official; born in Quito, Sept. 8, 1883; died in Guayaquil, May 2, 1940. Graduate, Faculty of Jurisprudence, University of Quito; chief of Archives, Ministry of Foreign Affairs; Under-Secretary, Ministry of Government; Secretary, Bureau of Telegraphs; Under-Secretary, Ministry of Public Works; member, Sociedad Jurídico-Literaria of Quito, Academia Nacional de Historia del Ecuador, Correspondent, Academia Nacional de Historia de Venezuela; Knight Commander of the Orden de Mérito del Ecuador; received national homage for his literary and journalistic accomplishments in 1937; author of several works, biographical, critical, literary, legal, and educational.

**Toral, Remigio Crespo.** Ecuadorian litterateur and statesman; born in Cuenca in 1860; died July 8, 1939, in Cuenca. While still a student, he was elected deputy to the Convention, soon gained reputation as notable orator. Re-elected five times he became Vice-President of the Chamber of Deputies in 1887 and President in 1888. He was a man of wide culture having traveled much throughout South America, the United States, and Europe; was a member of the Academia Ecuatoriana; inspired poet and keen critic; justly considered one of the great lights of Ecuador. Among his writings are *Últimos Pensamientos de Bolívar*, a poem awarded a prize by the University of Quito (1884); *América y España*, awarded a prize by the Academia Ecuatoriana in 1888, and *My Poema*.

**Guatemala. Fiction.** Elisa Hall, *Mostaza*, a sequel to her *Semilla de mostaza*, is to be followed by a third volume, *Mostaza en flor*. The two books already out, picturing Guatemalan national history with the broader appeal of Spanish colonial life in general, are very important as fiction, and as history; J. Fernando Juárez Muñoz, *El Secreto de una Celda*, a delightful historical novel by the Secretary of the Sociedad de Geografía e Historia de Guatemala, the plot of which is developed during 1716-17, and includes the earthquake of San Miguel.

**Erudition.** J. Antonio Villacorta C., *Historia de la Capitanía General de Guatemala*, hailed as the most complete history of colonial times that has appeared on the continent; José María Bonilla Ruano, *Mosdico de Voces y Locuciones Viciosas*; Máximo Soto Hall, *Los Mayas*, a careful study of the various aspects of the Mayan Indians and their culture; Chester Lloyd Jones, *Guatemala Past and Present*: the author made his first trip to South America on an educational mission in 1914, as a member of a group of educators sent by the American Association for International Conciliation. From that time until this, having been a constant student of inter-American questions he has been able to produce, concerning Central America and Guatemala, what is considered to be the most comprehensive study which has thus far appeared in English.

**Honduras. Erudition.** Nestor Bermudes, *Escritor de Honduras (perfiles fugaces)*, small quarto volume, 215 pages of text, brief sketches of Honduran Writers.

**Mexico.** From Mexico the past year the greatest number of works has been in erudition. Of general interest is a new scholarly journal, entitled *Revista de Literatura Mexicana*, first number July-September, 1940. It will appear quarterly. Director Antonio Castro Leal has a fine editorial board of natives and foreigners.

**Erudition.** *Veinte siglos de arte mexicano*, produced by specialists in the various branches and epochs of art, and by co-operation between the Government of Mexico and the New York Museum of Modern Art, with biographies of the artists and the corresponding bibliography, very important; Xavier Villaurrutia, *Textos y pretextos*, a poet's first book of criticism and one of the best published in Mexico in recent years; Verna Carleton Millan, *Mexico Reborn*, and Nathaniel and Sylvia Weyl, *The Reconquest of Mexico*, two very important books, complement each other, written from totally different points of view; Rafael

Heliodoro Valle, *Bibliografía de Ignacio Manuel Altamirano*, important work concerning versatile writer, number 8 of the *Bibliografías Mexicanas*; Fernando Ocaranza, *Juárez y sus amigos*, thoroughly documented study of this complicated period in Mexican life; Moisés Saenz, *México íntegro*, important study of many phases of Mexican life looking toward its unification; G. Gómez de Estavillo, *Recreación filológica (ensalada de lenguas)*, a jovial, humorous study of the peculiarities of certain languages, especially English, French, and Spanish; Genaro Fernández Mac Gregor (Member of the Mexican Academy, Correspondiente de la Española, and author of *Apunte Crítico sobre el Arte Contemporáneo; La Santificación de Sor Juana Inés de la Cruz; Carátulas; El Doctor Mora Redivivo: Selección de sus obras—Estudio Crítico; Genaro Estrada; and Novelas Triviales*) has recently published a volume of literary studies, *Mies Taráta*; Genaro Estrada, *Bibliografía de Goya*, a posthumous work, showing the enormous bibliographical notes that Estrada had accumulated and which are now published, with sincere devotion, by José Moreno Villa, but, as he himself notes in the last paragraph of his prologue, with an alphabetically arranged index; Carlos González Peña, *Historia de la literatura mexicana desde los orígenes hasta nuestros días*, second, corrected, and enlarged edition of this history, by a well known university professor and academician, first published in 1928, now considered the best balanced treatment we have of the development of Mexican literature, C. Rincón Gallardo, *Mangas y paños a la XVI edición del Diccionario de la Academia Española. Su vocabulario de equitación. Voces ignoradas Decires y refranes del charro mexicano. ¿México o Méjico?* Prologue by F. J. Santamaría; L. Fernández-Guerra y Orbe, *Don Juan Ruiz de Alarcón y Mendoza. Extracto con nuevos documentos y datos.* (ed. by A. Teja y Zabre); J. Jiménez Rueda, *Juan Ruiz de Alarcón y su tiempo*; Roscoe B. Gaither, *Expropriation in Mexico: the Facts and the Law*, sticking strictly to Mexican law, the author demonstrates the illegality of the expropriation law.

**Fiction.** Mariano Azuela, *Avanzada* Mexico is being watched by the Central American Republics and the South American Republics that are predominantly Indian, concerning the way she goes about the solution of the indigenous Indian problem. One critic expects *Avanzada* to be this year's best seller in Mexico and probably in all the rest of Spanish America. A. Izquierdo Albiñana, *Caos*, a poignant study of the delicate sensibilities of a mestizo whose inferiority complex produces "chaos" within him.

**Versé.** José Gorostiza, *Muerte sin fin*, a volume of some of the most living and crystal clear verse that has recently appeared in Mexico: the author develops musically a vision or a sensation of what life is, rather than a thought; Alfonso Reyes, *Villa de Unión (4 de julio de 1880)*, a kind of short story in three parts each treated in a different meter—hendecasyllables, hendecasyllables interspersed with heptasyllables, and romances.

**Nicaragua. Necrology.** The death of Dr. Santiago Argüello Barreto is recorded here.

**Argüello Barreto, Dr. Santiago.** A celebrated Nicaraguan juriconsult, poet, educator, diplomat, and man-of-letters; died July 4, 1940. Born in León, Nov. 2, 1874, he completed his legal studies at the age of twenty-two. Having served as local judge, district judge, president of the Court of Appeals of the West, Vice-Dean of the Faculty of Law, and President of the National Congress, he became in 1896, upon the organization of the Provisional Government, Minister of Foreign Affairs when only

twenty-four. Among his other works we may mention: *De tierra cálida* (verse); *Viaje al país de la decadencia* (prose); *Lecciones de literatura española*; *Ocaso* (drama); and *Ojo y alma* (verse).

**Panamá. Erudition.** Octavio Méndez Pereira, *Tierra firme*, an attractive book about Panama down to its capture in 1671 by the English pirate Henry Morgan, and Samuel Lewis, *Retazos*.

**Necrology.** The following deaths occurred during 1940.

**Miró, Ricardo.** Panamanian writer; born Nov. 5, 1883, died Mar. 2, 1940. Self-educated, he achieved high honors. Consul at Barcelona, chief of the National Archives, permanent secretary of the Academia Panameña; Officer of the Order of the Sun of Peru; founded (1907) the literary review *Nuevos Ríos*, which ran for many years; published *Flor de María* (1921). Among his other works the following are outstanding. *Preludios* (1908), *Los segundos preludios* (1916), *La leyenda del Pacífico* (1919, 1924).

**Andréu, Guillermo.** Panamanian journalist, diplomat, publicist, and litterateur; born Aug. 8, 1879; died in Hollywood, Calif., Oct. 2, 1940. Colonel, Panamanian army; member, Municipal Council; Secretary, Legation in Costa Rica, Sub-Secretary, Foreign Affairs; National Deputy; President, National Assembly; Secretary, Public Instruction; Minister Plenipotentiary, England, France and Spain, Colombia, and Cuba; and Secretary of Government and Justice, editor, *Biblioteca de Cultura Nacional*, founder, *El Heraldillo del Istmo, La Prensa*, and *El Tiempo*; member: Academias Panameñas de la Lengua and de la Historia; Sociedad de Artes y Letras de Cádiz, Past Grand Master of Grand Lodge (Masonic), Sovereign Grand Commander of the Supreme National Council of Thirty-third degree Scottish Rite, Shriner, Decorations. Order of Saint Saba (second class), Rumania; Order of Carlos de Céspedes (first class), Cuba; *Doctor Honoris Causa*, Faculty of Law and Political Sciences of Panamá; author of several books on a variety of subjects.

**Lewis, Samuel.** Illustrious Panamanian journalist, litterateur, scholar, and statesman, born Sept. 22, 1871, died Apr. 17, 1939. Secretary of State, Office of Foreign Affairs; Member, Commission for Preservation of National Monuments; Member Grand Council, Order of Vasco Núñez de Balboa; Member, Academias Panameñas de la Lengua (founder and director) and de la Historia (treasurer), and Corresponding Member, Academias de la Historia de Bogotá and de Caracas, Sociedad Geográfica de Lima, Sociedad de Geografía e Historia de Guatemala, and Ateneo de San Salvador. He was also Gran Cordon de la Orden del Libertador (Venezuela), Medalla de Honor de Instrucción Pública (Venezuela), Officer d'Instruction Publique (France), and Grand Cross of Vasco Núñez de Balboa (Panamá). Among his most important publications are. *Apuntes y conversaciones* (1925), followed by *Anotaciones al 'Tomborrio' de Agustín del Sar, and Retazos*, in preparation at the time of his death and published posthumously, in 1940, accompanied by many tributes published about the author.

**Peru. Fiction.** Ciro Alegría, *Los Perros hambrientos*, a keen study of shepherd life in the highlands of Peru; Luis E. Valcárcel, *Cuentas y Leyendas Incas* and *Garciلاس El Inca, visto desde el ángulo indio*, both of these books are real contributions to the problem of the Indian, the former treating it sentimentally and the second realistically, along with clear evidence of the author's own affection for the Indian; Fernando Romero, *Mar y Playa*, the author, although a sailor by profession, is an enthusiast in the folklore of the Negro in Peru. He helped organize La Insula, an institute for the study of folklore and Peruvian civilization. Angélica Palma, *La Sombra Alucinante*, a posthumous work published by her sister, Renée Palma. The volume takes its name from the first of two novelettes, the other of which is *Al azar*; the volume includes also a short story, *Dos hipótesis*. Although not of the author's best work, they do suggest her ability to do interesting psychological work without resorting to verbosity, and they are a welcome addition to our knowledge of the author.

**Versé.** César Vallejo, *España, aparte de mí este cáliz* (15 poems, with a preface "Profecía de América" by Juan Larrea), fine poems about the Spanish War.

**Puerto Rico. Erudition.** María Cadilla de Martínez, *Juegos i Canciones Infantiles de Puerto Rico*, a valuable book to put beside her earlier book concerning songs and popular games in the *Jardín de Borinquén*; Rubén Gotay-Montalvo, *Mientras Arde la Hoguera (apuntes de un corresponsal combatiente)*, a Puerto Rican law student's account of his experiences in the Republican army in Madrid and among the Aragonese peasantry.

**Drama.** Manuel Méndez Ballester, *El Clamor de los Surcos (Drama en Tres Actos)*, this play won first prize and Diploma of Honor of the Puerto Rican Ateneo in a contest for theatrical works held in 1938; first performance, Dec. 15, 1939, and by the same playwright, *Tiempo Muerto (Tragedia en Tres Actos)*, with a laudatory and critical essay by José A. Balseiro.

**El Salvador.** For reasons directly connected with the turmoil through which the World is passing at present, we have been in arrears of literary happenings in El Salvador for two or three years. The Academias Salvadoreñas de la Lengua y de la Historia, on Feb. 19, 1939, held a joint session to take action with the Committee from San Miguel (natal city of the great teacher, Francisco Gavidia) for the coronation of the illustrious Salvadorean. The coronation was approved and occurred Mar. 26, 1940. He had been previously granted a Gold Medal, a life pension, and later the title of Honorary Director of the National Library, wherein should hang his portrait.

**Necrology.** During a relatively long period the Academy was obliged to suspend its activities, and during that period it lost six of its members through death. In due time the vacancies of Velado, Masferrer, and Guzmán were filled by the election of Drs. Julio Enrique Ávila, Hermógenes Alvarado, and José Llerena h., respectively.

**Velado, Calixto.** The previous President of the Academy, the exquisite poet, who shone like a star of the first magnitude in the Parnassus of El Salvador.

**Guzmán, Dr. David J.** A notable physician, orator, naturalist, and statesman, serving as deputy, sub-secretary, minister of foreign affairs, and inspector general of primary schools. He organized the national museum and the national library of El Salvador, the museum of Nicaragua, and published numerous scientific works, such as, *Topografía física y médica de El Salvador*.

**Fortín, Dr. Miguel A.** Secretary of the Academy, a distinguished professional in the forum and the chair.

**Masferrer, Alberto.** A professor who made of his Chair and the Press a luminous point from which to spread abroad human justice, in chaste prose and verse.

**Belloso y Sánchez, Msgr. Alfonso.** An apostle so filled with faith that he considered nothing, however difficult, as "impossible" if it would work for the "public" welfare.

**Llana, Prof. Juan J.** He was a great teacher, a fine painter, and an authority on the linguistics of the pre-colonial languages.

**Pinto, Miguel, p.** After a life devoted to activities of positive profit to the nation and especially in the career of journalism, died in San Francisco on Aug. 10, 1940, whither he had gone in search of health.

**Fiction.** Ignacio Vázquez, *El Centauro*, a pleasing novel about Salvadorean life, by the talented Official Mayor of the Ministry of Government.

**Erudition.** Dr. Rafael González Sol, *Historia del Arte de la Música en El Salvador*; Miguel Ángel García, *Diccionario Histórico Enciclopédico de El Salvador* (vol IX of a highly praised work).

**Uruguay.—Erudition.** *Homenaje al poeta Federico García Lorca contra su fusilamiento. Prosas de Pablo Neruda y Emilio Oribe.* III aniversario. 1936-39. Carlos Vaz Ferreira, the learned Rector of the University of Montevideo, published two books containing five lectures that he delivered at the University of Buenos Aires, entitled *La actual crisis del mundo (desde el punto de vista racional)*

and *Transcendentalizaciones matemáticas ilegítimas*; Fernando García Estéban, *Vida de Florencio Sánchez*, a more detailed study of the Uruguayan playwright than any other biographer has given was made possible because the author had personal conversations with the widow and actual access to many letters unknown to previous authorities.

**Necrology.** The deaths are recorded of the following writers:

**Garrón, Eugenio.** Uruguayan journalist, writer, and statesman, took part in the revolutions of El Quebracho and Tricolor; was deputy and senator during various periods until the coup d'état of 1898. Thereupon he went to Paris and worked in the editorial office of *Le Figaro*, where he wrote frequently concerning American questions. In 1918 the government of Uruguay appointed him financial agent in Paris. Among other things, he published *Jean Orli, Une campagne; L'Europe dans l'Amérique Latine; La République Argentine: Son histoire, Sa vie économique, Ses finances, et L'Amérique du Sud au XX<sup>e</sup> siècle: L'Argentine et l'Uruguay*.

**Luis, Luisa.** Uruguayan poetess, critic, and journalist; died Apr. 10, 1940. She worked on the staff of *La Razón* of Montevideo, and her book *Senar* (1916), won high praise from the critics for its finished form, depth of sentiment, and human emotion. She wrote two other volumes of verse: *Inquietud* (1922), *Poemas de la inmovilidad* (1926), and two volumes of criticism *Dos grandes maestros. Rodó y Reyles* and *A través de libros y autores* (1925).

**Venezuela. Fiction.** Julián Padrón, *Madrugada*, his second novel, surpassing even his sensationally successful *La Guaricha*; marvelously clear-cut, restrained style.

**Verse.** Jacinto Fombona-Pachano (author of *El Batallón*, short novel; *El Canto del Hijo*, poem; *Virajes*, poems; and *Evolución de la Poesía Moderna Venezolana*, essay) published as the poetic fruit of his sojourn as a diplomat in the United States, the dainty little volume of verse entitled *Las Torres Desprevenidas*.

**Drama.** Julián Padrón, *Parásitas Negras (sainete en tres actos y siete cuadros)*, the author's second work for the theater, *Fogata* being his first.

**Erudition.** E. Gil Borjes, *Discursos en homenaje al Libertador*; Martín J. Gornes Mac-Pherson, *Sangre de Asia en América* (through excavations of his own the author is well-grounded in his discussions of the sources whence came the pre-Columbian visitors to South America). *Proclamas i Discursos del Libertador (Publicación Oficial por decreto del Presidente de la República)* (important volume of 452 pages highly illustrated). Thomas Rourke, *Man of Glory, Simón Bolívar*. The author had already proven his ability with a work entitled, *Gómez—Tyrant of the Andes*. The present work profits from the experience gained in writing the earlier book and Bolívar emerges in a way to earn the other part of the title. Mariano Picón Salas, 1941, a volume of essays by a distinguished Venezuelan who, after many years of exile in Chile, returned to his native land after the death of the dictator, Juan Vicente Gómez, and now deals with the past and present Venezuelan nation.

JOHN D. FITZ-GERALD.

**SPANISH GUINEA.** See SPAIN under *Colonial Empire*.

**SPANISH LITERATURE.** The general state of unrest throughout the world has made it very difficult to assemble materials for articles such as this. For that reason it is more appropriate than ever to say that the treatment is not exhaustive. Nevertheless, some things have reached us and the following are not without interest in the Hispanic field.

**Verse.** José D. de Quijano, *El Madrid del 800* and *Blasón (Versos de la Cárcel)*; José Carner, *Nabi (Poema)*, originally written in his native

Catalán, in 1939 he translated it into Castilian; Federico García Lorca, *Poeta en Nueva York*, with four original sketches, a poem by Antonio Machado and a prologue by José Bergamín—frankly pro-loyalist

**Fiction.** Ricardo León, *Varón de Deseos* (2d ed.), *Jauja* (2d ed.); *Bajo el Yugo de los Bárbaros* and *Roja y Gualda* (both 2d eds. of works that first appeared 1932 and 1934 respectively as first two volumes of a series *Jornadas de la Revolución*); Ramón J. Sender, *El lugar del Hombre*, a powerful novel of the turmoil of the world today, and of the turmoil within Spain; Joaquín Álvarez Quintero published late in 1939 a volume of tales (*cuentos*), *Con Los Ojos*; José Herrera Petere, *Niebla de Cuernos* (lawyer, and officer on the staff of the Loyalist Army, pro-Loyalist); A. Palacio Valdés, *Album de un viejo* (segunda parte de la "novela de un novelista"), a posthumous work in one volume; José María Pemán, *Romance del Fantasma y Doña Juanita*, a novel, with illustrations by Teodoro Delgado.

**Drama.** *Dies comedias del siglo de oro: An annotated omnibus of ten complete plays by the most representative Spanish dramatists of the Golden Age* (ed. by H. Alpern and J. Martel); Lope de Vega, *El Palacio confuso* (together with a study of the Menaechmi theme in Spanish literature by C. H. Stevens); Guillén de Castro, *Las Mocedades del Cid* (ed. by G. W. Humphrey with introductory notes); Tirso de Molina [Gabriel Téllez], *El Burlador de Sevilla, El condenado por desconfiado, La prudencia en la mujer* (ed. with introduction by P. Henríquez Ureña). Joaquín Álvarez Quintero finished several comedies that were to be produced during that season, but none was published during the year; José María Pemán, *La Danza de los velos* (comedia en tres actos y en prosa), and *De ellos es el mundo . . .* (pelicula representable en un acto y cinco cuadros).

**Erudition.** Erudition has been more prolific than the other branches. Angel González Palencia, *La España del Siglo de Oro*; Luis Torres and A. Ruiz Castillo, *Miguel Fleta: el Hombre, el "Drvo," y su Musa*; Leonardo Martín Echeverría, *España: El País y los Habitantes*, highly illustrated, with 155 intercalated figures, 160 plates, and 14 maps *hors texte*; Adolfo Salazar, *Música y sociedad en el siglo XX: Ensayo de crítica y de estética desde el punto de vista de su función social*; Marqués de Santillana, *Prose and Verse*, chosen by J. B. Trend, with an excellent *Introduction*; Lope de Vega, *Del monte sale (quien el monte quema)*, (Palaeographic ed. with excellent studies and notes by Emilio Le Fort Peña); Agustín de Rojas, *El natural desdichado* (with introduction and notes by James White Crowell); *Cinco ensayos sobre don Juan* (ed. with prologue by A. Castro, contains essays by Gregorio Marañón, Ramiro de Maeztu, José Ingenieros, Azorín, and Ramón Pérez de Aya), Juan Ruiz de Alarcón, *La Verdad sospechosa* (ed. by P. Henríquez Ureña and J. Bogliano); María Zambrano, *Pensamiento y poesía en la vida española*; Eugenio d'Ors, "Nuevo glosario"—"La tradición, Introducción a la vida angélica (cartas a una soledad), *Glosas a Portugal* (all the foregoing published in Buenos Aires), and two new editions of his artistic studies, *Tres horas en el Museo del Prado*, and a new work, *Jardín Botánico*; José María G. de la Torre, *Ricardo León o el genio de la lengua* (Ensayo crítico del libro "El Amor de los Amores"); Lucy Elizabeth Weir, *The Ideas Embodied in the Religious Drama of Calderón*, a careful study of an important ques-

tion; Salvador de Madariaga, *Christopher Columbus*, an important work presenting Columbus as a real human being, in the author's own English; Isabel de Palencia, *I Must Have Liberty*, important for an understanding of Spain's present position in the world, author has grown with the country and helped it to develop—in the author's own English; Marqués de la Cadena, *El gran cardenal de España, D. Pedro González de Mendoza* (estudio histórico-biográfico); Jesús Bal y Gay, *Romances y Villancicos españoles del siglo XVI*, an important work arranged in modern notation for piano and voice; Flérida de Nolasco, *De Música Española*, based on Julián Ribera's work on the *Cantigas* of Alfonso el Sabio, she has identified several Cuban and Dominican dance forms; José Bergamín, *El Alma en un hilo* (Vol. 3 of a series entitled, *Disparadero español*); Narciso Alonso Cortés, *Cofrades de Santa María de Esgueva* (Miscelánea Vallisoletana, 6ª Serie), valuable studies by the Director of the Academia de Bellas Artes de Valladolid; Gregorio Marañón, *Don Juan*, another of the psychological studies of great characters in history and legend, to which this great physician and surgeon has accustomed us; Américo Castro, *The Meaning of Spanish Civilization*, inaugural lecture as Professor of Spanish at Princeton University; Augustus Campbell Jennings, *A Linguistic Study of the Cartulario de San Vicente de Oviedo*; Alfonso Martínez de Toledo: *El Arcipreste de Talavera, o sea El Corbacho* (newly edited according to the Escorial Codex, by Lesley Byrd Simpson); Ronald Hilton, *Campoamor, Spain, and the World*, an important study of an interesting period in the history of Spanish culture; Baltasar Gracián, *El Criticón* (edición crítica y comentada por M. Romera-Navarro), (the third volume); Pedro Salinas, *Reality and the Poet in Spanish Poetry*, six lectures given in 1937 at the Johns Hopkins University, delightful and thought provoking; Victor R. B. Oelschlager, *A Medieval Spanish Word-List*; John Tate Lanning, *Academic Culture in the Spanish Colonies*, a soundly documented account of the creation and rise of universities in Spanish America; John Van Horne, *Bernardo de Balbuena—biografía y crítica*, a patient work of love carried to fulfillment over a score of years; and two very important works by the great master of Romance philology and Spanish literature and history, Ramón Menéndez Pidal: a long hoped for sixth edition, corrected and enlarged, of his *Manual de Gramática Histórica Española*, and a new printing of the second edition of his *Antología de prosistas españoles*.

The Royal Spanish Academy. On Jan. 15, 1915, Ricardo León took formal possession of his chair in the Spanish Royal Academy of the Language. At about that date in 1940 the Academy celebrated, with due ceremony, the twenty-fifth anniversary of that earlier event.

**STAMP COLLECTING.** On May 6, 1940, the postage stamp was 100 years old. The adhesive designed by Rowland Hill created philately, the hobby of stamp collecting. The year 1940 was a twelve-month of strife and little, relatively, was done to observe an event that revolutionized one of the earliest forms of communication—the letter.

In Britain, where the postage stamp was born, a great international exhibition was cancelled because of war and the celebration was limited. The embattled Britons did note the event, however, with a special series of stamps incorporating the design of Hill, Queen Victoria on the "Penny Black," the first stamp, with that of more recent issues showing a profile of King George VI. Several other nations also issued stamps for the anniversary, but the international aspect of the celebration was shattered by gun-fire and bombs.

In the Americas, nations of the Pan American Union observed twenty-five years of amicable relations, most of them issuing stamps for the occasion. In Europe, conquered people saw their stamps defaced by strange printing of the conqueror.

In Poland, Belgium, the Netherlands, Denmark, Norway, and Luxemburg native issues were surcharged in German, replaced by new stamps from Germany or their values raised to care for the increased cost in distribution. Lithuania, Latvia, and Estonia surrendered to Russia and their stamps, too, took on a new look. Finland, which opposed the Soviet Republics, used stamps to raise funds for its lost cause.

Stamps of France were overprinted and Germany once more considered Alsace and Lorraine part of the Reich, surcharging German stamps for use in these districts. Rumania dropped a king for a satellite and a dictator and posthumously honored the slain leader of forces which drove it into domination by Germany. Rumania, under pressure, surrendered soil to the U.S.S.R., Hungary, and Bulgaria and these nations marked their gains with stamps.

Britain's blockade of the axis powers forced Germany to route its international mail through Russia and Japan. Italy sent its mail by air, via Africa and the South Atlantic to South America and up that continent's west coast to escape British censorship and confiscation.

Among peaceful pursuits observed was the opening of air mail service between the United States and New Zealand and the appearance of a new name among postage stamp issuing countries—Pitcairn Islands, the major island of the group being the home of the historic mutineers from H.M.S. *Bounty* and Captain Bligh.

While other nations were subjected to conquerors, the United States saw fit to remember that slavery no longer existed within its borders with a stamp celebrating Abraham Lincoln's Emancipation Proclamation. The United States also commemorated the activities of thirty-five of its citizens who by peaceful means had become its "Heroes of Peace," as the series was called—educators, artists, poets, authors, scientists, composers, and inventors being among those honored. Stamps marked the fiftieth anniversaries of the admission to statehood of Idaho and Wyoming, the four hundredth anniversary of Coronado's explorations of the southwest, and the historic services of the Pony Express. Along less peaceful lines, the United States commemorated its effort to re-arm with three stamps.

The world's most valuable stamp, the one-cent-

magenta British Guiana of 1856, was sold by the heirs of the late Arthur Hind for a price reported at \$40,000.

The nations of the world issued more than 2000 stamps in 1940.

DAVID LIDMAN.

**SUEZ CANAL.** A sea-to-sea canal across the Isthmus of Suez, providing passage for ships between the Red Sea and the Mediterranean. Operated by the Suez Canal Company, holding a concession from the Egyptian Government; normal main route between maritime Europe and the ports of the Indian and western Pacific oceans.

Use of the Suez Canal fell off progressively during the first 16 months of the European War. For September, 1939, shipping traffic was less than half of the volume of September, 1938; and for August, 1940, the number of vessels using the canal, only 43, came to less than one-tenth of the corresponding number, 458, for August, 1939, the last month before the start of the war.

In the entire calendar year 1939 (of which the last third fell within the European War), the canal passed 5227 ships totaling 29,573,000 net tons. In 1938, ships' passages numbered 6127; their aggregate net tonnage was 34,523,084; their passengers numbered 464,126. Great Britain accounted for 50.4 per cent of the tonnage of 1938, Italy for 13.4; Germany, the Netherlands, France, and Norway followed in importance. Of that year's tonnage of shipping, the northward-bound exceeded the southward by some 1,100,000 tons. Actual weight of goods transported through the canal, somewhat

less than the tonnage just stated, came to 28,779,000 tons.

A convention of 1888 exempted the canal from blockade in time of war; but the blockading operations of both the belligerent parties in the Mediterranean rendered it impracticable for belligerents of either side to make general use of the canal in 1940. In September, 1940, the Suez Canal Company suspended the payment of dividends.

See EGYPT under *History*; EUROPEAN WAR.

**SUGAR.** The sugar-beet crop in the United States in 1940 was estimated by the U.S. Department of Agriculture at 11,969,000 tons of beets from 921,000 acres, expected to produce about 1,729,000 tons (equal to 1,850,000 raw ton basis) of sugar, compared with the 10,781,000 tons of beets, 917,000 acres, and 1,643,000 tons of sugar in 1939, the 1929-38 average of 8,937,000 tons of beets from 792,000 acres and 1,300,000 tons of sugar. The acre yield was 13 tons versus 11.8 tons in 1939 and 11.3, the 10-year average. The 1940 sugar yield per acre harvested was indicated at 188 tons, compared with 1.79 tons in 1939 and 181 tons in 1938, but sugar recovery was indicated at a lower figure than in 1939 and 1938. Production of beet sugar in leading States was estimated for California 448,000 short tons, Colorado 310,000, Montana 166,000, Michigan 161,000, Idaho 142,000, and Nebraska 111,000 tons. Production of sugar-cane for sugar in 1940 was marked by a very adverse season in Louisiana and a favorable outturn in Florida. The 1940 sugar-cane crop of the two States, including cane for seed, was grown on 259,000 and 30,400 acres respectively, and was estimated as 3,335,000 and 1,216,000 tons, equivalent to 242,000 and 116,000 tons of sugar. Molasses as a sugar-cane by-product totaled 24,786,000 gal. Sugar-cane sirup produced in eight southern States totaled 14,809,000 gal and the sorgo sirup made in 16 States amounted to 11,865,000 gal. Maple products reported by 10 States included 2,628,000 gal of sirup and 629,000 lb. of maple sugar. The 1940 maple season in general was both late and short in most States producing maple products. In New England operations were hampered by deep snows and storms.

World sugar production, as depicted in *The World Sugar Situation* (U.S. Dept. Agri., 1940), increased sharply from 1918 to 1930, declined slightly during the early depression years, and then increased sharply to a new record high in 1936. Production in 1939 was indicated to be the third largest on record. Sugar production in the principal importing countries increased steadily from 1918 to 1936; that in the principal exporting countries fluctuated widely but the general level increased very little in the last decade.

The world's cane-sugar production for the 1940-41 season, according to estimates of Willett and Gray issued Jan. 18, 1941, amounted to 18,570,894 tons. Production in leading world areas was: Louisiana 209,821 tons, Florida 105,715, Puerto Rico 810,325, Virgin Islands 7500, and Hawaii 865,000; Cuba 2,300,000; Dominican Republic 375,000; Mexico 295,000; Peru 450,000; Argentina 500,000; Brazil 1,272,405; British India, gur (low grade) 3,100,000, and white sugar 1,212,000; Java 1,750,000; Japan 1,176,530; Philippine Islands 1,087,000; Australia 825,000; Mauritius 326,000; and Natal 510,000 tons. The world's beet-sugar production in 1940-41 was estimated to total 10,867,750 tons, including United States 1,543,000; Canada 90,000; Germany 2,400,000; Czechoslovakia 520,000; Poland 500,000; U.S.S.R. (Russia and Ukraine)

2,700,000; Great Britain 485,000 and Ireland 90,000; Italy 475,000; Sweden 300,000; France 238,000; Belgium 250,000; Netherlands 285,000; and Denmark 245,000 tons. The grand world total for 1940-41 was estimated at 29,438,644 tons compared to 30,339,831 tons in 1939-40 which comprised 19,210,603 tons of cane-sugar and 11,129,228 tons of beet-sugar. See AGRICULTURAL ADJUSTMENT ADMINISTRATION; CUSTOMS, BUREAU OF.

**SUICIDES.** See VITAL STATISTICS.

**SULFANILAMIDE AND DERIVATIVES.** See BIOLOGICAL CHEMISTRY; MEDICINE AND SURGERY; VETERINARY MEDICINE.

**SULLIVAN COLLECTION.** See ART under *Art Sales*.

**SULPHUR.** According to the Freeport Sulphur Company, the domestic industry had on hand in 1940 an adequate supply of sulphur for all of the varied needs of national defense. This condition was in marked contrast to that prevailing in 1918 when the supply of sulphur was one of the major worries of the Government. In 1940 the industry had a two-year supply above ground and ample resources.

Production for 1940 is estimated at 2,753,000 tons. Shipments amounted to 2,554,000 tons, of which 725,000 tons was exported. Inasmuch as production was in excess of total shipments, substantial tonnage was added to stocks above ground, which were probably in excess of 4,000,000 tons. This reserve was augmented by the importation of about 38,000 tons of sulphur shipped into the Pacific Northwest from Trail, B.C.

**SUPERMARKETS.** See MARKETING.

**SUPREME COURT, U.S. Literature.** The Supreme Court's Sesquicentennial was observed in Washington, February 1, with addresses by the Chief Justice, the Attorney General, and President Beardsley of the American Bar Association (309 U.S. v-xv; 26 *A.B.A.Jnl.* 171, 199, 203, 207-8, the latter containing a list of all of the Court's members). "The First Decade," 7 *U. of Chicago L. Rev.* 631 (Charles Warren); "Mr. Justice Miller (1862-90)," pp. viii, 456 (Chas. Fairman; reviewed, 26 *A.B.A.Jnl.* 59); "Chief Justice Fuller," *ib.* 691 (F. J. Loesch); "Mr. Justice Brandeis," (1916-39), 16 *Tenn.L.Rev.* 441 (R. B. C. Howell); "Tradition and Judicial Review," 26 *A.B.A.Jnl.* 208 (K. C. Umbreit); "American Democracy and the Supreme Court," 14 *Temple U.L. Quar.* 210 (F. Paddock).

**Work.** The October, 1939, term ended June 3, 1940, with 946 cases disposed of, in 151 of which individual opinions were written and in 97 more *per curiam* opinions. The October, 1940, term began on October 7. Justice Murphy had meanwhile taken his seat on February 5. (See an "Appraisal" by Dean Bates, 26 *A.B.A.Jnl.* 107). "Business at the October Terms, 1937, 1938," 53 *Harv.L.Rev.* 579 (H. M. Hart); also as to 1938, 26 *Va.L.Rev.* 1, 274, 697 (Moore & Adelson); "Review of Three Judge Court Decisions," 8 *G.W.L.Rev.* 31. On May 16, Chief Justice Hughes explained to the American Law Institute the functions of the Administrative Office of the United States Courts (1939 YEAR BOOK 420) which now works in two divisions, (1) Business Administration and (2) Procedural Studies and Statistics. (26 *A.B.A.Jnl.* 472, 723).

**Decisions. Constitutional.** Current articles

picture the present as a period of constitutional change; e.g. "Constitution Making by the Supreme Court Since 1929," 15 *Ind.L.Jnl.* 179 (H. E. Willis); "Recent Developments in Federal Jurisprudence," 73 *U.S.L.Rev.* 513 (A. Holtzoff); "Shifts in Constitutional Doctrines," 25 *A.B.A.Jnl.* 629 (F. J. Hogan); "Changing Constitutional Phases," 19 *Boston U.L.Rev.*, 509 (T. R. Powell); "Some Aspects of Am. Constitutional Law," 53 *Harv.L.Rev.* 529 (*id.*). The Supreme Court's decisions (1939 YEAR BOOK 420) that ratification of constitutional amendments is a political question, are discussed in 53 *Harv.L.Rev.* 134; 39 *Columbia L.Rev.* 932; 26 *A.B.A.Jnl.* 617; 24 *Minn. L.Rev.* 393; 17 *N.Y.U.L.Quar. Rev.* 122; 13 *So. Cal.L.Rev.* 122.

**Sovereignty.** A State statute purporting to void claims against a decedent's estate if not filed within a specified time, may not be invoked against the United States. *U.S.v.Summerlin*, 310 U.S. 414. And its immunity from suit, except by permission, applies to a cross-claim (in a proceeding by it) in excess of the original claim. *U.S.v.U.S. Fidelity & Guaranty Co.*, 309 U.S. 506.

**Separation of Powers.** A second award of compensation under a private act of Congress, passed nearly five years after the original award under the Longshoremen's Act, does not invade the judicial function nor infringe due process. (Const. Am'dt. V) *Paramino Lumber Co. v. Marshall*, 309 U.S. 370.

**Constitutional Provisions Construed.** (Numerals at left indicate article, section, and paragraph of U.S. Const.)

1,8,(1). The legislative power "to lay . . . imposts," is exclusive and, when delegated to the President, is not subject to judicial review. *U.S. v. George S. Bush & Co.*, 310 U.S. 37. (But see *Panama Refining Co. v. Ryan*, 293 U.S. 433.)

1,8,(3) (interstate commerce) is infringed by a State statute imposing a sample-room tax on a non-resident retailer, "the actual effect of which is to discriminate in favor of intrastate business," (*Best & Co v. Maxwell*, 311 U.S. 454). A complaint of "conspiracy to monopolize the bill-posting business on the Pacific coast . . . to the great injury and damage of plaintiff," states a cause of action under the Sherman Act (*C. E. Stevens Co. v. Foster*, 311 U.S. 255) which also supported the prosecution in *U.S. v. Socony-Vacuum Oil Co.* (310 U.S. 150) of 12 or more oil companies and various individuals charged with having "combined and conspired" to raise artificially prices of gasoline, etc. A jury found them guilty and the district court's sentence (\$5000 fine for each corporation and \$1000 for each individual) was affirmed by the Supreme Court, reversing the Court of Appeals. But the Sherman Act was held inapplicable to a "sit-down" strike (*Apex Hosiery Co. v. Leader*, 310 U.S. 469). Whether payment of mileage, earned by leased tank-cars and credited to the lessee constitutes a "rebate" under the Elkins Act, is an administrative problem, and when suit is brought therefor the court should await the ICC's determination (*Gen. Am. Tank Car Corp. v. El Dorado Terminal Co.*, 308 U.S. 422).

1,8,(17). The "exclusive legislation" which Congress may exercise over a Post Office site is political only. Until actually exercised on a given subject (e.g. Labor) the existing State laws continue (*James Stewart & Co., Inc. v. Sadrakula*, 309 U.S. 94). IV, 1, requiring "full faith and credit" for judgments, "precludes inquiry into the merits of the cause (in which the judgment was rendered),

the logic or consistency of the decision, or the validity" of its basic principles. *Milliken v. Meyer*, 311 U.S.

**Amendment V.** Eminent Domain "is within . . . the constitutional power" of the U.S. Government; its contractee is not liable for acts in the exercise thereof and right of recovery in the Court of Claims provides for compensation (*Yearsley v. Ross Construction Co.* 309 U.S. 18).

**Amendment XIV.** Price-fixing by statute is not necessarily invalid (*Mayo v. Canning Co.*, 309 U.S. 310, 318), and a State statute penalizing conspiracies to fix prices, except for "agricultural products or livestock," was held not to infringe the "equal protection clause" (*Tigner v. Texas*, 310 U.S. 141, overruling *Connolly v. Union Sewer Pipe Co.*, 184 U.S. 540). An oil proration order of the Texas Ry. Commission was challenged as "confiscatory," and the challenge was upheld by both district and circuit courts. The Supreme Court, with two dissents, reversed their judgments, pointing out the technical character of the question and declining "to supplant the Commission's judgment, even in the face of convincing proof that a different result would have been better." (*Ry. Com. v. Rowan*, 310 U.S. 573).

**Amendment XIV, 1** is not infringed by State legislation requiring insurance by licensed companies to be obtained "through regularly constituted, registered resident agents or agencies" who shall receive "the usual and customary commissions," not more than half of which may be shared by non-resident, licensed brokers; although the policy may have been "negotiated outside (the State) with an assured whose residence is outside . . . by an agent or broker living outside" (*Osborn v. Oslin*, 310 U.S. 53, with two dissents). In *Hansberry v. Lee*, 311 U.S. 32, "due process" was held lacking where a State court pronounced final, as to petitioners, a judgment upon an agreement (not to sell land to colored people) to which they were not parties and which imposed no joint liability.

So religious freedom was held to be infringed by a State act penalizing the solicitation of funds from the public generally, for a religious or similar purpose, or within the county where the recipient organization ("Jehovah's witnesses") is located; except with the approval of the Public Welfare Council's secretary (*Cantwell v. Connecticut*, 310 U.S. 296). But a requirement that public school teachers and pupils salute the national flag, infringes neither Amendment I nor XIV, both of which were held to be infringed by anti-picketing legislation of Alabama (*Thornhill v. Ala.*, 310 U.S. 88) and California (*Carlson v. Cal.*, 310 U.S. 106; county ordinance). These decisions led to the annulment of Oregon's popularly adopted anti-picketing law. A State statute was found not to be invalid for vagueness in *Minn. v. Probate Court*, 309 U.S. 270, 274.

**Procedure.** In the following cases the doctrine of *Erie R. Co. v. Tompkins*, 304 U.S. 94 (1938 YEAR BOOK 393) was applied by directing that the decision of an intermediate State court be followed: *West v. Am. T.&T. Co.*, 311 U.S. 223; *Six Companies v. Joint Highway Dist.*, 311 U.S. 180; *Fidelity etc. Trust Co. v. Field*, 311 U.S. 169; *Stoner v. N.Y.L. Ins. Co.*, 311 U.S. 464; the doctrine is inapplicable to a State court's interpretation of Federal law, *Kloeb v. Armour & Co.*, 311 U.S. 199; *Deitrick v. Greaney*, 309 U.S. 190; nor is a suit to enforce the statutory liability of joint stock land bank shareholders, subject to the State

statute of limitations. *Russell v. Todd*, 309 U.S. 280.

**Remedies.** The ground of Federal jurisdiction must clearly appear in a petition for *certiorari*. *McGoldrick v. Gulf Oil Corp.*, 301 U.S. 2. "Mandamus is the proper remedy" to compel a U.S. district judge to call associates, pursuant to Jud. Code sec. 1266, and pass on the constitutionality of a statute. *Ex parte Bransford*, 310 U.S. 354.

**Parties.** A private market dealer is not a "party in interest" who may sue to enjoin unnecessary extension of a railway line under Transportation Act (1920) sec. 402 (20). *L. Singer & Sons v. U.P.R. Co.*, 311 U.S. 295; nor may a private person sue, without consent of the United States, on the bond of a postmaster, though his negligence is alleged (*U.S. v. Nat. Surety Corp.*, 309 U.S. 165). But the defrauded purchaser of a "security" may sue to enjoin the transfer of issuer's corporate assets, regardless of "the amount in controversy or citizenship of the parties" and although the Securities Act of 1933 (sec. 12, 2) merely authorizes him "to recover the consideration paid," etc. (*Deckert v. Independence Shares Corp.*, 311 U.S. 282). Where the purchaser of a farm at a sale under Bankruptcy Act sec. 75, was not made a party to the farmer-debtor's appeal from the order of confirmation, the proper course is not dismissal, but citation of the purchaser (*Miller v. Hatfield*, 309 U.S. 1).

**Notice.** Under the Miller Housing Act of 1935, a material-man may recover on a contractor's bond, by sending (though not by registered mail as the act requires) a written notice which reaches one of the contractors, though not addressed to them (*Fleisher etc. Co. v. U.S.*, 311 U.S. 15). Designation of an agent for service of process "in any action in the state," includes one in the U.S. district court (*Okla. Packing Co. v. Okla. Gas & El. Co.*, 309 U.S. 4).

**Trial.** In *Smith v. Texas*, 311 U.S. 128, a Negro's conviction of rape was reversed upon a showing that in the same year and the previous one no Negro had served on the local grand jury, and not more than one in any of the preceding years. Likewise, confessions extorted from an accused, vitiate conviction (*Chambers v. Florida*, 309 U.S. 227; *White v. Texas*, 310 U.S. 530). But denial of a motion for continuance, after competent counsel have been assigned to the accused, is not a denial of "due process" (*Avery v. Alabama*, 308 U.S. 444).

**Findings and Judgment.** A decree enjoining, until final hearing, enforcement of the Florida Citrus Act was reversed for lack of "findings of fact upon . . . vital issues," under Procedural Rule 52(9) (*Mayo v. Lakeland etc. Co.*, 309 U.S. 310). But, in determining whether it shall grant or deny a license for broadcasting (not a common carrier activity) the FCC need not find whether economic injury to an existing station would result (*FCC v. Sanders etc. Station*, 309 U.S. 470). Under Procedural Rule 50(b) the grant of a motion for judgment is not a denial of an alternative motion for a new trial (*Montgomery Ward & Co. v. Duncan*, 311 U.S. 243). A decree pursuant to legislation subsequently declared unconstitutional, is, nevertheless *res adjudicata* (*Chicot Co. Drainage District v. Bank*, 308 U.S. 371), and alleged invalidity of the result of invoking a statute, whose constitutionality is not assailed, presents no question for the three judge court provided by sec. 266 of the Judicial Code (*Ex parte Bransford*, 310 U.S. 354). Legislative history of the "enlistment allowance" under

Act of June 10, 1922, reviewed and found to have been suspended during the fiscal year ending June 30, 1939, by a proviso of the appropriation act (*U.S. v. Dickerson*, 310 U.S. 554).

**Review.** "An order (of a district court) denying a motion to quash a subpoena duces tecum directing a witness to appear before a grand jury," is not a "final decision," which, alone, the circuit court is authorized to review (*Cobbledick v. U.S.*, 309 U.S. 323). A Deputy Commissioner's finding that a decedent was not "a member of the crew," under sec. 3 of the Longshoremen's Act, and that his widow was entitled to compensation, was upheld as supported by evidence (*So. Chicago etc. Co. v. Bassett*, 309 U.S. 251). An FCC order refusing consent to the assignment of a radio-station license, is not an order refusing such license and is not appealable (*FCC v. Columbia Broadcasting System*, 311 U.S. 132). Applicable legislation, enacted while a case is pending, for review, will be applied by the appellate court (*Carpenter v. Wash Ry. Co.*, 309 U.S. 23). Where it is uncertain whether a State court decided a case under the State or the Federal Constitution, the Supreme Court will remand the case for clarification (*Minnesota v. Nat. Tea Co.*, 309 U.S. 551).

**Miscellaneous. Bankruptcy.** By general order, the Rules of Civil Procedure are made applicable in bankruptcy, so far as practicable" (Stone J. in *SEC v. U.S. Realty Co.*, 310 U.S. 434, 468). The SEC may be permitted to intervene in proceedings under ch. xi of the Bankruptcy Act, though it has no pecuniary interest therein (*ib.*). A farmer-debtor's petition under sec. 75 of the Act, subjects him and his property to the U.S. district court's exclusive jurisdiction; without its consent, no State court may exercise jurisdiction thereof (*Kalb v. Feuerstein*, 308 U.S. 433). Leave to sell property under deeds of trust, without entry of the required stay order, is reversible error (*Borchard v. Cal. Bank*, 310 U.S. 311). The farmer-debtor must be given opportunity to redeem at a value fixed by the court, before a public sale of his property is ordered (*Wright v. Union Central L. Ins. Co.*, 311 U.S. 273; but cf. *Union etc. Bank v. Byerly*, 310 U.S. 1). A U.S. district court which granted a lien on railway property, under reorganization in another bankruptcy court, was upheld in *Warren v. Palmer*, 310 U.S. 132. The court may order sequestration of disputed oil and refer the question of title to the highest court of the State in which the oil is located (*Thompson v. Magnolia Petroleum Co.*, 309 U.S. 478). A prior execution lien on the debtor's property is not automatically released by an adjudication in bankruptcy, but may be preserved for the benefit of the bankrupt's estate (*Fischer v. Pauline Oil & Gas Co.*, 309 U.S. 294). Where a plan for composition of a municipality's debts was confirmed without fully informing creditors of its fiscal agent which owned a considerable block of the municipal bonds and acted in a dual capacity, confirmation was set aside (*Am. etc. Ins. Co. v. Avon Park*, 311 U.S. 138). Appeals from compensation orders may not be taken as of right, but are discretionary with the Court of Appeals (*Dickinson Industrial Site v. Cowan*, 309 U.S. 382). The time for appeal runs from the denial of a motion for rehearing, considered on its merits (*Bowman v. Lopereno*, 311 U.S. 262).

**Contracts.** A clause in a telegraph contract, limiting to \$500 the company's liability for delay, etc., prescribes a maximum and not liquidated damages (*Western U. Tel. Co. v. Nester*, 309 U.S. 582). A State statute regulating the withdrawal of building

and loan association shares is a valid exercise of the police power, paramount to the issuer's obligation to permit withdrawal (*Veis v. 6th Ward B. & L. Ass'n.*, 310 U.S. 32; dist. *Treigle v. Acme etc. Ass'n.*, 297 U.S. 189). "Public Contracts Act," requiring contractor to pay prevailing minimum wages "in the locality . . . as determined by the Secretary of Labor," vests no right in prospective bidders, even though such determination may have been erroneous" (*Perkins v. Lukens Steel Co.*, 310 U.S. 113).

Use of a machine which infringed no existing patent when first marketed, will not be enjoined, although it comes within the terms of a subsequently enlarged and reissued patent (*Sontag Chain Stores Co. Ltd. v. Nat. Nut Co.*, 310 U.S. 281).

**Powers.** The "general power of appointment" mentioned in the 1926 Revenue Act (sec. 302, f) covers a power to "appoint to anyone, including his own estate and his creditors" (*Morgan v. Com'r.*, 309 U.S. 78).

**Public Domain.** The government's grant to San Francisco of lands and rights in the Hetch-Hetchy Valley, conditioned upon non-transfer to a public utility, was held to have been unlawfully used and such use was enjoined in *U.S. v. San Francisco*, 310 U.S. 16. In *U.S. v. Nor. Pac. R. Co.*, 311 U.S. 317 the Court found various breaches of the conditions upon which a land grant of 1863 had been made to the company and remanded the cause to the district court for further proceedings.

**Territories.** The limit of corporate land ownership to 500 acres, by the Puerto Rico Organic Act (sec. 39), which is not "a law of the United States" and provides no penalty, is nevertheless enforceable by *quo warranto* proceedings, authorized by the territorial legislature (*Puerto Rico v. Rubert Hermanos, Inc.*, 309 U.S. 543) which, "in the exercise of its police power," may "prohibit bulk shipments of distilled spirits"; but not the use of trademarks thereon, affixed outside the territory, which would infringe the Inter-American Trade Mark Convention of 1929 (*Bacardi Corp. v. Domenech*, 311 U.S. 150). The Puerto Rican Supreme Court's ruling that awards under the local Workmen's Compensation Act may be enforced by distraint and may not be enjoined, found not "clearly and inescapably wrong" (*Bonet v. Texas Co.*, 308 U.S. 463).

**Waters.** In *U.S. v. Appalachian Power Co.*, 311 U.S. 377, the New River (Va. and W.Va.) was declared a navigable stream and so subject to Federal control; though two lower courts had held the contrary and 41 States joined in supporting them. "Flood protection, watershed development, recovery of the cost of improvements," as well as navigability, said Reed, J., "are parts of commerce control." Wyoming asked that Colorado be adjudged in contempt for diverting from the Laramie River more water than a previous decree permitted. The Supreme Court denied the petition without resolving the merits but admonished Colorado to keep strictly within the limits (*Wyoming v. Colorado*, 309 U.S. 572). Upon application of Illinois and the Chicago Sanitary District for more water from the St. Lawrence-Great Lakes watershed, a special master was appointed "to make a summary inquiry . . . and report" (*Wisconsin v. Illinois*, 309 U.S. 569).

**Boundaries.** The rule of prescription applied and that of "thalweg" (using the "thread," center, of a boundary stream) recognized; but the latter yields to the rule that a boundary is unalterable by avulsion (sudden and violent change), and the boundary between two States fixed at the center of

the original Mississippi main channel, now dry (*Arkansas v. Tennessee*, 311 U.S. 1).

See **INSURANCE**; **NATIONAL LABOR RELATIONS BOARD**; **WAGE AND HOUR ADMINISTRATION**. For comment on decisions see articles on each subject, as **ELECTRIC LIGHT AND POWER**.

C. SUMNER LOBINGER.

**SURETY BONDING.** See **INSURANCE**.

**SURGERY.** See **MEDICINE AND SURGERY**.

**SURINAM (NETHERLANDS GUIANA).** A South American colony of the Netherlands. Area, 54,291 square miles; population (Dec. 31, 1938), 173,089, including Negroes and Indians living in the interior. Education (1938): 122 schools and 20,911 students. Capital, Paramaribo, 52,760 inhabitants.

**Production and Trade.** Chief products: sugar, coffee, rice, maize, bauxite, gold, balata, bananas, salt, and cacao. Livestock (1938): 22,272 cattle, 4766 goats, 7196 swine. Trade (1938): imports, 6,861,756 guilders; exports, 6,609,139 guilders (guilder averaged \$0.5501 for 1938; \$0.5334 for 1939). Shipping (1938): 435 ships aggregating 486,001 register tons cleared.

**Government.** Finance (1940): local revenue, 4,189,000 guilders; state subvention, 3,328,000 guilders; expenditure, 7,517,000 guilders. The executive authority of Surinam is under the control of a governor who is aided by an advisory council. There is a representative body known as the States of Surinam, consisting of 15 members (10 elected by the voters, and 5 appointed). Governor, Dr. J. G. Kielstra (appointed Aug. 16, 1933). See *CURACAO* under *History* for the effect of the European War on the status of the Netherlands West Indies.

**SURPLUS MARKETING ADMINISTRATION (SMA).** The Surplus Marketing Administration is an agency of the U.S. Department of Agriculture. Under provisions of President Roosevelt's Third Reorganization Order effective June 30, 1940, administrative functions and responsibilities of the Federal Surplus Commodities Corporation and of the Division of Marketing and Marketing Agreements of the Agricultural Adjustment Administration were consolidated in the Surplus Marketing Administration. Funds derived from a sum equivalent to 30 per cent of the gross customs receipts of the previous year, as designated by Section 32, Public Number 320, approved Aug. 24, 1935, and additional funds which may be appropriated by Congress, are provided to carry on the various activities of this agency.

The Surplus Marketing Administration administers surplus removal and marketing agreement programs, developed to assist farmers in dealing more effectively with agricultural marketing problems complicated by war in Europe and Asia. Surplus removal programs are designed to encourage increased domestic consumption and to develop wider market outlets for farm products. Marketing agreement programs seek to stabilize markets and improve returns to producers by establishing more orderly selling conditions.

Several mechanisms have been developed by the Department for the purpose of dealing with agricultural surpluses. Principal among them are the food and cotton stamp plans, the school lunch program, and the low-cost milk program for moving increasing quantities of farm products into consumption among needy families. Also important are programs for direct purchase and distribution of surplus commodities, for diverting surpluses to by-products and to develop new uses and new out-

lets, and for encouraging exports, primarily of cotton goods and of wheat and wheat flour.

The Food Stamp Plan, started in May, 1939, has been extended gradually throughout the country. Where this plan is in operation, increased buying power in the form of blue-colored food stamps is placed in the hands of families eligible for public aid. These blue stamps are exchanged at local stores for foodstuffs officially listed as being in surplus. In order to obtain the free blue stamps, participants are in general required to buy specified amounts of orange-colored stamps to be used in the purchase of any food product. This requirement assures the continuance of normal expenditures for food. The blue stamps given with the orange-colored stamps bought make possible a 50 per cent increase in food buying power which is directed at moving designated agricultural surpluses into consumption through regular trade channels. Instead of the 5 cents a meal, which is about the average they have been spending, persons taking part in the plan have at least  $7\frac{1}{2}$  cents for each meal.

By the end of December, 1940, the Food Stamp Plan had been extended to 267 areas throughout the United States, and was actually operating in 226 of these areas. Nearly 3,000,000 low-income consumers were taking part in the plan, and new buying power at the rate of about \$5,000,000 a month was being spent for officially listed surplus foods at local stores in these areas. It is expected that by the close of the current fiscal year the Food Stamp Plan will have been extended to some 300 areas, and will be serving about 5,000,000 needy persons. New buying power at the rate of more than \$10,000,000 a month will then be made available for the purchase of listed surplus foods.

The general operating principles of the Food Stamp Plan are followed in the Cotton Stamp Plan. Under the plan for cotton, eligible persons have the opportunity of buying green-colored stamps in the same approximate amount that they formerly spent for clothing and household goods made from cotton. Minimum and maximum purchase rates are fixed and within those limits, for every dollar's worth of green-colored stamps bought, a dollar's worth of brown-colored stamps is given free. Both stamps are good in any retail store in the areas where the plan operates, in exchange for any product made entirely from American cotton and manufactured in this country.

Started in May, 1940, the Cotton Stamp Plan is being carried out on an experimental basis. By the end of December, it had been extended for testing in 16 areas, and operations were under way in 11 of these areas. While additional areas are to be designated for the Cotton Stamp Plan during the current fiscal year, extension of the plan will be gradual until its overall merit is firmly established.

An increasingly important outlet for surpluses of foodstuffs is being provided by the school lunch program for undernourished children. This activity depends largely on the co-operation and initiative of local civic, fraternal, educational, and welfare organizations. These groups assume the responsibility of operating the school lunch program in their respective localities. Surplus foods bought by the Surplus Marketing Administration and shipped to State welfare agencies for distribution to the needy are made available for use in the school lunches. Foods needed in addition to the surplus commodities are bought or otherwise obtained by the local sponsoring groups in order to provide the school children with well-balanced noon meals.

The school lunch program is being expanded materially. The objective for the current year is to reach 6 million undernourished children with the lunches made in whole or in part from surplus commodities. Last year about half this number of children were served in the peak month.

Under the direct purchase and distribution programs, a wide range of surplus farm products has been made available for distribution by State welfare agencies to public-aid families and for use in the school lunches. During the last fiscal year more than 3,000,000,000 lb. of surpluses of over 40 agricultural products were bought under the direct purchase activities. This involved a total expenditure slightly in excess of 117 million dollars. Direct purchases of agricultural surpluses are made as need arises for improving marketing conditions for individual commodities.

An opportunity for needy families to increase their consumption of milk is afforded by the low-cost milk programs operating in Boston, Chicago, Washington, New Orleans, and New York City. These programs supplement operations under Federal marketing agreement programs regulating the handling of milk in the respective markets. They are made possible by a Federal subsidy payment to handlers and a special price to producers for milk that is sold for use by eligible families at about 5 cents per quart. The low-cost milk programs bring into fluid consumption surplus milk which otherwise would be used for manufacturing purposes at lower prices to farmers. Further extension of low-cost milk programs to other marketing areas is contemplated.

New uses and wider outlets for agricultural surpluses are being encouraged for a number of farm products. During the current fiscal year, new uses being developed include those for making cotton bale covers, the use of cotton in the manufacture of insulation material, and the use of cotton in making writing paper. Surplus peanuts are being diverted to oil and other by-products, and the manufacture of starch is being encouraged through the diversion of surplus potatoes from regular trade channels. Surplus walnuts are being diverted to the shelling trade. Wider market outlets are being developed through a program for winter pears. Another program is encouraging sales of Puerto Rican Coffee in continental United States markets.

Export subsidy programs are operating on a more or less limited basis largely because of unsettled world conditions. One program is encouraging sales of cotton products to foreign countries. Exports of wheat and wheat flour are being assisted through another program which now applies to exports of wheat from Pacific coast ports to the Philippines or to European destinations, and to wheat flour from that area to the Philippines, and from all parts of the continental United States to any country or place in the Americas and adjacent islands, except Puerto Rico, Alaska, and the Canal Zone, and to islands east of the Americas lying on or west of 40° west longitude.

Marketing agreement programs are continuing to play an important part in stabilizing selling conditions for a wide range of agricultural commodities and in improving returns to producers. Altogether, 46 programs are in effect, 29 for milk and dairy products, and 17 for fruits, vegetables, and other crops. During the last fiscal year, the farm value of commodities sold under marketing agreement programs exceeded 400 million dollars.

Additional marketing agreement programs are expected to become effective during the course of

the current fiscal year. At the request of industry groups, preliminary steps are under way for the development of these new programs for a few fluid milk markets and for certain crops grown in concentrated producing areas. Operations under marketing agreement programs will continue to be supplemented by surplus removal activities.

MILF PERKINS.

**SVALBARD.** See NORWAY.

**SWAZILAND.** See BRITISH EMPIRE.

**SWEDEN.** A constitutional monarchy of Scandinavia. Capital, Stockholm. Sovereign in 1940, Gustaf V, who succeeded to the throne Dec. 8, 1907.

**Area and Population.** Sweden has an area of 173,341 square miles and a population estimated on Jan. 1, 1940, at 6,341,000 (6,250,506 at 1935 census). Live births in 1939 numbered 96,866 (15.3 per 1000); deaths, 72,753 (11.5); marriages, 56,725 in 1938; immigrants, 5756 in 1938; emigrants, 2062 in 1938. Estimated populations of the chief cities on Jan. 1, 1939, were: Stockholm, 570,771; Göteborg, 275,763; Malmö, 151,247; Norrköping, 69,434; Hålsingborg, 61,365.

**National Defense.** See *History* below.

**Education and Religion.** Schooling is compulsory and there is practically no illiteracy. Of 761,287 children of school age (7 to 14 years) in 1936, 666,060 were attending elementary schools. In 1938-39 there were 36,560 students in government high schools and 12,855 in universities. The Lutheran Protestant Church, to which 6,124,490 persons adhered in 1930, is recognized as the State church. There were also 6653 Jews, 4763 Roman Catholics, 3981 Methodists, 805 Baptists, and 1499 others.

**Production.** Under normal conditions, approximately half the working population is engaged in agriculture and the remainder chiefly in fishing, lumbering, manufacturing, and commerce. The 1940 harvest was 20 per cent lower than the average for the period 1936-39, reducing agricultural income about 375,000,000 crowns below normal years. The 1939 harvest was valued at 1,228,000,000 crowns. Estimated yields of the chief crops in 1940 were (in metric tons): Wheat, 454,500; barley, 192,600; rye, 296,100; oats, 1,133,900; potatoes, 1,868,300 in 1939; beet sugar, 275,400 in 1939-40. Livestock statistics for 1939 were: 2,976,000 cattle, 1,316,000 swine, 373,000 sheep, 616,000 horses, and 50,000 goats. Production of the sea fisheries in 1938 was 124,200 metric tons, valued at 31,700,000 crowns. Wood pulp output in 1938 was 3,061,000 metric tons.

The major industrial products in 1938 (in metric tons unless otherwise specified) were: Iron ore, 8,500,000; pig iron, 714,000; steel (ingots and castings), 972,000 (1,200,000 in 1939); coal, 431,000; copper ore, 9300 (10,500 in 1939); zinc, 34,600; lead, 8600; aluminum, 1900; manganese, 2100; pyrites, 186,000; tungsten, 110; margarine, 59,000; wool and mohair, 600; rayon, 7961; silver, 35.1 in 1939; gold, 7300 kilograms in 1939; beer, 41,950,000 gal.; alcohol, 11,914,000 gal.; electricity, 8,150,000,000 kilowatt-hours; paper, 979,000 metric tons in 1937. Income from operations of the Swedish merchant marine was 416,000,000 crowns in 1939 (236,200,000 in 1938). Shipping tonnage launched in 1939, 94,000.

**Foreign Trade.** Merchandise imports in 1939 were valued at 2,489,000,000 crowns (2,081,700,000 in 1938) and exports at 1,879,000,000 (1,843,300,000 in 1938). Principal exports were iron and

steel, machinery, paper, wood, minerals. In 1938 the exports were distributed chiefly as follows (in crowns): Great Britain and Ireland, 446,915,000; Germany, 328,779,000; United States, 165,785,000; Norway, 124,927,000; Denmark, 87,883,000; Finland, 86,437,000. Of the imports (valued in crowns), Germany supplied 480,940,000; Great Britain and Ireland, 376,319,000; United States, 336,749,000; Denmark, 118,070,000; the Netherlands, 114,794,000. See *TRADE, FOREIGN*.

**Finance.** For the fiscal year ended June 30, 1940, there was an actual deficit of 924,000,000 crowns. Estimates for 1940-41 were: Ordinary receipts, 1,692,400,000 crowns; capital receipts, 306,700,000; ordinary expenditures, 1,456,700,000; capital expenditures, 306,700,000. A deficit of 1,700,000,000 crowns was anticipated. Public debt, 4,518,000,000 crowns on Dec. 31, 1940 (2,701,376,000 on Aug. 28, 1939). The Swedish crown (krona) averaged \$0.2399 in 1939 and \$0.2380 in 1940.

**Transportation.** Sweden in 1940 had about 10,381 miles of railways, over 53,000 miles of highways (see *ROADS AND STREETS*), and air lines connecting with the principal cities of northern Europe. The State railway lines in 1939 carried 12,508,450 metric tons of freight and 50,645,587 passengers as against 21,965,757 metric tons of freight and 36,967,667 passengers carried by the private lines. The State lines reported a surplus of 21,570,424 crowns; private lines, surplus of 15,292,884 crowns. The Swedish Air Lines in 1939 carried 48,029 passengers (46,845 in 1938). The merchant marine as of June 30, 1940, comprised 1310 steam and motor vessels of 1,503,426 gross tons, a net decrease of 1.9 per cent since the outbreak of the European War. War losses up to Dec. 30, 1940, totaled 79 vessels of 186,300 gross registered tons and 459 lives. A ship canal across the Falsterbo Peninsula to connect the Kattegat with the Baltic Sea was under construction in 1940.

**Government.** The Constitution of 1809, as subsequently amended, vested executive power in a hereditary King, acting under the advice of a Council of State (Cabinet), which is responsible to the Diet or Riksdag. The Upper Chamber of the Riksdag has 150 members, one-eighth of whom are elected annually by provincial and city councils; the Lower Chamber, 230 members, elected by direct male and female suffrage for four years. The coalition cabinet appointed Dec. 13, 1939, consisted of: Premier, Per Albin Hansson (Social Democrat); Justice, Prof. K. G. Westman (Agrarian); Foreign Affairs, Christian Guenther (Social Democrat); Defense, P. E. Sköld (Social Democrat); National Economy, G. H. Eriksson (Social Democrat); Communications, Gustaf Andersson (People's party); Finance, E. Wigforss (Social Democrat); Education, Gösta Bagge (Conservative); Agriculture, A. Pehrsson-Bramstorp (Agrarian); Commerce, J. F. Domö (Conservative); Social Affairs, F. Gustav Moeller (Social Democrat); Ministers without Portfolio, N. Quensel (Agrarian) and Thorwald Bergquist (People's party).

#### HISTORY

**Policy Toward Finland.** Despite vigorous criticism of its non-interventionist policies by former Foreign Minister Rickard Sandler and a substantial bloc of minority opinion, the Hansson Government clung to its careful "keep out of war" policy throughout 1940. It permitted some 10,000 Swedish volunteers to help the Finns in their brave

struggle against the Russian invaders (see *EUROPEAN WAR*) and encouraged the shipment of large military and non-military supplies from or through Sweden to Finland. But the government rejected Finland's despairing appeals for help from the Swedish army and air force. It refused to permit the passage of Allied troops across Sweden to aid Finland. With the support of King Gustaf, it rebuffed Sandler's appeal of January 17 to the Riksdag, urging the occupation of the Aland Islands by Swedish troops to forestall the establishment of a Soviet base.

When Finland was worsted in the unequal struggle with Russia, the Swedish Government served as the intermediary through which the onerous Finnish-Soviet peace of March 12 was concluded (see *FINLAND under History*). The Swedish people extended further extensive private aid to Finland for relief and reconstruction purposes when the Russo-Finnish war was ended. But the Hansson Government quickly dropped a proposal for a Finnish-Norwegian-Swedish mutual defense pact when Moscow expressed its opposition.

**German Invasion of Norway.** Sweden's "hands off" policy in the Russo-Finnish war was motivated by fear of a German attack and the consequent conversion of Scandinavia into a main theater of the European War. The same fear induced Stockholm to follow an identical policy of armed neutrality when Germany occupied Denmark and invaded Norway on April 9. See *DENMARK and NORWAY under History*.

On February 25 the Swedish, Norwegian, and Danish Foreign Ministers, meeting in Copenhagen, had agreed to "act as a unit" in safeguarding their neutrality (see *DENMARK under History*). But coincident with her attack upon Norway, Germany warned Sweden to avoid intervention and the Swedish Parliament agreed to preserve strict neutrality in a secret session on the night of April 9. A few days later Premier Hansson firmly rejected a German demand to use Swedish territory and the Swedish telephone and telegraph system to supply and communicate with German troops fighting in Norway. King Gustaf wrote Hitler personally that Sweden would defend her neutrality at all costs. Swedish armed forces were mobilized despite German assurances that Swedish neutrality would be respected. German airplanes that repeatedly flew over Swedish territory were fired upon. Elaborate precautions were taken against "fifth column" activities in Sweden.

**Results of Neutrality.** As a result of these policies, Sweden managed to stay out of the spreading European conflict during 1940. But with Norway and Denmark in German hands, Sweden was cut off from all economic and political contact with the Allied and neutral countries of Western Europe and the Americas. From both the military and economic point of view Sweden was at Berlin's mercy. At the same time Sweden's defenses against Russia were markedly weakened by Finland's defeat. There was ever-present danger that the Soviet Government would complete the conquest of Finland at the first favorable opportunity. Believing that Germany's defeat by the Allies would open the way to Soviet domination of the Continent, many Swedes were led to hope for a German victory.

The difficulties and dangers of Sweden's new position in Europe were brought home to her people with increasing force as the year advanced. Early in July the Swedish Government, over the protest of Great Britain, agreed to provide trans-

port facilities for war materials and unarmed German soldiers traveling between Germany and Norway. On July 9 Dr. Alfred Rosenberg, official German Nazi philosopher, announced the Reich's intention of taking all the Scandinavian peoples into the "greater Germanic unity of the North Sea and Baltic room," which would present "a common political and economic front toward the outside."

The German press adopted an increasingly threatening tone toward Sweden, warning that the Reich could not countenance "unfriendly" accounts of European events in Swedish newspapers. These incidents aroused indignation in Sweden. Premier Hansson on July 28 and other leading Swedes expressed the nation's determination to remain free and independent. But growing economic pressures forced the Swedes to readjust their economy and their national policies.

With its trade restricted to Germany, German-occupied territories, Finland, and the Soviet Union, the Swedes on July 12 concluded new trade agreements with the Reich and Norway based on the Nazi trade principles. Exchange rates and prices were fixed arbitrarily to Germany's advantage. Sweden undertook to sell the Reich greater quantities of paper, pulp, and lumber than Germany required, with the knowledge that the Germans would probably resell part of them to other countries in competition with Sweden. Moreover the Swedes were obligated to buy German luxury goods they did not need at prices fixed in Berlin.

These same principles were applied in a more comprehensive Swedish-German trade pact of December 16 and in trade agreements that the Reich Government concluded with Sweden on September 10 on behalf of Belgium and the Netherlands and in December on behalf of Denmark. Toward the end of September the Swedish Government yielded to German attacks upon the Swedish press. It confiscated three issues of a liberal newspaper that had expressed doubt as to the accuracy of official German reports concerning German air losses. Similar action was taken against a newspaper that printed accounts of alleged British terrorism in Iceland.

**Relations with Russia.** The Swedes sought to lessen this growing pressure from the Reich by establishing closer relations with the Soviet Union. After months of negotiation, Sweden on September 9 extended a 100,000,000-crown credit to Russia for the purchase of Swedish machine tools and signed another agreement for increased trade. Sweden agreed to purchase 75,000,000 crowns worth of Russian oil products, fodder, manganese ore, etc., annually while Moscow was to take 100,000,000 crowns worth of Swedish machinery and other steel manufactures. But the Stockholm authorities continued to watch Soviet activities in Finland and the Baltic States with deep uneasiness. On August 16, when a new Soviet attack upon the Finns seemed likely, Foreign Minister Guenther delivered a speech indicating that in this case Sweden might abandon neutrality and join forces with Finland. Beginning September 1 Sweden undertook to furnish Finland with 50,000,000 crowns worth of iron, steel, and other products for reconstruction purposes and to provide an additional credit of 25,000,000 crowns.

**Defense Preparations.** Throughout this trying period, the Swedish government and people worked feverishly to strengthen their defenses against attack from without and "fifth column" activities within. War industries operated at top

capacity to make good the shortages resulting from shipments of military supplies to Finland and to provide new defense equipment. The army general staff was reorganized March 21, with Maj. Gen. Iva Holmquist succeeding Lieut. Gen. Per Sylvan as Commander in Chief. More conscripts were called to the colors for extended training.

In May a Home Defense Corps of 50,000 men was established to deal with invasion by parachutists and troop-carrying airplanes. Defense organizations of various kinds were formed for all physically-fit Swedes over 16 years of age. On May 8 a 100-mile mine belt protecting the entrances to Stockholm and other ports was laid. On May 24 the government announced that the 1936 rearmament program, scheduled for completion in 1945-46, had been in the main "more than carried out." The Riksdag on April 17 approved a 685,000,000-crown defense budget for 1940-41 and authorized the government to exceed this sum if necessary. A defense loan of 500,000,000 crowns, launched May 1, was over-subscribed by August. On August 2 the Riksdag was called in extraordinary session to consider further emergency defense measures and increase defense appropriations. The defense program received a setback when 110 military planes ordered in the United States were requisitioned by the Washington Government on October 22. Subsequently about 32,000,000 crowns were appropriated for the construction of two cruisers and a number of destroyers and submarines.

**Economic Readjustments.** Closely related to the defense program were the measures taken to adjust Sweden to its new economic position. On February 24 Parliament imposed rigid restrictions on the export of capital and on dealings in gold and foreign exchange to check the flight of capital. A decree of January 31 revalued the gold holdings of the Riksbank at the daily market price of gold and placed all the bank's gold holdings in the reserve for the support of the currency.

Rationing of coal, coke, petroleum products, and certain other essentials was instituted immediately after the German invasion of Norway. A government price control board was established, and the scope of price control, like rationing, was progressively extended. Stocks of many staple commodities were expropriated by the government. Effective May 8, the government was authorized to proclaim a financial moratorium at its discretion. In June legislation was passed empowering the King in Council, the Riksbank, and other government organs to carry on at home or abroad in the event of war. Meanwhile the State assumed ever wider emergency powers, including control of foreign trade, shipping, and land transport. Income and many other taxes were drastically increased while non-essential State and municipal expenditures were curtailed.

Economic conditions became steadily more difficult. Foreign trade was halved. The belligerents sank or confiscated 85 Swedish vessels worth \$25,000,000 up to Sept. 1, 1940, and activities of the remaining merchant vessels were greatly curtailed. Prices continued to rise while national income declined. Industrial production fell (except in war industries) and unemployment was held in check only through expansion of the armed forces.

**National Elections.** The popularity of the government's course in the face of these difficulties was demonstrated in the quadrennial elections to the Riksdag held on September 15. The Social Democrats under the leadership of Premier Hans-

son won 19 additional seats, while the conservative Agrarians lost 8 seats and Socialists and Communists together lost almost half of their 1936 popular vote. The setback to the Communists was attributed to the Soviet attack upon Finland while the Socialists had shown pro-German tendencies. The standing of the parties in the new Riksdag, with the previous standing in parentheses, was: Social Democrats, 134 (115); Conservatives, 42 (44); Agrarians, 28 (36); People's party (Liberals), 23 (27); Communists, 3 (5); Socialists, 0 (3).

The unity of all political parties, except the Communists and the pro-Nazi National Swedish Union, in defending Sweden's independence and democratic institutions was shown at a joint demonstration of about 150,000 persons in Stockholm on May Day. Leaders of all the pro-democratic parties spoke from the same platform, appealing for national unity and mutual sacrifice. A bill to outlaw the Communist party, introduced by the Conservatives in January, failed to receive government support. At the convention of the pro-Nazi National Swedish Union early in October, Leader Sandström announced that because of the German occupation of Norway, the party was ready to make "a decisive contribution to Swedish national life." He indicated that the shortage of funds that previously handicapped the movement had been overcome.

See DENMARK, GERMANY, and GREAT BRITAIN under *History*; CO-OPERATIVE MOVEMENT; EUROPEAN WAR under *Finnish Campaign*; INDUSTRIAL CHEMISTRY; LABOR CONDITIONS; MUSIC.

**SWEDISH LITERATURE.** See SCANDINAVIAN LITERATURE.

**SWIMMING.** The shattering of four world's and many national records, a double victory by the University of Michigan in the national A.A.U. indoor and National Collegiate A.A. championships and the meteoric rise of a new aquatic marvel in the person of 15-year-old Miss Mary Mooreman Ryan of Louisville, Ky., were outstanding developments in the 1940 world of water sports.

Adolf Kiefer, representing the Chicago Towers Club, reduced his back-stroke marks for 100 yards from 0:58.8 to 0:58.1 and 100 meters from 1:04.8 to 1:04.7. The Yale varsity team of Richard Kelly, Edward Pope, Russell Duncan, and Howard Johnson cut the time for the 400-yard free style relay from 3:31.3 to 3:30.7, and then the three last-named and William Sanburn shaded the figures from 3:59.2 to 3:54.4 for the 400-meter relay. The 400-yard record was also shattered by Edward Hutchens, John Gillis, Charles Barker, and Gus Sharamet, all of Michigan, who traversed the course in 3:31.

The Wolverines captured the A.A.U. laurels by overpowering the Towers Club, 28 to 24, and the N.C.A.A. pennant by outpacing Yale, 45 to 42.

Miss Ryan reduced the American long course standards for 400 yards from 5:32.5 to 5:30.1, 880 yards from 11:33.2 to 11:26.4 and the one mile from 23:47.4 to 23:15, a mark not far removed from the world's record of 23:11.5.

Outstanding among the new records were long course marks of 2 13.1 for 220 yards free style by Otto Jaretz of the Towers Club; 9:17.3 for the 880-yard relay by members of the Alexander House C.A. of Hawaii and a 20-yard course standard of 1:01 for the 100 yards breast stroke by Richard Hough of the Princeton A.A.

Among the sensational marks set by women were 2:30.3 for 220 yards free style set by Miss

Brenda Helser of the Multnomah A.A.A. of Portland, Ore.; 1:24.2 for 100 meters breast stroke, by Miss Lorraine Fischer of the New York Women's S.A.; 220 yards in 3:09 by Miss Fujiki Katsutani of Hawaii, and 3:28.6 for the 300-yard medley relay by a New York W.S.A. trio. Besides these, there were long-course marks of 1:18.4 for 110 yards back stroke by Miss Gloria Callen of the latter club, and 4:45.7 for the 400-meter relay by Multnomah girls.

In springboard diving, Al Patnik of Ohio State University, was tops; in platform work, his teammate, Earl Clark, was without a peer. Miss Marjorie Gestring of Los Angeles captured both the outdoor women's crowns, defeating Miss Helen Crlenkovich of San Francisco, the indoor champion.

For the second successive year the Alexander House C.A. won the men's national A.A.U. team championship. In the college field, Michigan carried off the Big Ten honors, Yale was all-powerful in the East and Southern California was supreme on the Pacific Coast.

**SWITZERLAND.** A federated republic of central Europe. Capital, Bern (Berne).

**Area and Population.** Switzerland has an area of 15,944 square miles and a population estimated at 4,216,000 on Jan. 1, 1940 (4,066,400 at the 1930 census). The urban population in 1937 was estimated at 1,760,000. Living births in 1938 numbered 63,790 (15.2 per 1000); deaths, 48,576 (11.6 per 1000); marriages, 31,031 (7.4 per 1000). Estimated populations of the chief cities on Jan. 1, 1939, were: Zurich, 329,780; Basel, 162,559; Geneva, 123,286; Bern, 121,976; Lausanne, 89,632; St. Gallen, 63,491; Winterthur, 58,410; Lucerne, 54,123. The 1930 census showed 2,924,313 German-speaking Swiss; 831,097 French-speaking; 242,034 Italian-speaking; and 44,158 Romansch-speaking.

**National Defense.** All males from 18 years of age to 60 serve compulsorily in a national militia. The militia numbers about 480,000. An air force of some 5000 men and 400 aircraft is maintained. See also under *History*.

**Education and Religion.** The system of public education varies by cantons. In the academic year 1938-39, pupils in primary schools numbered 460,222; in secondary and special schools, about 90,000; the universities of Basel, Zurich, Bern, Geneva, Lausanne, Fribourg, and Neuchatel had among them 8854 students. Literacy is virtually universal among competent natives of according age. The census of 1930 reported 2,230,303 Protestants, 1,666,350 Roman Catholics, and 17,973 Jews.

**Production.** The census of 1930 showed 404,239 persons engaged in agriculture, 819,018 in manufacture and trades, and 164,989 in commerce. About 12 per cent of the land is arable; meadows cover some 4,161,000 acres; forests, 2,372,000. The chief agricultural products of 1939, in millions of Swiss francs, were: Milk, 451; cattle, 244; pigs, 167; fruit, 67; poultry products, 63; the value of all agricultural production of the year, 1,269. The industries included the making of cheese, condensed milk, watches and clocks, and embroidery.

**Foreign Trade.** Switzerland, before the war broke out in Europe in 1939, normally imported much of its requirement of cereals, fruits, vegetables, and mineral substances; it exported chiefly machinery, clocks and watches, and cotton textiles. Trade did not in most respects fall much out of normal for the calendar year 1939. Imports

amounted to 1,889,358,000 Swiss francs (for 1938, 1,606,902,000); exports, to 1,297,577,000 (for 1938, 1,316,572,000). Germany sent (1939) 440,240,000 francs of the imports and took 191,529,000 of the exports; France sent 275,344,000 and took 140,106,000; Italy sent 135,178,000, took 80,675,000; the United Kingdom sent 109,304,000, took 164,506,000; United States sent 132,685,000, took 129,678,000.

**Finance.** The Federal revenue of the fiscal year 1940 was estimated at 513,200,000 Swiss francs; expenditure, at 584,300,000; revenue of 1939, at 511,800,000; expenditure, at 600,700,000. The Federal public debt (not to count the debt of the Federally owned railways) included, Jan. 1, 1940, 2,237,575,000 Swiss francs bonded and 487,517,179 floating; total, 2,725,092,179; or, with railroad debt included, 5,841,396,529. The Swiss franc, the monetary unit, as quoted in U.S. money, averaged \$0.2268 in value in 1940.

**Transportation.** There were in 1937 about 3660 miles of railway (2800 miles electrified) and (in 1939) 10,448 miles of highways (see *ROADS AND STREETS*). Civil aviation statistics for 1938 were: Miles flown, 3,354,530; mail carried, 1,386,489 lb.; freight and baggage, 1,338,201 lb.

**Government.** The Constitution of 1874 provides a republican confederation of 22 cantons or States. The Federal Assembly consists of two chambers; one, the Council of States, is composed of 44 members—two from each canton; the other chamber, the National Council, has 187 members, all elected at four-year intervals by the obligatory vote of males who have attained 20 years of age. The Federal Council consists of seven members, all elected quadrennially by vote of the united chambers of the Federal Assembly; by similar vote, but annually, are chosen, from among the seven, a President of the Confederation and a Vice-President of the Federal Council. Each of the Federal Council's seven members is assigned to the direction of one of the seven Federal administrative departments. Dr. Marcel Pilet-Golaz was President in 1940.

### HISTORY

The totalitarian tide swept completely around Switzerland during 1940 and threatened momentarily to engulf the sturdy little democracy. But the Swiss held firm against the menace of invasion, the plotting of "fifth column" elements within, and the progressive strangling of their commerce which raised the specter of economic ruin and starvation. On the night of August 1 they celebrated the 649th anniversary of Swiss union and freedom by lighting bonfires on hundreds of mountain peaks and with torchlight and lantern parades in the cities. The nation's military and civil leaders pledged anew their determination to defend Swiss neutrality and independence at all costs.

**The May-June Crisis.** During the first four months of the year large Swiss forces stood on guard along the German frontier to repel a possible German invasion of France through Swiss territory. After the German attack on Norway and Denmark, 60,000 more men were called to the colors (April 18). With the beginning of Hitler's offensive against the Low Countries on May 10, full mobilization and a "precautionary state of war" were proclaimed.

For the next few weeks Switzerland lived in imminent danger of attack. Large German forces of tanks and troops were massed on the frontier and German airplanes repeatedly flew over Swiss

territory, a number being shot down by Swiss fighter planes. On May 14 the British and French legations in Berne burned their files in anticipation of a German invasion. On May 16 the Swiss-German frontier was closed. In mid-June, after Italy entered the war and German troops were sweeping around the rear of France's Maginot Line, the Swiss officials suddenly tightened all military precautions and warned the public of a possible parachute invasion. Nothing happened except the flight of about 60,000 French and Polish troops across the Franco-Swiss frontier in the last days of the fighting in France. On June 28 the crisis seemed over and partial demobilization of the Swiss armed forces of more than 400,000 men was ordered. Nevertheless large forces continued to man the frontier defenses throughout the rest of the year.

**Economic Isolation.** The entrance of Italy into the war and the collapse of France isolated Switzerland politically and economically from the democratic world and all non-European markets. The trade previously carried on in American ships touching Mediterranean ports was cut off. Some 20 Greek ships had been chartered by the Swiss Government in May to carry on Swiss trade through Genoa, Italy. But obstructions interposed by the British blockade and by Italian authorities hampered the ships' operations. Then the outbreak of the Italo-Greek war in October tied up the chartered vessels.

The railway through unoccupied France remained Switzerland's only connecting link with non-belligerent countries until the Evires railway bridge over the Rhone River was blown up early in September. It was over two months before the bridge was rebuilt and the railway reopened. Meanwhile the Swiss Government's effort to establish a motor-truck route across France and Spain to Portugal had to be abandoned for lack of gasoline.

**Pressure from Axis Powers.** Switzerland was thus left at the mercy of Germany and Italy economically. They seized the opportunity to press for acceptance of their "new order" in Europe. In order to obtain German coal, Switzerland was reported to have surrendered part of her gasoline stocks to the Reich. Late in August the Swiss Government dropped its ban on the admission of Chancellor Hitler's official newspaper, the *Voelkischer Beobachter*, imposed some years previously when Swiss papers were barred from Germany. Contrary to Swiss expectations, Germany retained its ban on Swiss newspapers and Nazis increased their demands that Switzerland end its "arrogant policy" and "find a new relationship" to the Reich.

From July on, the Italian press and radio likewise adopted a menacing tone toward Switzerland. They warned of "grave complications" unless the Bern authorities took a "more realistic attitude" toward the European political situation and curbed the alleged pro-British bias of the Swiss press. The Italians also threatened to intervene unless the Swiss Government prevented night flights of British bombers across Switzerland en route to and from Italy. The Swiss made repeated protests to London and received assurances that British pilots would be instructed to avoid Switzerland, but violations of Swiss air limits at night continued.

**Economic Measures.** To protect the republic's economic and financial position, the government concluded new trade and payments agreements with Germany, Italy, and some of the German-occupied countries on the best terms available. A special office was established April 27 for the more

thorough supervision of exports and imports. To prevent the freezing of Swiss capital in conquered territories, the government on July 8 assumed supervision over capital deposited in Switzerland from Belgium, the Netherlands, France, Denmark, Norway, and Luxemburg. It required all outgoing payments to those countries to clear through the National Bank. The price-control and rationing systems were extended. On October 4 the government took over the entire crop and all stores of bread grains. A week later the sale of butter to retailers was temporarily halted. A decree ending all sales of wool articles temporarily was issued October 31.

Meanwhile prices continued to rise and emergency defense costs imposed a severe strain upon the country's finances. In July the Federal Assembly adopted special emergency capital and income taxes for national defense. Effective Jan. 1, 1941, a capital tax was imposed ranging from a minimum of 5 francs annually on bank deposits and security holdings of 10,000 francs to 2500 francs on 1,000,000 francs. The supplementary income tax raised this form of taxation to a higher level than in most belligerent countries.

**Anti-Democratic Agitation.** The Swiss also experienced growing difficulty with anti-democratic minority groups, particularly pro-Nazi elements receiving financial aid and encouragement from Berlin. On February 29 Robert Tobler, head of the pro-Nazi Swiss National Front, was arrested on a charge of transmitting military information to Germany. A colonel attached to the War Ministry and six accomplices were arrested for German espionage April 21. On May 11 foreigners in possession of fire arms were ordered to turn them over to the police. A week later several hundred persons were arrested in a nation wide round-up of those who failed to comply.

An increase in Communist propaganda led the Federal Government on August 6 to ban all Stalinist, Trotskyist, and anarchist activity and propaganda under heavy penalties. The Swiss Communist party and all its branches and affiliated associations were ordered dissolved on November 27. The pro-Nazi Swiss Nationalist movement, led by Ernst Hofmann, became increasingly aggressive in its attacks upon the Swiss Government and democratic institutions after the collapse of France. On September 12 Hofmann and an associate issued a communiqué stating that they had been received by President Pilet-Golaz as the "first step toward political appeasement in Switzerland." This stirred up severe criticism of the President and he was obliged to explain his action before the chairmen of the Swiss political parties.

After arrests of Nazis secretly affiliated with the Nationalist movement and the banning of their organizations, Hofmann and four associates in a letter to President Pilet-Golaz on November 12 demanded assurances that the party would be allowed freedom of press and assembly, the "public rehabilitation" of its arrested members, and damages for members "hurt morally or economically" through police measures. The government responded with a decree of November 19 dissolving the Nationalist party, forbidding it to reorganize under another name, and banning its newspaper and all its propaganda and activities.

**Other Political Events.** In a referendum held December 1 the voters rejected, 429,952 to 342,838, a government bill making pre-military training obligatory for all youths from 16 to 19 years of age. The first referendum on woman suffrage, held

in one of the cantons the same date, resulted in an adverse vote of 17,120 to 7819.

The resignations of two members of the Federal Council, War Minister Rudolf Minger and Minister of Justice and Police Johannes Baumann, lent unusual importance to the parliamentary session of December 10, at which two new Federal Councillors and a President were elected. Ernest Wetter of the conservative Radical-Democratic party was elected President for 1941, while Edouard von Steiger of the Farmers, Workers, and Middle Class party and Karl Kobelt, an Independent, were chosen for the vacancies on the Federal Council.

See GERMANY under *History*; LABOR CONDITIONS; MUSIC.

**SYNTHETIC PRODUCTS.** See CHEMISTRY, INDUSTRIAL; MINERALOGY; NATIONAL DEFENSE ADVISORY COMMISSION; RUBBER.

**SYRIA AND LEBANON.** A territory on the east coast of the Mediterranean between Turkey and Palestine, mandated to France by the League of Nations on July 24, 1922. Administrative center of the French High Commissioner, Beyrouth (Beirut).

**Area and Population.** The area and population of the Syrian Republic, its sub-divisions, and the Republic of Lebanon, are shown in the accompanying table. It excludes the Sanjak of Alexandretta (Hatay Republic), with an area of 1930 square miles (pop. about 228,000), ceded to Turkey by France June 23, 1939.

SYRIA AND LEBANON—AREA AND POPULATION

<i>Political Unit (Capital)</i>	<i>Area, sq. mi. *</i>	<i>Population<sup>b</sup></i>
Republic of Syria (Damascus)	72,560	2,487,000
Syria Proper (Damascus) ...	67,550	2,044,000
Latakia (Latakia)	2,310	372,000
Djebel Druse (El Suweideh)	2,700	71,000
Republic of Lebanon (Beyrouth)	3,470	862,600
Total . . . .	76,030	3,349,600

\* Approximate. <sup>b</sup> Estimates of December, 1938, for the Republic of Syria and its subdivisions, census of 1935 for Republic of Lebanon. \* Excluding about 15,000 nomads who spend part of their time in Djebel Druse

The people are mainly Arabs and Arabic is the chief language, but there are considerable numbers of Turks, Kurds, Turkomans, Circassians, Armenians, Iranians, and Jews as well as about 28,000 Europeans. The chief cities, with 1935 populations, are: Damascus, 193,912; Aleppo, 177,313; Beyrouth, 134,655; Homs, 52,792.

**Education and Religion.** Statistics on education (1937): Primary, 2611 schools (253,763 pupils); technical, 146 (15,916); secondary, 31 (1485); universities, 3 (1316). Religions: Moslems, 1,514,755; Christians, 505,419; Alawites, 27,930; Druses, 86,125; Jews, 16,526; Ismailians, 14,882.

**Production.** Agriculture and livestock raising are the main occupations. Production (in metric tons): Wheat, 607,000 in 1939; barley, 370,000 in 1939; oats, 5400 in 1939; corn, 27,500 in 1938; rice, 3000 in 1938; potatoes, 41,600 in 1938; tobacco, 3400 in 1938; cotton-seed, 17,600 in 1938; cotton, 8400 in 1938; sesamum, 5300 in 1938; olive oil, 15,300 in 1938; hemp, 4760 in 1937; wool, 4400 in 1940. Livestock (Jan. 1, 1938): 2,273,520 sheep, 89,900 camels, 345,228 cattle, 152,221 asses, 1,659,514 goats. Some flour, soap, silk thread, etc., is manufactured.

**Foreign Trade.** Including transit trade, merchandise imports in 1938 were equivalent to \$283,200,000 (old U.S. gold dollars) and exports to

\$117,600,000. Trade is mainly with France, Great Britain, the United States, and neighboring countries in normal times; in 1940 it was reduced to a fraction of its normal value by the war.

**Finance.** Syria and Lebanon have separate budgets and also a "common interests" budget covering Customs, posts and telegraphs, etc. Actual receipts of the "common interests" budget declined from 12,237,189 Syrian pounds in 1938 to 7,742,500 in 1939. Budget estimates of the Syrian Republic for 1940 were 11,746,000 Syrian pounds; of the Lebanese Republic, about 6,500,000 Syrian pounds (6,369,000 in 1939). The Syrian pound (equal to 20 French francs), exchanged at \$0.576 in 1938 and \$0.0502 in 1939.

**Communications.** Syria and Lebanon in 1939 had about 890 miles of railway line, 7072 miles of roads, and bus connections between Beyrouth and Baghdad (Iraq). Air connections with France were severed in 1940. Beyrouth is the chief port.

**Government.** The French High Commissioner in July, 1939, suspended the Constitutions of the Syrian and Lebanese Republics and appointed councils to rule under his direction (see 1939 YEAR BOOK, p. 748-749). Latakia and Djebel Druse, which were semi-autonomous districts of the Syrian Republic, continued to be administered by French governors, assisted by partly nominated and partly elected councils. See *History* for 1940 developments.

## HISTORY

**Syria Accepts Armistice.** The capitulation of the Pétain Government in France to Germany on June 22, 1940, and to Italy on June 24 threw Syria and Lebanon into great political confusion and severe economic difficulties. Throughout the first half of the year, Gen. Maxime Weygand, commander of the French forces in Syria and Lebanon, continued to strengthen and train his army of several hundred thousand men, concentrated in the Near East to reinforce the British in Egypt and the Turks. The presence of this army, combined with native preference for an Anglo-French victory, curbed the nationalist ferment that had caused the suspension of the Syrian and Lebanese constitutions in 1939.

On May 19 General Weygand returned to France to take command of the hard-pressed French armies, and it was at his recommendation that Marshal Pétain asked the Germans for an armistice. The Italo-French armistice of June 24 provided for the demobilization and disarmament of all French forces in Syria except those needed to maintain order within the territory. Gen. Eugene Mittelhauser, who had succeeded Weygand as commander of the Near Eastern forces early in June, had declared in a radio speech of June 23 that his army would continue the war. Most of his officers were reported to favor this course. But a personal message from Weygand caused Mittelhauser to change his mind. On June 27, with the approval of High Commissioner Gabriel Puaux, he announced the cessation of hostilities. The French flag, he said, would continue to fly over the mandated territory.

**Political Tensions.** The cessation of hostilities and the adherence of the highest French officials in Syria to the Pétain regime divided the French army and civilian officials in Syria, revived the native independence movement, subjected the territory to the British blockade, and made it a center of the Near Eastern struggle between Britain and her allies on the one hand and the Axis

powers on the other. General Mittelhauser, who seemed lukewarm in his support of the Pétain Government, permitted many of his own officers and troops as well as the Polish and Czech contingents in Syria to cross into Palestine to join the British. He was replaced in mid-July by General Fougère. The French officers, soldiers, and civilians who remained in Syria and Lebanon were divided into three groups—those supporting the Pétain regime, those urging that the territory throw in its lot with the British empire or else support the Syrian independence movement, and those wishing to return to their families in France and abandon Syria to its fate.

Great Britain, Turkey, the independent Arab countries, and the native nationalists of Syria and Lebanon all feared that the Axis powers, acting through the Pétain regime, would seek to use Syria and Lebanon as a base for the subjugation of all Asia Minor. On July 1 the British Government announced that it "could not allow Syria or the Lebanon to be occupied by any hostile power or to be used as a base for attacks upon those countries in the Middle East which (it was) pledged to defend, or to become the scene of such disorder as to constitute a danger to those countries." Unofficially the Turks took a similar position. The Syrian nationalists, supported by the Arab States, renewed their agitation for independence. After a visit to Ankara, the Iraqi Foreign Minister on July 5 declared that Iraq and Turkey favored Syria's complete independence from France.

In carrying out the demobilization of the army, the pro-Pétain administration at Beyrouth disarmed first of all those Syrian and French units whose political reliability was suspected. In mid-July the leaders of the Syrian nationalist movement were removed to Beyrouth from Damascus and placed under police observation. The situation became more explosive with the arrival in Beyrouth late in August of an Italian military mission to supervise demobilization under the terms of the Franco-Italian armistice pact. British resistance to the German *blitzkrieg* had strengthened anti-Pétain sentiment in French circles in Syria and the sweeping demands made by the Italian military mission intensified the opposition of both French and Syrians. These demands were said to have included delivery to Italy of all airdromes and military and naval bases, repatriation to France of officers hostile toward the Axis, and Italian control of travel, communications, the censorship, production, foreign trade, and of the munitions and supplies of the French army in Syria and Lebanon.

High Commissioner Puaux and General Fougère resisted the Italian demands. Mussolini subsequently replaced the original mission with a mixed commission of army officers and diplomats, but they achieved no better results. To allay Turkish suspicions of the Italian activities in Syria, the French chargé d'affaires in Ankara on September 18 gave formal assurances that the Pétain Government would not abandon any military position that would endanger Syria's security.

Finding it increasingly difficult to maintain order, the French administration late in September began large-scale arrests of Syrian nationalists and supporters of the "Free French" movement. The censorship was tightened and residents in the mandated territory were forbidden to listen to foreign news broadcasts. On orders from Vichy, the High Commissioner on October 22 issued decrees barring Jews from positions in the government services, State enterprises, and the newspaper, radio, and motion picture professions. At the demand

of the armistice commission, the government in November also barred exit visas to some 3000 Greeks desirous of returning to Greece for service against Italy.

During November and December, news of Italian reverses in Greece, the Mediterranean, and Egypt (see *EUROPEAN WAR*) further strengthened the agitation in Syria and Lebanon against the Italian armistice commission and the Vichy Government. High Commissioner Puaux attempted to calm the fears aroused in Vichy by this development. In a radio address on November 20 he declared that the French in Syria recognized Marshal Pétain as their leader and that the French army would fight only in self-defense. Effective November 30, heavy penalties were imposed on cities and villages whose inhabitants volunteered for service in foreign (i.e., British and Greek) armies.

Nevertheless M. Puaux had ventured to criticize some of the Vichy Government's policies and it was decided that a more loyal and sterner hand was needed to curb pro-British sentiment. On November 25 Marshal Pétain appointed Jean Chiappe, former prefect of the Paris police, to replace M. Puaux as High Commissioner. Chiappe was killed on November 27 when the plane carrying him to Syria crashed in the Mediterranean. A French communiqué affirmed, and British sources denied, that the plane was shot down by a British pursuit plane. The Vichy Government then appointed Gen. Henri Dentz as High Commissioner to Syria and commander-in-chief of the French military forces there (December 9). He was placed under the direct command of Gen. Maxime Weygand, French pro-consul in North Africa.

**Economic Conditions.** The growth of pro-British and Syrian nationalist sentiment was linked to the rapid deterioration of the economic situation in Syria and Lebanon following acceptance of the armistice. Through British influence Syrian trade with Palestine and Egypt was cut off and on July 6 the flow of oil through the pipeline from Kirkuk, Iraq, to the port of Tripoli was stopped. All sea communications with France, Italy, and the Western Mediterranean were ended. With French gold reserves in foreign hands and Syrian gold and foreign exchange reserves depleted, the government was obliged to resort to inflation of the currency to pay the armed forces and meet other obligations.

The currency depreciated rapidly and in spite of government efforts to fix prices, ration supplies, and curb profiteering, economic and financial conditions became rapidly worse. Prices soared, hoarding became widespread, truck and automobile transportation was severely restricted, and internal and external trade came to a virtual standstill.

See *EUROPEAN WAR* under *Effects of the Fall of France*; FRANCE, IRAQ, PALESTINE, and TURKEY under *History*.

**TACOMA NARROWS BRIDGE.** See BRIDGES; INSURANCE.

**TAHITI.** See FRANCE under *Colonial Empire*.

**TAIWAN.** See FORMOSA.

**TAJIK SOVIET SOCIALIST REPUBLIC.** See UNION OF SOVIET SOCIALIST REPUBLICS under *Area and Population*.

**TANGANYIKA TERRITORY.** The former German East African area now administered by Great Britain under a League of Nations mandate. Area, 363,600 square miles; population (1938), 5,260,484, including 9167 Europeans and 33,974 Asiatics. Capital, Dar-es-Salaam, 33,147 in-

habitants. Tanga, Lindi, Mikindani, and Kilwa are important seaports.

**Production and Trade.** Chief agricultural crops: coffee, cotton, groundnuts, sesame, cottonseed, copra, and sisal. Other important products included simsim, ghee, hides and skins, gold, diamonds, and timber (pencil cedar, camphor, mahogany, ebony, etc.). Livestock (1938): 5,052,207 cattle, 1,648,384 sheep, 2,827,766 goats. Trade (1939): imports, £3,039,673; expenditure, £4,585,658, including gold (187,254 oz.) valued at £980,346. In 1939 there were 1376 route miles of railway line.

**Government.** Budget (1940): estimated revenue, £2,126,000; estimated expenditure, £2,452,000. Tanganyika is under the administration of a governor, assisted by an executive council of 10 nominated members. There is a legislative council consisting of 13 official members and not more than 10 non-official members. Governor and Commander-in-Chief, Sir M. A. Young.

**History.** Troops from Tanganyika participated in the campaign along the Kenya-Italian East Africa border following Italy's entrance into the war (see EUROPEAN WAR under *Campaigns in Africa*). New defense forces were raised following the collapse of France and the majority of male Germans in the mandated territory, who had been paroled, were again interned. In August the Legislative Council unanimously approved the conscription of all male British and British-protected persons from 18 to 45 years of age for military or civil service. The war brought Tanganyika into still closer economic and political relations with Kenya and Uganda, reviving the campaign for unification of the three territories. Early in March a delegation from Tanganyika arrived in London to seek British aid in the marketing of the territory's products. Also see KENYA under *History*.

**TANGIER.** A former internationalized district in northwestern Africa, including the port and city of Tangier, occupying part of the southern shore of the Strait of Gibraltar. It was occupied by Spanish troops on June 14, 1940, and was formally incorporated in Spanish Morocco on November 23 (see *History*). Area, about 225 square miles; estimated population on Jan. 1, 1938, 80,000—mostly Moslems but including some 17,000 Europeans and 7000 Jews. The city of Tangier had about 45,000 inhabitants.

Commerce, agriculture, fishing, and cigarette-making are the chief occupations. Leading crops are wheat, barley, and chickpeas. Imports in 1938 were valued at 94,693,830 French francs; exports, 11,380,286 francs. A French-controlled railway connects the city of Tangier with Fez, French Morocco, and with the French North African railway network. Highways and roads extend about 65 miles. The Tangier port works were in process of modernization in 1940.

Tangier was neutralized and demilitarized by the convention signed by Spain, France, and Great Britain on Dec. 18, 1923. This statute was modified by a protocol signed at Paris July 25, 1928, at which time Italy also adhered to the convention. The convention was concluded for a period of 12 years and was automatically renewed for a similar period from May 14, 1936. It set up an autonomous regime in Tangier, with legislative powers exercised by an international assembly of 27 members. The assembly delegated administrative powers to an administrator. A committee of control, composed of the consuls of the powers adhering to the Tangier Convention, had veto and certain other powers. The Sultan of Morocco was repre-

sented by a Mendoub, who served as ex officio president of the assembly and controlled the administration of native affairs. The 1939 budget provided for revenues of 29,795,500 French francs and expenditures of 29,653,312 francs. Administrator Le Fur (French) was succeeded by Dr. Emanuel Amieva (Spanish) at the end of July.

**History.** The entrance of Italy into the European War on June 10, 1940, and the subsequent collapse of France enabled the Nationalist Government of Spain to seize control of Tangier without opposition by either Britain or France. In 1939 a Spanish threat to occupy Tangier had been met by Anglo-French naval concentrations at Gibraltar (see YEAR BOOK, 1939, p. 750). On June 14, 1940, some 3500 Spanish troops marched unhindered into Tangier. On the same day Madrid announced that "with the object of guaranteeing the neutrality of the international zone and the city of Tangier, the Spanish Government has decided to take charge provisionally of the surveillance, police, and public safety services of the international zone."

While the Franco Government declared this action was taken in agreement with Britain, France, and Italy, German sources and the Spanish press asserted that Britain and France were not consulted until after they were presented with a *fait accompli*. Madrid officials assured both Britain and France that the international administration of the Tangier Zone would be continued and the rights of interested powers respected. However the commander of the Spanish forces in Tangier, Col. Antonio Yuste, on November 3 made the Spanish peseta legal tender. The following day he abolished the International Assembly, the International Committee of Control and the Mixed Office of Information. At the same time he assumed the post of Military Governor of Tangier, representing the High Commissioner of Spanish Morocco. On November 9 Colonel Yuste abolished the international gendarmerie, replacing them with native troops under Spanish officers as in Spanish Morocco. The incorporation of Tangier in Spanish Morocco was completed November 23 when the cabinet in Madrid approved legislation to that effect.

Great Britain and the United States made formal representations to the Madrid Government concerning Spain's violation of the Tangier Statute, and reserved their rights. The British Government was reported in December to have reached an agreement with Madrid safeguarding the important British interests in Tangier. Spanish forces in the occupied zone were strengthened during the last months of the year, but allegations that the zone was being fortified with Axis aid were discounted by the British Under-Secretary for Foreign Affairs in the House of Commons on December 11. The British Government also took an active interest in two damaged Italian submarines which took refuge in Tangier harbor during November.

The Spanish military occupation was followed by an acute food shortage, which added to the resentment of both natives and foreigners against the Spaniards. See SPAIN under *History*.

**TARIFF COMMISSION, U.S.** The U.S. Tariff Commission is an independent fact-finding body created by Act of Congress in 1916. The provisions of that Act as it related to the Tariff Commission were re-enacted and extended to include the so-called flexible provisions in the Tariff Act of 1922. With minor modifications these pro-

visions were again re-enacted in Sections 330 to 338 of the Tariff Act of 1930, which is the present tariff law. The law provides that not more than three of the six commissioners may be of the same political party. The work of the Commission consists principally of general investigations and reports under Section 332 of the Tariff Act of 1930; co-operation with the Government departments under Section 334; cost studies under Section 336—the so-called flexible provisions—for the purpose of adjusting tariff rates; investigations under Section 337 to determine if unfair competition exists in the importation of goods or the sale of imported merchandise and the effect of such competition on domestic industry; and investigations under Section 338 to ascertain if other nations are discriminating against the commerce of the United States.

During 1940 the Tariff Commission issued a report on war and its effect on imports, which compared the imports during the first year of the war with the trade in earlier periods. In this and other work done during the year the Commission has co-operated closely with the National Defense Commission.

In view of the current interest in a definite policy of Western Hemisphere defense, the Commission has in progress a study of the foreign trade of Latin America. When completed the series will consist of 23 volumes. Many of these have already been issued. A Spanish translation of part I of the report, which deals with the trade of Latin America as a whole, was made for the use at the Habana Conference. As a further means of adapting its activities to current needs, the Commission has also prepared a Graphic Analysis of the Foreign Trade of Latin America and a Reference Manual of Latin American Commercial Treaties.

An investigation of the needlework industry of Puerto Rico was instituted by the Commission in November, 1940, at the request of the Administrator of the Wage and Hour Division of the Department of Labor. The purpose is to determine what if any changes in rates of duty are necessary in order to maintain minimum wage rates in Puerto Rico.

In addition to the activities set forth above the Commission has made a study of Italian commercial policy and foreign trade, and has under way analyses of recent trade policies of Germany, Japan, and other foreign countries.

As part of a program to issue commodity surveys of products that are important from a tariff view point, the Commission issued three reports during 1940. The survey respecting *silverware* shows the United States to be the world's leading producer and consumer of silverware as well as an important market for certain types of foreign-made goods. *Starches and dextrines* were the subjects of another of these surveys printed during the past year. The report deals with production, distribution, trade and uses of various of these products, and the degree of competition existing among them, including the competition between tapioca and domestic starch. In the survey concerning *glues, gelatins, and related products*, recently issued, it is shown that the United States has become self-sufficient in the production of practically all of these products.

Cost investigations were undertaken during 1940 with respect to the differences in costs of production of domestic and foreign crab meat and of certain types of embroidered and unembroidered wool-knit gloves and mittens. Upon completion of these investigations, reports will be sent to the President

and if the findings of the Commission warrant, the President will issue proclamations changing the rates of duty on imports of these articles as provided for in the Tariff Act of 1930.

As provided for in Sections 337 and 338 of the present tariff law consideration was given to alleged unfair methods of competition in the importation and sale of certain commodities, and every effort has been made to keep advised regarding acts of foreign countries which might be considered discriminating against foreign trade of the United States.

The Commission, under the provisions of Section 350, works in close co-operation with other Government agencies concerned with the trade agreements program. Considerable information was supplied to the committees of Congress when the extension of the Trade Agreements Act was under consideration early in 1940.

Under other special provisions the Commission has done work during the past year on investigations concerning wheat and wheat products and cotton and cotton products and has issued a large amount of material concerning trade agreements and other phases of the tariff problem. A list of these and earlier reports of the Tariff Commission is available upon request.

RAYMOND B. STEVENS.

**TARIFFS.** See CUSTOMS, BUREAU OF; TARIFF COMMISSION, U.S.

**TASMANIA.** An Australian State. Area, 26,215 square miles; population (Mar. 31, 1940), 239,574, exclusive of full-blood aboriginals. Vital statistics (1939): 5004 births, 2426 deaths, 2264 marriages. Chief cities: Hobart (capital) and suburbs, 65,450 inhabitants (Dec. 31, 1939); Launceston and suburbs, 33,350.

**Production.** Chief agricultural products: Wheat, oats, peas, fruits, potatoes, hops, hay. In 1939 the State had 2,500,000 sheep. Wool (as in the grease) output (1940): 18,000,000 lb. Dairy products (1938-39): 11,835,500 lb. of butter, 3,399,626 lb. of cheese, 2,273,601 lb. of bacon and ham. Mineral production (1938) was valued at £1,889,804 of which copper accounted for £580,238, zinc for £356,452, tin for £244,037, and gold for £195,071. Manufacturing (1938-39): 944 factories, 13,802 employees, £5,398,659 net value of production.

**Government.** Finance (1939-40): Revenue, £3,055,000; expenditure, £3,053,000; public debt, £27,244,000. The executive authority is vested in a governor, aided by an executive council of responsible ministers who are members of parliament. There is a legislative council of 18 members elected for a 6-year term, and a house of assembly of 30 members elected by proportional representation for a 3-year term. Governor, Sir Ernest Clark (term extended to Aug. 5, 1942); Premier, R. Cosgrove (Labor). See AUSTRALIA.

**TAXATION.** The increase in national defense outlays from \$1,579,000,000 in the fiscal year ended June 30, 1940, to an estimated \$10,811,000,000 for the fiscal year beginning July 1, 1941, brought about drastic changes in the tax structure. The Federal Government adopted the policy of increasing current taxation sufficiently to cover the non-defense costs of the government and the maintenance, as distinct from the expansion, of the Army and Navy. This end was sought through increases in tax rates that would not go so far as to cause a curtailment of consumption. Larger revenues were to be raised for the Treasury from an increase in national income, rather than the diversion of any

major part of the existing national income to finance the cost of armament. The President warned, however, in his budget message to Congress early in January, 1941, that, at a later stage of the defense program, when full national productive capacity would be approached, sharp increases in taxes might be sought to curtail consumption, so as to avoid inflationary price increases at that time. The new tax legislation enacted in 1940, therefore, did not constitute a full wartime tax program, but rather an initial step in that direction, with equal reliance placed upon larger yields from existing taxes.

At the same time, the Administration sought through taxation to prevent the evolution of "a new crop of war millionaires." This objective was pursued apart from the desire to raise additional revenues or to limit consumption.

**Federal Taxation.** Two major revenue acts were passed during 1940. The first Revenue Act of 1940, which became law on June 25, effected a number of tax increases to finance national defense. The new defense taxes were designed specifically to provide funds for repayment of special defense obligations up to a maximum of \$4,000,000,000 that the Treasury was authorized to issue, over and above the national debt limit of \$45,000,000,000 then in effect.

The law raised the corporate income tax rate from 18 to 19 per cent, and effected a number of increases in personal income surtax rates. The personal income tax exemption was reduced from \$1000 to \$800 for single persons, and from \$2500 to \$2000 for married persons or heads of families. Title II of the act imposed for a period of five years, for the financing of defense, an increase of 10 per cent in income taxes, the corporate excess profits-capital stock tax, the estate and gift tax, and a wide variety of excise taxes. The impost on distilled spirits was raised from \$2.25 to \$3 a gal., and on still wines from 5-25¢ to 6-30¢ a gal. See ALCOHOLIC LIQUORS.

The second Revenue Act of 1940, enacted October 8, effected even more sweeping changes in Federal taxation. The normal income tax rate for all but small corporations was increased from 20.9 per cent, including the defense tax, to 24 per cent. With the approval of the national defense authorities, taxpayers were authorized to amortize within a five-year period new productive facilities certified as acquired for national defense purposes. This assured that investments made to facilitate the filling of defense contracts could be written off against profits earned from such contracts within the period when such contracts were expected to be forthcoming. The limitation of 10 per cent on profits from naval contracts, contained in the Vinson Act, was suspended. The most revolutionary feature of the act, however, was the imposition of a new excess profits tax, similar to the war profits tax of twenty years earlier, to carry out the announced objective of the Administration to prevent abnormal profits from armament contracts.

The Excess Profits Tax of 1940 is applicable to corporations, with such minor exceptions as mutual investment companies, foreign personal holding companies, registered diversified investment companies, and aviation companies whose income is zero after deducting United States mail contract income. All corporations subject to the tax are required to pay, in addition to the normal tax, a graduated excess profits tax on earnings over and above the excess profits tax credit. The cor-

poration has the option of using as an excess profits tax credit either 95 per cent of its average earnings during the base period 1936-39 or 8 per cent of its invested capital. A number of adjustments are outlined in the law for the determination of the amount of income subject to the excess profits tax, and only 50 per cent of the borrowed invested capital may be included in determining invested capital. Upon the adjusted excess profits net income, however computed, the rates imposed are as follows:

First \$20,000.. . . .	25 per cent
Next 30,000 .. . . .	30 " "
Next 50,000 .. . . .	35 " "
Next 150,000 .. . . .	40 " "
Next 250,000 .. . . .	45 " "
Above 500,000 .. . . .	50 " "

General provision was made for relief by administrative authorities for "hardship cases," and it was stated at the time that the law was passed that amendments to remedy inequities would be passed, applicable to 1940 returns. These amendments were adopted by Congress in March, 1941. It was widely recognized that the excess profits tax failed to reach the added income of many corporations receiving defense contracts, whereas it imposed substantial added burdens upon other corporations which did not benefit from defense in any way, but which did have sharp increases in earnings over the 1936-39 level and had a relatively low invested capital as defined by the law.

The yields from Federal income taxes for the fiscal years ended June 30, 1939 and 1940 compared as follows:

FEDERAL INCOME TAX RECEIPTS  
[Fiscal Years Ended June 30]

	1939	1940
Corporation Taxes	\$1,122,540,800 61	\$1,120,581,550 75
Individual Taxes . . .	1,028,833,796 49	982,017,376 17
Total Income Taxes . .	2,151,374,597 10	2,102,598,926 92

**State Taxation.** Tax collections of the States were little changed from the previous year. The enormous increase in Federal expenditures under the defense program, and the consequent upturn in business activity, tended to increase State and local revenues, whereas there was no corresponding expansion in outlays of these governmental bodies. Rather, relief burdens tended to decline.

Among the more important developments in State and local taxation were the repeal of the Louisiana sales tax and of the New York City tax on cigarettes. South Carolina repealed her tax on intangibles. New taxes adopted during the year included a gift and a timber severance tax in Louisiana, pari-mutuel betting taxes in New York and New Jersey, chain store taxes on the number of stores wherever located in Kentucky and Mississippi, Diesel fuel taxes in Alabama, Louisiana, South Carolina, and Virginia, and cigarette taxes in Denver and Kansas City. Virginia adopted a measure requiring motor carriers traversing the State to purchase in Virginia an amount of gasoline equal to that consumed during the transit, in order to protect the revenue from that impost.

State liquor taxes were raised in two instances, in Kentucky from \$1.04 to \$1.20 and in Louisiana from \$1.00 to \$1.50. As a result, the average State tax on distilled spirits was increased from 96 to 98 cents a gal., and the combined Federal and State levies from an average of \$3.21 to \$3.98 a gal. The fear was expressed by the industry that

bootlegging would be stimulated by sharp increases in liquor taxation.

#### TAXONOMY. See ZOOLOGY.

**TELEGRAPHY.** Out of four years of court proceedings under bankruptcy laws, Postal Telegraph, Inc., was set up as an independent United States land-line system, under the terms of reorganization of the Postal Telegraph & Cable Corp., and obtained a \$500,000 RFC loan for plant improvements and other corporate purposes. Since 1929, Postal has been a part of International Telegraph and Telephone Corporation's "international system," the remaining portions of which have been consolidated under two separate companies—All-America Corporation, and Commercial MacKay Corporation—all the equity of which is held by a third new organization, American Cable & Radio Corporation.

The new 5600-mile telegraph and telephone line between Moscow and Kharbarovsk, U.S.S.R., is said to be the longest line in the world and to provide for 19 duplex telegraph transmissions, 7 telephone conversations, and the transmission of photographs and radio programs.

International facilities placed in service during the year include a radio telegraph and short-wave station at Portland, Ore., for trans-Pacific service, a radio-photo circuit between San Francisco and Tokyo, and new circuits between New York City and the French Island of St. Pierre off Newfoundland, Finland, Barcelona, and the Belgian Congo.

Under war conditions in Europe and Asia and consequent world unrest and suspicion, communications abroad are hampered in degrees varying from code or language restrictions to direct censorship of individual messages.

Electromagnetic "storms" of unusual severity disrupted telegraph, cable, and radio communications throughout the world on Easter Sunday, March 24, and, to a lesser degree, subsequently. So severe were the storms that even teletypewriter services and electric power systems were affected. In the United States the disturbances centered in the metallic-ore-bearing regions adjacent to Lake Superior where ground-potential differences of as much as 750 volts were noted between different points.

An electric calculating machine capable of carrying out computations in "complex" numbers was built at Bell Telephone Laboratories in New York City. The machine is constructed entirely of standard telephone apparatus—relays, crossbar switching equipment, etc.—and may be operated from remote points over telegraph circuits through the medium of teletypewriter equipment. Improved voice-frequency carrier telegraph systems announced provide for up to 18 telegraph channels over a four-wire line, some capable of extension up to 22 channels.

Teletypewriter exchange service continued to expand. New "automatic concentrators" at strategic points enable groups of as many as 100 outlying subscribers to be handled over a small number of trunk lines out of the exchanges to "concentrator points," as compared with the previous requirement of an individual exchange line for each teletypewriter subscriber.

Statistics show that as of Jan. 1, 1939, the 6,730,500 miles of telegraph wire in operation throughout the world was distributed as follows: United States, 34.17 per cent; remainder of North America, 7.72; Europe, 33.39; Asia, 13.74; Africa, 3.08; Oceania, 2.41; South America, 5.49 per cent. See CIVILIAN CONSERVATION CORPS; FEDERAL COMMUNICATIONS COMMISSION.

G. ROSS HENNINGER.

**TELEPHONY.** National Defense activities resulted in abnormal expansion of telephone facilities in the United States, largely by causing normal developments originally programed for as far as 1943 to be initiated during 1940. New construction expenditures were reported as some \$400,000,000, the largest amount since 1931. A total of 21,870,000 telephones was estimated to be in service in the United States, an increase of about 1,040,000 over 1939, as compared with the increase of 878,000 for 1939 over 1938, and an all-time record increase for a single year. Telephone conversations during 1940 averaged 97,700,000 per day, about 6,000,000 more than in 1939. Completed toll calls totalled some 1,030,000,000, about 40,000,000 more than in 1939. The number of dial telephones on the Bell System increased by about 1,250,000.

Jan. 25, 1940, was the 25th anniversary of the opening of the first transcontinental telephone line to commercial operation. Now, there are four such lines, and modern carrier equipment added to them has greatly multiplied the number of communication channels provided by each. During 1940 the capacity of many important routes was increased by the further application of new carrier equipment on existing lines and by many new intercity cables, most of which were laid along new or "alternate" routes so that a storm or disaster in any one place would affect as little as possible the dependability of through service.

By the end of 1940 more than 70 per cent of the circuit-mileage used for toll service was in cable. The cable network extends over the Northeast, with branches as far south as Atlanta and as far west as Omaha and Dallas. One \$1,000,000 1940 project is the new underground cable between Baltimore and Washington which, in addition to ordinary wire conductors, carries four co-axial circuits and provides facilities for telephone, telegraph, telephoto, and radio-broadcast program services. The first co-axial cable for regular commercial service was placed in service between Stevens Point, Wis., and Minneapolis, Minn. This one cable is designed to provide an ultimate of 480 circuits. All told, some 500,000 circuit miles were added to United States facilities during 1940 for long-distance telephone service.

Smaller twin cables are being used in place of a single cable for use with the new Type K carrier equipment, and a new plow has been devised to lay them underground simultaneously. They are being used on the current extension of transcontinental cable from Omaha to Denver. Especially in Ohio and Michigan, facilities have been extended to enable exchange operators to dial directly calls up to 200 miles or so instead of relaying them through local operators. The trend toward dial equipment continued, as represented by the additions of some 220,000 lines of the new crossbar dial-switching equipment at exchanges in all of the larger metropolitan areas, and by the conversion of 420 magneto exchanges to dial operation, and the extension of dial facilities for the interconnection of city and suburban areas.

Continuing its experiments with special services, the New York Telephone Company offered a new "leave-word" service through several of its New York City exchanges. Weather-announcing service, introduced in 1939 in New York City and Chicago, was made available during 1940 in Detroit, Boston, Baltimore, and Washington, D.C. This latter service makes use of voice messages recorded magnetically on an endless tape of "Vicalloy," an alloy newly developed by the Bell Telephone Laboratories and reputedly capable of greater magnetic strength and permanence than any other material.

By mid-year, according to FCC report, the extra charge for telephone handsets had been eliminated in a total of 31 States. In April in Carnegie Hall, New York City, the Bell Telephone Laboratories gave a striking demonstration of the remarkable quality, volume, and spatial characteristics of the stereophonic reproduction of "enhanced" music from film recordings. Triple sets of loudspeakers, one at each side and one in the center of the stage, together with properly synchronized separate sound records from the corresponding portions of the stage as occupied by the original orchestra, reproduced all sounds with the effect of true space relationship. It is to be expected that much more will be heard of this development in the future. Telephone exhibits at the New York and San Francisco expositions were visited by an estimated total of 20,000,000 persons during the two seasons.

Radiotelephone facilities to Europe at the close of 1940 included direct circuits from New York to London, Madrid, Rome, Berne, and Berlin; also interconnections to all of Europe except Gibraltar, France, Belgium, Luxembourg, the Netherlands, Russia, Greece, and Turkey. Service through European connections to Africa and parts of Asia was severed by the war, and of course war restrictions, including varying degrees of censorship, directly affect all service to all countries. With new direct radiotelephone links between the United States and South America, supplemented by ever increasing land-line and radio international interconnections, it is estimated that some 90 per cent of the 900,000 South American telephones now may be reached directly. In general, United States radiotelephone traffic for 1940 was nearly as great as for 1939, for increased calls to Hawaii and South America largely offset the war-loss of trans-Atlantic traffic. Ship-to-shore facilities in coastal waters now include more than 2,500 equipped ships and 20 shore stations connecting with land lines.

War conditions have prevented the collection of data necessary for any effective extension or revision of the tabular statistical summary given in the 1939 YEAR BOOK, p. 752. In general, as of Jan. 1, 1939, the reported total of 41,090,347 telephones in service throughout the world were distributed approximately as follows: United States and Canada, 52 per cent; Europe, 39; Asia, 5; remainder of world, 4 per cent.

G. ROSS HENNINGER.

**TELETYPEWRITER SERVICE.** See TELEGRAPHY.

**TELEVISION.** The failure of the industry's various technical authorities to agree on technical standards acceptable to the FCC (see RADIO, FEDERAL COMMUNICATIONS COMMISSION) resulted in the FCC withholding commercial licenses and in cancellation of the industry's merchandising plans, although numerous receivers were placed in service in the vicinity of New York City and in other

limited areas. On July 31 the Radio Manufacturers Association, in co-operation with the FCC, established a "National Television Systems Committee" to work on various controlling aspects of the problem of establishing generally acceptable technical standards. The year closed with a progress conference scheduled with FCC for late in January.

By Nov. 30, 1940, a total of 34 experimental telecasting stations had been authorized by FCC for construction. Commercial establishment of the frequency-modulation system of radio broadcasting (see RADIO) involved a shift in the frequency channels previously assigned to television by FCC. In August a private laboratory demonstration of television in full color was given by Columbia Broadcasting System to FCC Chairman J. L. Fly. The definition of telecast images was sharpened materially during the year by technical improvements. A new record for length of relay via land line was established when the Republican convention in Philadelphia was telecast from New York City stations through the medium of the Bell System's co-axial cable between those cities, a 108-mile transmission. New York City telecasts are being re-telecast for the Albany, N.Y., area through the medium of the General Electric Co.'s direct television relay station W2XB which was placed in operation during 1940, after successful field experiments. Theater-size television reproduction screens are under experimental development now in the United States. See FEDERAL COMMUNICATIONS COMMISSION; MUSIC; RADIO PROGRAMS.

G. ROSS HENNINGER.

**TEMPORARY NATIONAL ECONOMIC COMMITTEE (TNEC).** See FEDERAL TRADE COMMISSION; UNITED STATES under *Investigations*.

**TENANT PURCHASE PROGRAM.** See FARM SECURITY ADMINISTRATION.

**TENNESSEE.** Area, 42,022 square miles; includes water, 335 square miles. Population (U.S. Census), April, 1940, 2,915,841; 1930, 2,616,556. Memphis (1940), 292,942; Nashville (the capital), 167,402; Chattanooga, 128,163; Knoxville, 111,580. The increase in the population of the State (1930-40) amounted to 299,285, a rise of 11.4 per cent. The urban population (dwellers in places of 2500 or over) increased by 128,099, to 1,024,637; the rural, by 171,186, to 1,891,204.

**Agriculture.** Tennessee harvested, in 1940, 6,112,500 acres of the principal crops. Of this area, 4 acres in 9 grew corn; nearly 1 in 8, cotton; over 1 in 4, tame hay. Corn, on 2,767,000 acres, bore 69,175,000 bu. (\$53,265,000 in estimated value to the farmer). Cotton, 735,000 acres, made 515,000 bales (\$24,205,000); tame hay, 1,644,000 acres, 1,597,000 tons (\$17,843,000); tobacco, 113,500 acres, 103,390,000 lb. (\$15,018,000); wheat, 379,000 acres, 5,116,000 bu. (\$4,349,000); sweet potatoes, 51,000 acres, 4,335,000 bu. (\$3,685,000); potatoes, 44,000 acres, 3,888,000 bu. (\$2,372,000). Farms numbered 247,617 in 1940 and averaged 74.7 acres.

**Mineral Production.** Tennessee's yearly production of minerals native to its territory, as stated in 1940 by the U.S. Bureau of Mines, attained \$34,428,512 for 1938. Coal, cement, stone, and phosphate rock, in the order named, gave the highest items to this total. Mines' output of coal rose to 5,280,000 net tons for 1939, from 4,472,403 tons (value, \$9,007,000) for 1938. Cement-makers' shipments increased to 3,677,116 bbl. (1939) from 3,390,871 bbl. (1938); by value, to \$5,613,477, from \$5,063,628. Quarries' sales of stone rose to 5,626,-

bootlegging would be stimulated by sharp increases in liquor taxation.

**TELEGRAPHY.** Out of four years of court proceedings under bankruptcy laws, Postal Telegraph, Inc., was set up as an independent United States land-line system, under the terms of reorganization of the Postal Telegraph & Cable Corp., and obtained a \$500,000 RFC loan for plant improvements and other corporate purposes. Since 1929, Postal has been a part of International Telegraph and Telephone Corporation's "international system," the remaining portions of which have been consolidated under two separate companies—All-America Corporation, and Commercial MacKay Corporation—all the equity of which is held by a third new organization, American Cable & Radio Corporation.

The new 5600-mile telegraph and telephone line between Moscow and Kharbarovsk, U.S.S.R., is said to be the longest line in the world and to provide for 19 duplex telegraph transmissions, 7 telephone conversations, and the transmission of photographs and radio programs.

International facilities placed in service during the year include a radio telegraph and short-wave station at Portland, Ore., for trans-Pacific service, a radio-photo circuit between San Francisco and Tokyo, and new circuits between New York City and the French Island of St. Pierre off Newfoundland, Finland, Barcelona, and the Belgian Congo.

Under war conditions in Europe and Asia and consequent world unrest and suspicion, communications abroad are hampered in degrees varying from code or language restrictions to direct censorship of individual messages.

Electromagnetic "storms" of unusual severity disrupted telegraph, cable, and radio communications throughout the world on Easter Sunday, March 24, and, to a lesser degree, subsequently. So severe were the storms that even teletypewriter services and electric power systems were affected. In the United States the disturbances centered in the metallic-ore-bearing regions adjacent to Lake Superior where ground-potential differences of as much as 750 volts were noted between different points.

An electric calculating machine capable of carrying out computations in "complex" numbers was built at Bell Telephone Laboratories in New York City. The machine is constructed entirely of standard telephone apparatus—relays, crossbar switching equipment, etc.—and may be operated from remote points over telegraph circuits through the medium of teletypewriter equipment. Improved voice-frequency carrier telegraph systems announced provide for up to 18 telegraph channels over a four-wire line, some capable of extension up to 22 channels.

Teletypewriter exchange service continued to expand. New "automatic concentrators" at strategic points enable groups of as many as 100 outlying subscribers to be handled over a small number of trunk lines out of the exchanges to "concentrator points," as compared with the previous requirement of an individual exchange line for each teletypewriter subscriber.

Statistics show that as of Jan. 1, 1939, the 6,730,500 miles of telegraph wire in operation throughout the world was distributed as follows: United States, 34.17 per cent; remainder of North America, 7.72; Europe, 33.39; Asia, 13.74; Africa, 3.08; Oceania, 2.41; South America, 5.49 per cent. See CIVILIAN CONSERVATION CORPS; FEDERAL COMMUNICATIONS COMMISSION.

G. ROSS HENNINGER.

**TELEPHONY.** National Defense activities resulted in abnormal expansion of telephone facilities in the United States, largely by causing normal developments originally programed for as far as 1943 to be initiated during 1940. New construction expenditures were reported as some \$400,000,000, the largest amount since 1931. A total of 21,870,000 telephones was estimated to be in service in the United States, an increase of about 1,040,000 over 1939, as compared with the increase of 878,000 for 1939 over 1938, and an all-time record increase for a single year. Telephone conversations during 1940 averaged 97,700,000 per day, about 6,000,000 more than in 1939. Completed toll calls totalled some 1,030,000,000, about 40,000,000 more than in 1939. The number of dial telephones on the Bell System increased by about 1,250,000.

Jan. 25, 1940, was the 25th anniversary of the opening of the first transcontinental telephone line to commercial operation. Now, there are four such lines, and modern carrier equipment added to them has greatly multiplied the number of communication channels provided by each. During 1940 the capacity of many important routes was increased by the further application of new carrier equipment on existing lines and by many new intercity cables, most of which were laid along new or "alternate" routes so that a storm or disaster in any one place would affect as little as possible the dependability of through service.

By the end of 1940 more than 70 per cent of the circuit-mileage used for toll service was in cable. The cable network extends over the Northeast, with branches as far south as Atlanta and as far west as Omaha and Dallas. One \$1,000,000 1940 project is the new underground cable between Baltimore and Washington which, in addition to ordinary wire conductors, carries four co-axial circuits and provides facilities for telephone, telegraph, telephoto, and radio-broadcast program services. The first co-axial cable for regular commercial service was placed in service between Stevens Point, Wis., and Minneapolis, Minn. This one cable is designed to provide an ultimate of 480 circuits. All told, some 500,000 circuit miles were added to United States facilities during 1940 for long-distance telephone service.

Smaller twin cables are being used in place of a single cable for use with the new Type K carrier equipment, and a new plow has been devised to lay them underground simultaneously. They are being used on the current extension of transcontinental cable from Omaha to Denver. Especially in Ohio and Michigan, facilities have been extended to enable exchange operators to dial directly calls up to 200 miles or so instead of relaying them through local operators. The trend toward dial equipment continued, as represented by the additions of some 220,000 lines of the new crossbar dial-switching equipment at exchanges in all of the larger metropolitan areas, and by the conversion of 420 magneto exchanges to dial operation, and the extension of dial facilities for the interconnection of city and suburban areas.

Continuing its experiments with special services, the New York Telephone Company offered a new "leave-word" service through several of its New York City exchanges. Weather-announcing service, introduced in 1939 in New York City and Chicago, was made available during 1940 in Detroit, Boston, Baltimore, and Washington, D.C. This latter service makes use of voice messages recorded magnetically on an endless tape of "Vicalloy," an alloy newly developed by the Bell Telephone Laboratories and reputedly capable of greater magnetic strength and permanence than any other material.

By mid-year, according to FCC report, the extra charge for telephone handsets had been eliminated in a total of 31 States. In April in Carnegie Hall, New York City, the Bell Telephone Laboratories gave a striking demonstration of the remarkable quality, volume, and spatial characteristics of the stereophonic reproduction of "enhanced" music from film recordings. Triple sets of loudspeakers, one at each side and one in the center of the stage, together with properly synchronized separate sound records from the corresponding portions of the stage as occupied by the original orchestra, reproduced all sounds with the effect of true space relationship. It is to be expected that much more will be heard of this development in the future. Telephone exhibits at the New York and San Francisco expositions were visited by an estimated total of 20,000,000 persons during the two seasons.

Radiotelephone facilities to Europe at the close of 1940 included direct circuits from New York to London, Madrid, Rome, Berne, and Berlin; also interconnections to all of Europe except Gibraltar, France, Belgium, Luxembourg, the Netherlands, Russia, Greece, and Turkey. Service through European connections to Africa and parts of Asia was severed by the war, and of course war restrictions, including varying degrees of censorship, directly affect all service to all countries. With new direct radiotelephone links between the United States and South America, supplemented by ever increasing land-line and radio international interconnections, it is estimated that some 90 per cent of the 900,000 South American telephones now may be reached directly. In general, United States radiotelephone traffic for 1940 was nearly as great as for 1939, for increased calls to Hawaii and South America largely offset the war-loss of trans-Atlantic traffic. Ship-to-shore facilities in coastal waters now include more than 2,500 equipped ships and 20 shore stations connecting with land lines.

War conditions have prevented the collection of data necessary for any effective extension or revision of the tabular statistical summary given in the 1939 YEAR BOOK, p. 752. In general, as of Jan. 1, 1939, the reported total of 41,090,347 telephones in service throughout the world were distributed approximately as follows: United States and Canada, 52 per cent; Europe, 39; Asia, 5; remainder of world, 4 per cent.

G. ROSS HENNINGER.

**TELETYPEWRITER SERVICE.** See TELEGRAPHY.

**TELEVISION.** The failure of the industry's various technical authorities to agree on technical standards acceptable to the FCC (see RADIO, FEDERAL COMMUNICATIONS COMMISSION) resulted in the FCC withholding commercial licenses and in cancellation of the industry's merchandising plans, although numerous receivers were placed in service in the vicinity of New York City and in other

limited areas. On July 31 the Radio Manufacturers Association, in co-operation with the FCC, established a "National Television Systems Committee" to work on various controlling aspects of the problem of establishing generally acceptable technical standards. The year closed with a progress conference scheduled with FCC for late in January.

By Nov. 30, 1940, a total of 34 experimental telecasting stations had been authorized by FCC for construction. Commercial establishment of the frequency-modulation system of radio broadcasting (see RADIO) involved a shift in the frequency channels previously assigned to television by FCC. In August a private laboratory demonstration of television in full color was given by Columbia Broadcasting System to FCC Chairman J. L. Fly. The definition of telecast images was sharpened materially during the year by technical improvements. A new record for length of relay via land line was established when the Republican convention in Philadelphia was telecast from New York City stations through the medium of the Bell System's co-axial cable between those cities, a 108-mile transmission. New York City telecasts are being re-telecast for the Albany, N.Y., area through the medium of the General Electric Co.'s direct television relay station W2XB which was placed in operation during 1940, after successful field experiments. Theater-size television reproduction screens are under experimental development now in the United States. See FEDERAL COMMUNICATIONS COMMISSION; MUSIC; RADIO PROGRAMS.

**TEMPORARY NATIONAL ECONOMIC COMMITTEE (TNEC).** See FEDERAL TRADE COMMISSION; UNITED STATES under *Investigations*.

**TENANT PURCHASE PROGRAM.** See FARM SECURITY ADMINISTRATION.

**TENNESSEE.** Area, 42,022 square miles; includes water, 335 square miles. Population (U.S. Census), April, 1940, 2,915,841; 1930, 2,616,556. Memphis (1940), 292,942; Nashville (the capital), 167,402; Chattanooga, 128,163; Knoxville, 111,580. The increase in the population of the State (1930-40) amounted to 299,285, a rise of 11.4 per cent. The urban population (dwellers in places of 2500 or over) increased by 128,099, to 1,024,637; the rural, by 171,186, to 1,891,204.

**Agriculture.** Tennessee harvested, in 1940, 6,112,500 acres of the principal crops. Of this area, 4 acres in 9 grew corn; nearly 1 in 8, cotton; over 1 in 4, tame hay. Corn, on 2,767,000 acres, bore 69,175,000 bu. (\$53,265,000 in estimated value to the farmer). Cotton, 735,000 acres, made 515,000 bales (\$24,205,000); tame hay, 1,644,000 acres, 1,597,000 tons (\$17,843,000); tobacco, 113,500 acres, 103,390,000 lb. (\$15,018,000); wheat, 379,000 acres, 5,116,000 bu. (\$4,349,000); sweet potatoes, 51,000 acres, 4,335,000 bu. (\$3,685,000); potatoes, 44,000 acres, 3,888,000 bu. (\$2,372,000). Farms numbered 247,617 in 1940 and averaged 74.7 acres.

**Mineral Production.** Tennessee's yearly production of minerals native to its territory, as stated in 1940 by the U.S. Bureau of Mines, attained \$34,428,512 for 1938. Coal, cement, stone, and phosphate rock, in the order named, gave the highest items to this total. Mines' output of coal rose to 5,280,000 net tons for 1939, from 4,472,403 tons (value, \$9,007,000) for 1938. Cement-makers' shipments increased to 3,677,116 bbl (1939) from 3,390,871 bbl. (1938); by value, to \$5,613,477, from \$5,063,628. Quarries' sales of stone rose to 5,626,-

210 short tons (1939) from 2,599,840 (1938); by value, to \$8,312,977, from \$4,237,351. The product of 1939 included 440,070 cu. ft. of blocks of marble for building and monuments; in value, \$2,536,624. Of phosphate rock, the producers' sales, plus their own utilization, rose to 936,448 long tons (minor quantities from Virginia included), for 1939, from 899,298 tons for 1938; by value, to \$3,856,505, from \$3,725,601. The Federal electric furnaces at Muscle Shoals, Alabama, used a great part of this rock to make phosphates for fertilizers, and two privately owned enterprises in Tennessee also operated; all used electric current from the Tennessee River. An estimate made by G. R. Mansfield and published in 1940 put the reserves of divers kinds of phosphate rock in Tennessee at 195,151,000 tons. Mines' production of ores of zinc (including some from Austinville, Va.) carried about 51,601 short tons of the metal (1940), valued at \$6,708,130, as against 56,225 tons for 1939 and 56,766 for 1938. Clay products attained (1938) \$1,499,108 (not to count pottery and refractories).

Of the total of primary aluminum (286,882,000 lb., valued at \$56,659,000) produced in the United States in 1938, 41 per cent was credited to the smelters at Alcoa, Tenn.; production mounted to new records in 1939 and again in 1940. Tennessee furnished electric energy to extract the metal, but its ore—bauxite—came mainly from Arkansas and from abroad.

**Education.** Tennessee's inhabitants of school age (from 6 years to 18) were reckoned at 538,844 whites (for May, 1938); Negroes, 106,960. Pupils enrolled in public elementary schools in the academic year 1939-40: white, 430,751; Negro, 93,708. In high schools: white, 108,008; Negro, 15,664. The year's expenditures for public-school education totaled, for whites and Negroes combined: elementary, \$17,362,244; high schools, \$11,866,053. For education beyond public school, \$1,315,000 was provided by public appropriation. Teachers numbered 15,727 in elementary and 4935 in high schools.

**History.** The heavy demand for aluminum in particular, and the industrial possibilities of the Tennessee Valley hydroelectric development in general gave importance to Tennessee's manufacturing, under the impulsion from Federal policy of increasing the Nation's means of defense. Plans were determined, in March, for building a factory to make newsprint paper out of Southern slash pine by the Herty process, already in use at Lufkin, Tex. The projected factory was to operate on TVA current; its prospective cost exceeded \$4,000,000.

The nominees of the Communist party were excluded from the State ballot: the State Board of Election Supervisors, which ordered the exclusion, acted on a law of 1935 to withhold recognition from any party advocating the overthrow of the Government or engaging in sedition or treason; the State Supreme Court (October 14) upheld the Communists' exclusion.

A memorial to Adolph S. Ochs, long publisher of the *Chattanooga Times*, was dedicated (November 12) in Point Park, on Lookout Mountain: the memorial was a building for a museum and an observatory.

**Election.** At the general election (November 5) the popular vote for President totaled 351,601 for Roosevelt (Dem.) and 169,153 for Willkie (Rep.). Gov. Prentice Cooper (Dem.) and U. S. Senator Kenneth D. McKellar (Dem.) were re-elected. Six Democrats and 2 Republicans, all incumbents, were elected U. S. Representatives; in yet another dis-

trict, the fifth, Joseph W. Byrns, Jr. (Dem.), son of the late Speaker of the House, was defeated by J. Percy Priest (Independent), in retribution for Byrns's having voted for the Fish amendment to delay the military draft.

**Officers.** Tennessee's chief officers, serving in 1940, were: Governor, Prentice Cooper (Dem.); Secretary of State, A. B. Broadbent; Treasurer, John Harton; Comptroller, Robert W. Lowe; Attorney General, Roy H. Beeler; Commissioner of Education, B. O. Duggan.

**TENNESSEE VALLEY AUTHORITY (TVA).** The Tennessee Valley Authority is a corporation wholly owned by the United States Government. It was established by the Tennessee Valley Authority Act of May 18, 1933, later amended in 1935 and 1939. The TVA Act stipulates among its objectives the improvement of the navigability and the provision for the flood control of the Tennessee River; provision for the agricultural and industrial development of the Tennessee Valley; provision for the national defense; and the development and distribution of incidental hydroelectric power to the public. The agency is further empowered to make such studies, demonstrations, and recommendations as will advance the economic welfare of the region involved.

In carrying out its program, the TVA is constructing in the river channels a series of high dams that will provide a navigable channel for boats of nine-foot draft from Paducah, Ky., to Knoxville, Tenn. These same high dams also provide great storage capacity for the control of destructive flood waters and at the same time create a large storage available for the development of water power.

At the close of the year, the Authority had completed and placed in operation six multipurpose dams, Norris, Wheeler, Pickwick Landing, Gunterville, Chickamauga, and Hiwassee, in addition to Wilson Dam, constructed during the World War. It was also operating, for power production, several hydro and steam generating plants purchased from the Tennessee Electric Power Company in 1939. Construction was progressing on Kentucky, Watts Bar, Fort Loudoun, and Cherokee dams. The last-named was authorized by Congress on July 31, 1940, as part of an emergency construction program to provide increased amounts of electric power for national defense. A new steam plant and new generating units at Wilson and Pickwick Landing Dams were included in the emergency program.

Power from the Authority's system is being sold at wholesale to more than 100 municipalities and co-operative associations, which distribute it to more than 400,000 ultimate consumers. Power revenues of the Authority in the fiscal year 1940 totaled \$15,300,000, of which \$4,300,000 remained as net income after provision for all power expenses. The 106 municipalities and co-operative associations distributing power as of June 30, 1940, reported combined gross revenues of \$21,624,000 and a combined net income of \$4,023,000. Rates under which TVA power is being sold save consumers more than \$9,000,000 annually.

Of the 26,000,000 acres comprising the Tennessee Valley drainage area, about 18,000,000 are in farms, of which one-third of the area is in farm woodlands, pasture, and cultivated crops. Practically all the remaining 8,000,000 acres are in forests, publicly and privately owned. Much of this forested area is not fully effective for purposes of water control, and some 7,000,000 acres of open

land in farms are so situated as to be subject to appreciable erosion.

Extensive effort is being made to reduce these losses in soil and water by improved farm and forest practices. Such practices must rest largely upon a self-sustaining basis if they are to be widely and permanently adopted. In line with these principles, therefore, Congress directed the Authority to take over the war-time Wilson Dam and the nitrate plants at Muscle Shoals, maintain them for national defense, and use them to develop and introduce new and improved forms of plant food.

Equipment has been developed for making a new fertilizer, calcium metaphosphate, containing more than 60 per cent of available phosphatic plant food ( $P_2O_5$ ) and the electric furnace method for producing a concentrated superphosphate analyzing 47 per cent  $P_2O_5$  has been improved. Other materials and processes are being investigated. The Authority has assisted industry in making use of developments.

Experiment stations of 47 States have taken up preliminary testing of TVA fertilizing materials. And in half the States more than 30,000 farmers, with the guidance of agricultural extension services, are testing and demonstrating TVA products in a practical way on their farms.

These farmers, selected by the neighbors, contribute their farms as community test-demonstration grounds. Around use of the phosphate, they adjust their farming toward a more stable agriculture, meet the cost of the changes, and keep records. The Authority supplies the phosphate, f.o.b. Wilson Dam, Ala. It is used only on water and soil holding sod crops, especially on legumes that transfer nitrogen from the air into the soil. These test-demonstration farms cover more than 5,000,000 acres and, through their influence on neighboring farms, affect the use of a much greater area.

Terracing and tree planting supplement water control with sod crops. Guidance has been given to farmers in terracing approximately 600,000 acres. Some 110,000,000 trees have been planted on the more seriously eroded areas. Most of them were set out by the CCC, but planting by farmers themselves is increasing.

During the six years that the Fertilizer Works has been in operation, to July 1, 1940, approximately 287,000 tons of concentrated phosphatic fertilizer have been produced. In round numbers, 111,000 tons of this went to test-demonstration farmers and 156,000 tons were transferred to the Agricultural Adjustment Administration, of the U.S. Department of Agriculture, for use in lieu of cash payments in the national soil conservation program.

At the request of the U.S. Department of War, TVA is building a new plant and modernizing the nitrate works at Muscle Shoals to produce ammonium nitrate for munitions at a capacity of 300 tons a day.

Under Sections 22 and 23 of the TVA Act, the Authority serves as a strong unifying agency within the region, placing its experience in the conservation and use of resources at the disposal of the public, co-operating with states, localities, and organizations in the solution of related problems and in the development of mutually consistent programs. As authorized by law, it conducts demonstrations and experiments to pave the way for action by other governmental units.

See DAMS; MUNICIPAL OWNERSHIP; NATIONAL DEFENSE ADVISORY COMMISSION; WATERWAYS,

INLAND; also ALABAMA and TENNESSEE under History.

H. A. MORGAN.

**TENNIS.** The overthrow of Robert L. Riggs, Jr., of Chicago as men's national tennis king and the phenomenal playing of Miss Alice Marble of California, winner of the women's crown for the fourth time, were the principal highlights in the 1940 world of net and racket. With international competitions brought to a standstill as a result of the European war, and with no further amateur tennis honors to tackle, Miss Marble joined the professional ranks in November, 1940, after one of the most amazing records in the history of women's lawn tennis.

The one-year reign of Riggs was brought to an inglorious conclusion by Donald McNeill of Oklahoma City who overcame a two-set deficit to defeat the tottering champion at Forest Hills. It was evident that neither contestant was at his best, and the defending champion was suffering from the effects of a devastating cold. It was spirit and determination that carried McNeill to victory.

In dominating the women's field, Miss Marble scored a dramatic victory in the final at Forest Hills over Miss Helen Jacobs, former titleholder, whose unconquerable spirit kept her in the running until the last round. Miss Marble won every set in the championship and was invincible throughout the season in both singles and in doubles, serving with Sarah Palfrey (Mrs. Elwood Cooke) in the latter. Miss Marble and Riggs garnered the mixed laurels.

The men's national doubles were won by John Kramer of Montebello, Calif., and Frederick (Ted) Schroeder of Glendale, Calif., both 19 years of age and the youngest titleholders in the history of the match. They dislodged Henry Prusoff of Seattle and Gardnar Mulloy of Miami in the final at Boston. Kramer's playing was consistently sensational throughout the year. Besides Prusoff, he scored notable victories over Frank Parker, Sidney Wood, Gilbert Hunt, and Edward Alloo but faded out in four sets before Donald McNeill.

Some of the most exciting and humorous incidents of the season were provided by Frank Kovacs of Oakland, Calif., who scored a brilliant victory over Riggs at Southampton and nearly duplicated the performance in a final-round at Seabright. Kovacs mixed his dazzling game with pantomime designed to make the galleries laugh. He reached the finals both at Newport and Southampton, but succumbed on both occasions before the terrific speed and drive of McNeill.

In the championships at Forest Hills, Kovacs' clownish antics kept the spectators in a constant swirl of laughter. At one point his opponent, Joe Hunt, appealed to the galleries to halt their tittering and assume a more serious state of so-called mind, a psychological condition which the galleries found it impossible to attain. In desperation, Hunt sat down on the court, a move which Kovacs promptly emulated, to the further alleged amusement of the crowd. The game was eventually won by Hunt.

McNeill captured the national clay-court and intercollegiate crowns, and was runner-up to Riggs in the Pacific Southwest, national indoor and Eastern turf championships. Miss Louise Brough of California annexed the girls' national title; Robert Carrothers, who won the junior crown, was afterward killed in an automobile accident.

Because of the war, there was no Davis Cup or women's Wightman Cup matches.

Donald Budge, world's professional title-holder, captured the American championship, outplaying Fred Perry in the final.

**TEXAS.** Area, 265,941 square miles; includes water, 3498 square miles. Population (U.S. Census), April, 1940, 6,414,824; 1930, 5,824,715. Houston (1940), 384,514; Dallas, 294,734; San Antonio, 253,854; Fort Worth, 177,662; Austin (the capital), 87,930.

**Agriculture.** Texas harvested, in 1940, 25,826,000 acres of the principal crops: nearly 800,000 above the harvest of 1939. Cotton, occupying 8,523,000 acres, or one-third of the harvested area, bore 3,285,000 bales (\$147,825,000 in estimated return to the cultivator). Corn, on 4,632,000 acres, made 90,324,000 bu. (\$46,968,000); rice, 291,000 acres, 16,005,000 bu. (\$11,684,000); Grain sorghums, 3,659,000 acres, 46,397,000 bu. (\$24,126,000); wheat, 2,850,000 acres, 29,355,000 bu. (\$18,787,000); oats, 1,375,000 acres, 37,125,000 bu. (\$10,395,000); tame hay, 1,184,000 acres, 1,341,000 tons (\$10,192,000); peanuts, 295,000 acres, 166,675,000 lb. (\$5,334,000); grapefruit, 15,000,000 boxes (\$4,350,000); sweet potatoes, 51,000 acres, 4,335,000 bu. (\$3,468,000); potatoes, 50,000 acres, 3,200,000 bu. (\$3,200,000). The year's truck crops had an estimated value of \$17,256,000 for the growers.

**Mineral Production.** Texas produced from its territory, as estimated in 1940 by the U.S. Bureau of Mines, minerals to the value of \$740,147,465 in 1938. Petroleum contributed five-sevenths of the total; natural gas and gasoline derived therefrom, over one-fifth; sulphur, much of the remainder. The yearly production of petroleum, from 475,850,000 bbl., value \$539,150,000 (1938), rose in quantity to 484,527,000 bbl. for 1939 and attained 453,115,000 for 11 months of 1940. The West Texas field gained in production through 1939 and 1940; the East Texas field, still the foremost producing area, decreased as a producer in both these years, a fall in the initial pressure discouraging new drilling in some parts. The quantity of natural gas delivered to consumers, 882,473 million cu. ft. (1938), had a value of \$133,486,000; increases in several main uses of natural gas were reported for 1939. The production of gasoline from natural gas rose to 704,707,000 gal. for 1939, from 685,920,000 (value, \$19,781,000) for 1938. The production of sulphur increased to 1,665,785 long tons (1939) from the unusually low total of 1,331,014 tons for 1938. The apparent value of the total for 1939 approximated \$25,000,000. Portland cement shipped yearly by producers rose in value to \$12,152,780 (1939), from \$11,885,494 (1938).

**Manufacturing.** Value of the yearly output of manufactured products of Texas totaled \$1,530,220,676 for 1939; \$1,581,422,401 for 1937. Other related totals for 1939 (each with that for 1937 subjoined): 5376 (4422) establishments employed 126,997 (129,501) wage-earners, paying them \$128,138,702 (\$132,505,115); expended \$1,075,763,628 (\$1,141,567,954) for material, contract work, etc.; and added by manufacture a value of \$454,457,048 (\$439,854,447).

**Education.** For the academic year 1939-40 the inhabitants of school age were reckoned at 1,536,910. The year's enrollments in all public schools numbered 1,345,668; this comprised 788,104 in elementary study and 557,564 in high school. Expenditure for public-school education totaled \$92,865,745. The 45,600 public-school teachers' yearly pay averaged \$1059.

**History.** Barriers to the shipment abroad of Texan cotton and products of petroleum worked as a somewhat adverse influence on industry in the State. The AAA's further reduction of the allowed acreage of cotton in Texas, by about 222,000 acres, gave the growers widespread dissatisfaction early in the year. The producers of sulphur benefited by the Federal defense program; it increased the activity of producers of steel, of which some kinds required much sulphuric acid for their processing. The efforts of the Railroad Commission to hold the output of petroleum down to the estimated demand encountered opposition from time to time in some of the several hundred producing areas, not all of which were treated alike. A charge made in March, by an official of a company producing petroleum, that a deputy oil-supervisor of the Commission's force had intimated a bribe as the alternative to lower allowable production for that company, came at a time when producers were already sensitive to the Commission's course. One of the aspirants for the governorship sought the support of the people wishing larger old-age pensions, by promising to get these chiefly out of additional taxes on the petroleum business. Hope of an addition to the consumption of Texan petroleum arose in September from reported negotiations of the Federal Government with the Humble Oil and Refining Company for the construction of a costly establishment to produce toluol out of petroleum by a new cracking process.

Successful tests were reported, early in February, of the serviceability of newsprint paper made from loblolly pine by the new mill using the Herty process, at Lufkin; the Shreveport *Times* and Little Rock *Democrat* ran off editions with good result, strengthening prospects of a sizeable new industry for the State.

**Administration and Courts.** Governor O'Daniel made no further effort to call a special legislative session to put through, in advance of election, the means of paying for the expensive system of old-age pensions that he had championed. He was criticized in January for failure to condemn the conduct of the Board of Control, including two of his own appointees, which was editorially accused of spoilsmanship. He retained and, by radio talks, built up his popularity among the people of the State. Without much trouble he won a renomination at the primaries. Confirming his nomination, the State Democratic convention (September 10) also confirmed the Democratic popular choices to other offices, despite differences among their views; one of these choices, J. E. McDonald, renominated for the State's Commissioner of Agriculture, was denounced by many Democrats as in sympathy with the Republican Presidential nominee. It remained uncertain whether O'Daniel, in his next term would find the necessary support to put through his policies.

The U.S. Supreme Court (November 25) freed a Negro who had been sent to prison for life, on conviction, in Harris County, for rape; the decision held that Negroes had been excluded from the jury that tried him; his conviction was therefore reversed; the statute of limitations, as he had served two years in prison, prevented his retrial. A Court of Civil Appeals decision, early in February, denied the constitutionality of the Legislature's act of 1939 granting to Dallas County a remission from the State's share of the general tax on property in the county. The State Supreme Court, on the other hand, held valid, in June, the Legislature's similar remission of taxes to Harris

County; this decision Attorney General Mann, in a motion for a rehearing, called a "grievous error" setting at naught the efforts of the framers of the State's constitution of 1876 to do away with the Legislature's practice of thus presenting some counties with part of the State's revenue. An order of the Railroad Commission, putting an end to regional differentials in the rates of railroads within the State, was kept inoperative by a court injunction, in course of appeal. See DAMS; OKLAHOMA.

**Elections.** At the general election (November 5) the popular vote for President totaled 840,151 for Roosevelt (Dem.) and 199,152 for Willkie (Rep.). The opposition of the State's "favorite son," Vice-President John Nance Garner, to the re-election of Roosevelt for a third term, had little apparent effect on the vote, for Garner had refrained from expressed opposition after Roosevelt's nomination. But other dissident Democrats got out for Willkie nearly twice Landon's 1936 vote.

The vote on November 5 confirmed, as usual, the results of the Democratic primary: Gov. W. Lee O'Daniel was re-elected. U.S. Senator Tom Connally obtained another term.

**Officers.** The chief officers of Texas, serving in 1940, were: Governor, W. Lee O'Daniel; Lieutenant Governor, Coke R. Stevenson; Secretary of State, Tom L. Beauchamp; Treasurer, Charley Lockhart; Comptroller, George H. Sheppard; Attorney General, Gerald Mann; Superintendent of Public Instruction, L. A. Woods.

**TEXTILES.** The two-year cycle in textiles has been one of the lesser, and one of the least-mourned, casualties of a world at war. Whereas, in "normal" times, statisticians could anticipate that a "good" year would be followed by an "off" year, 1940 superimposed a new record high upon the previous record of 1939. *Textile World's* index of textile mill activity for 1940 was 142 (on the basis of 1923-25 as 100)—an increase of 8 per cent over 1939.

The effect of the war in 1940 was more direct than it had been in the previous year. In 1939, textiles shared psychologically in the war boom which followed the outbreak of hostilities in Europe. In 1940, the industry participated directly in the Government purchases in national defense. The percentage which such purchases represented in total production varied widely among the several branches of textile manufacture, ranging from a relatively few per cent in the case of cotton products to approximately a third in the case of wool goods. However, in addition to this direct stimulus, all divisions of the industry felt the effect of the sharply increased purchasing power of the nation as a whole—due primarily to the record production levels in the heavy-goods industries.

These impulses were still dominant at the start of 1941, and textile manufacturers faced the New Year confident in the maintenance of high production levels. That, however, was where confidence stopped. Never has a textile boom been tinged with greater sobriety. The knowledge of a mounting defense bill which would have to be paid some day, possibly by inflation followed by deflation; of inevitable increases in corporate taxes which would dissipate temporary profits, and of possibly eventual American participation in the war itself, reduced current "prosperity" to merely an interlude. See CHEMISTRY, INDUSTRIAL; ELECTRICAL INDUSTRIES; FASHION EVENTS; RAYON.

**Cotton.** Domestic cotton consumption reached an all-high record of 8,000,000 bales in the calen-

dar year 1940. It is anticipated that consumption for the crop year ending July 31, 1941, may reach 8,500,000 bales, or even higher. Demands of the national defense program created temporary bottlenecks in ducks for tents and other purposes, and in combed yarn and combed-yarn fabrics necessary for the production of cotton cloth for uniforms. The duration of these bottlenecks depends upon the additional Government orders which may be placed during the balance of the fiscal year ending June 30, 1941, and this in turn depends upon the rate of increase in the urgency of the national defense situation. Broadly speaking, there is no prospect of a serious emergency in the production of textile materials to meet the demands of the defense program. At the worst, it would mean temporary reduction of the production of goods for civilian requirements.

The wage-hour law, with its 32.5-cent minimum in the cotton industry, which was the outstanding issue during most of 1939, became of only academic interest in 1940, under the pressure of high production schedules. The only echo of this fight during the year was the suit against the constitutionality of the wage-hour law brought by a group of southern cotton mills, decision on which was pending before the United States Supreme Court at the start of 1941.

**Wool.** The effect of the national defense program was clearly evident in wool manufacture. Monthly average consumption of apparel-class wool by domestic mills during the first part of the year was lower than that of the corresponding period of the previous year, but starting in May, when the defense program got under way, an upward trend set in and established the highest rate of monthly consumption on record (1918 to date) and possibly the highest record ever attained in the United States, according to the National Association of Wool Manufacturers. For the calendar year 1940, apparel wool consumption was slightly over 1939. It is estimated that the effect of the defense program has been to add approximately one-third to the normal civilian consumption of wool.

**Rayon.** Domestic rayon filament yarn consumption set an all-time high record in 1940 with an estimated total of 390,000,000 lb., an increase of 8 per cent compared with the previous record year of 1939, according to *Rayon Organon*. On the other hand, rayon staple fiber available for consumption, which amounted to about 96,000,000 lb. in 1940, was slightly under the 1939 level of 98,700,000 lb. Imports of staple fiber in 1940, included in this consumption total, amounted to about 16,000,000 lb., a drop of 65 per cent from the 1939 level. Production of domestic staple fiber, however, rose from 51,300,000 lb. in 1939 to approximately 80,000,000 lb. in 1940, an increase of 55 per cent which almost completely offset the drop in consumption of imported staple fiber. The domestic rayon filament yarn industry, although operating at capacity, closed the year 1940 with only a four-days' supply of yarn at producers' plants, which is essentially the irreducible minimum.

**Silk.** The only exception to this textile success story is silk. Domestic consumption of this fiber in 1940 was the lowest in nearly 20 years. The main contributing cause was the loss of part of its market in women's full-fashioned hosiery, which is its major outlet. Nylon hosiery was introduced during 1940 and created a sensation, the demand exceeding the supply. Silk's competitive position in hosiery threatens to become worse since, al-

though Nylon accounted for only 10 per cent of the production of women's full-fashioned hosiery at the end of 1940, this percentage was increasing right along, at the expense of silk.

DOUGLAS G. WOOLF.

**THAILAND (Siam).** An independent monarchy of southeastern Asia. Capital, Bangkok. King, Ananda Mahidol. The name Thailand replaced the former name, Siam, by official designation, effective from June 24, 1939.

**Area and Population.** Area, 200,148 square miles. By estimate, the population of Jan. 1, 1939, numbered 14,900,000; by census of May 23, 1937, 14,464,489. Bangkok, capital and chief city, had (1937) 886,150 inhabitants. Ethnically, some nine-tenths of the people of the kingdom are Thai (or Siamese) and Laos. The chief other stocks are Chinese (about 500,000), Malays and Indian (about 500,000 for both combined), Cambodians (60,000), and Europeans and Americans (some 2000 only, but economically important). The prevailing and official language is Siamese, linguistically related to the Chinese.

**Education and Religion.** School instruction is free and compulsory, but only about 35 per cent of the population of sufficient age was classed as literate in 1938. Schools numbered 10,616 of divers types in 1938 and had 1,309,919 pupils. Chulalongkorn University, at Bangkok, provided higher education in several branches; the University of Moral and Political Sciences taught law, economics and subjects for the training of public servants. Nine-tenths or more of the people were of the Buddhist faith, according to common estimate; most of the followers of other faiths were Moslems, but a considerable number (49,462 in 1930) were Christians.

**National Defense.** Able-bodied males from 18 to 43 years of age are liable to military service, first in the active forces, later in the reserves. Active service is not generally required. The army in active service prior to 1940 was supposed to number about 30,000, including 21 battalions of infantry, a force of cavalry, an anti-aircraft regiment and additional battalion, a separate artillery organization, 2 battalions of engineers, and an air force of 5 wings. The navy included 4 vessels for coast-defense, 4 submarines, a number of torpedo boats, and transports, not to count vessels in course of construction.

**Production.** The great majority of the workers (in 1939, 83 per cent) support themselves by agriculture. Rice, the predominant crop, was estimated as yielding, in the season of 1939-40, 225,152,000 bu.; by estimate from another source, 5,082,700 metric tons; crop of 1938-39, 4,523,700 metric tons. In the season 1938-39 were produced also 20,400 metric tons of tobacco; in 1936-37, 157,944,880 coconuts and 3280 piculs of pepper. A somewhat recently developed production of rubber attained 4800 tons for 1938; for 1939, 4200. Livestock, 1937: 10,723 elephants, 374,236 horses, 5,618,006 bullocks, 5,333,464 buffaloes. The chief mineral product, ore of tin, was produced, in 1939, to the total of 17,900 metric tons of metallic tin contained. Teak, the leading product of the forests, was produced on a great scale for export (see Foreign Trade, below). Manufacturing was largely restricted to saw mills and rice mills; but the government operated a factory for making airplanes and a cotton-weaving factory.

**Foreign Trade.** For 1939, in terms of U.S. money, Thailand's imports were reported at \$51,-

314,000; exports, at \$83,320,000. The main exports of the year were 1,936,400 tons of rice (\$43,687,000); ore of tin, \$16,570,500; rubber, 41,000 tons (\$10,557,000). Export of teak amounted to nearly \$3,000,000 for 1939. Of the imports of merchandise in 1939, cotton textiles and yarns made 20 per cent by value; foreign foods, 15 per cent; iron and steel manufactures, machinery, and electrical goods, about one-fifth. Most of the exports went out through the Federated Malay Straits; particularly, the ore of tin, there treated. The Federated Malay States sent (fiscal year 1939) over one-fourth of Thailand's imports; the United Kingdom, 11.7 per cent; Japan, 14.7 per cent.

**Finance.** The unit of money is the baht, which in 1939 averaged \$0.4032 as valued in U.S. money. The national debt, on Jan. 1, 1940: external, £5,676,941 (or 62,446,531 bahts); internal debt, 10,000,000 bahts. The budget for 1939-40 fiscal year (ending with September 30) set revenue at 124,061,000 bahts; ordinary expenditure, at 124,059,000; and capital expenditure, at 22,889,000. The fiscal year was changed in 1939; it had, until then ended with March 31.

**Transportation.** Railways under operation in 1938-39, all State owned, totaled 2058 miles; they carried 5,722,766 passengers and 452,630,248 ton-kilometers of freight. Operating revenues were equivalent to \$6,735,992; operating expenses, \$3,154,896. An agreement for immediate construction of a railway from Mongkolborey to Aranya, connecting Thailand and French Indo-China for the first time, was signed by the two governments in 1939. Highways totaled 3398 miles (see ROADS AND STREETS). Bangkok is served by the Imperial Airways and Air France systems. A native air line connects the chief cities of northern Thailand. Improvement of the port of Bangkok at a cost of 10,000,000 bahts to permit entrance of larger vessels was under way in 1939. The shipping tonnage entered there with cargo in 1938 was 888,000; cleared, 1,176,000.

**Government.** The constitution of 1932 changed Thailand from an absolute into a limited monarchy. A Premier (in 1940 Luang Pibul Songgram) and a council of ministers, over which he presides, perform the executive functions but are responsible to an Assembly. Of the Assembly's members, half are elected, half appointed by the crown. King Ananda Mahidol, proclaimed in 1935 after the abdication of King Prajadhipok, is a minor. Save for the period from Nov. 15, 1938, to Jan. 13, 1939, the years of his reign have been spent at school in Switzerland. A Council of Regency exercises his powers; Prince Aditya Dibabha heads it.

**History.** Thailand sought, late in 1940, to win back areas lost in 1893 to FRENCH INDO-CHINA (q.v., for the origin of the resulting hostilities). The Siamese forces advanced a moderate distance into the contested territory in December after a period of aerial raids and fruitless negotiation, but the prospects of their operations remained uncertain at the end of the year.

The government of Thailand sought in its foreign relations to hold the favor of the British and the Japanese alike. A non-aggression agreement with Great Britain was signed in June. A goodwill mission from Thailand visited the British commercial center of Singapore in October and was to proceed later to Australia. A treaty engaging Thailand and Japan to respect each other's territories and not help each other's enemies for five years was signed at Tokyo on June 11, and a

mission headed by Thailand's vice-minister of war went to Japan in September. Producers in the United States having refused Thailand's orders for airplanes, a supply was reportedly obtained from Japan.

**THIRD INTERNATIONAL.** See **COMMUNISM**

**THIRD TERM ISSUE.** See **ELECTIONS**, **U.S. NATIONAL**.

**THURINGIA.** See **GERMANY** under *Area and Population*.

**TIBET.** A nominal dependency of China in central Asia. Area, 463,000 square miles; population estimated at from 700,000 to 6,000,000. Capital, Lhasa, 50,000 inhabitants. Lamaism, a development of Mahayana Buddhism, is the religion of the people. Chief occupations: agriculture, stock raising, wool spinning, and knitting. The principal minerals are gold, borax, and salt. There is a factory for the manufacture of army equipment, uniforms, coins, and paper money.

Since the death of the 13th Dalai Lama in 1933, the country has been ruled by a regent, whose political authority is exercised by a prime minister aided by a grand council. In September, 1939, a five-year-old Chinese peasant boy was accepted by a secret council at Lhasa as the new Dalai Lama and after a preliminary ceremony at Rigya near Lhasa in October, 1939, he was formally enthroned in 1940 (see below). When the boy comes of age, he will share his religious authority with the Tashi (Panchen) Lama. The last Panchen Lama died in 1937 and his successor, selected in the same manner as the Dalai Lama, remained to be discovered.

**History.** Enthronement of the 14th Dalai Lama, the Chinese peasant boy selected in 1939 (see **YEAR BOOK**, 1939, p. 761), took place Feb. 22, 1940, at the Potala monastery palace near Lhasa. The boy was referred to as Lingergh La-Mu-Tan-Chu by the Chinese and as Llamo Dhomdup by the British. Upon his enthronement, he assumed the name Jam-pel Ngawang Lobsang Yishey Tenzing Gyatso, deriving from the titles of former Dalai Lamas.

As the Dalai Lama, the boy became the chief civil and religious ruler of Tibet. Pending his 18th birthday, however, the powers of his office were exercised by the Regent, Jechen Hutukhto, who adopted a pro-Chinese policy while remaining on friendly terms with the British. The Chinese Nationalist Government at Chungking on February 5 formally recognized the boy ruler as the Dalai Lama and appropriated 400,000 yuan for expenses in connection with his enthronement. To insure his succession, the Chinese representative at Lhasa induced the Regent to forego the traditional lot-drawing from the golden urn, whereby one of La-Mu-Tan-Chu's two Tibetan-born rivals might have been selected.

The Regent formally recognized Chinese sovereignty by petitioning Gen. Chiang Kai-shek for permission to dispense with the lot-drawing and by unveiling a portrait of Dr. Sun Yat-sen, founder of the Kuomintang, during the enthronement ceremony. The Chinese Government's delegate was reported to have presided jointly at the ceremony, while all other foreign delegations were excluded. British and Indian delegations were present, headed by B. J. Gould, British political officer in Sik-kim. Their principal concern was the exclusion of Soviet and Japanese influence from Tibet.

**TIMOR.** See **PORTUGAL** under *Colonial Empire*.

**TIN.** Although the United States produced practically none of this important metal it was unusually active in 1940 in buying tin and its ores for the purpose of insuring an adequate supply for military and industrial purposes. In December the Metals Reserve Company, a Federal corporation, entered into a five-year contract with Bolivia tin ore producers for the purchase of ores and concentrates containing 90,000 tons of tin. A tin smelter was also projected, although its site, process, and operator were undisclosed at the end of the year. Eight plans were submitted and referred to a special technologic committee which was expected to make a recommendation to the Government. Another act of the Metals Reserve Company was to arrange for the purchase of 75,000 tons of pig tin within a period of 12 months from July 1, 1940, at a price of 50¢ per lb.

The domestic price for Straits tin in New York ranged from about 46¢ a lb. in January up to 58¢ in June and down to 50¢ at the year end. The average price for the year was 49.827, and for 1939, 50.323. On the London market the price trend was up from a monthly average of £240 per long ton in January to £273 lb. in June. Thereafter the price declined to £251 in September, and closed the year at £257. Imports into the United States for the first 10 months of 1940 were 223,952,110 lb.

World production of tin in 1940 was 236,600 long tons, an all-time high. Production in 1939 was 184,300 tons. The previous high record was 209,100 tons in 1937. Production quotas for the four quarters of 1940 established by the International Tin Committee in percentage of standard capacity of producers, were respectively, 120, 80, 130, 130.

Actual consumption of primary tin in the United States during 1940 was estimated at 74,000 tons.

Exhaustive survey of Alaskan tin resources seemed imminent near the end of 1940 in order to augment the supply of Bolivian tin ore and to insure the permanent establishment of a tin smelting industry in the United States. Alaska has been a producer of small quantities of placer tin for a number of years, the highest recent production being 166 tons in 1937. Lode tin also occurs in the territory. See **BOLIVIA** under *History*; **NATIONAL DEFENSE ADVISORY COMMISSION**.

H. C. PARMELEE.

**TIRES.** See **RUBBER**.

**TIROL.** See **AUSTRIA** under *History*.

**TOBACCO.** The tobacco crop of 1940 in the United States was estimated by the U.S. Department of Agriculture at 1,376,471,000 lb., about 26 per cent smaller than the record 1939 crop of 1,858,364,000 lb., and comparing with the 10-year (1929-38) average production of 1,360,661,000 lb. The harvested acreage totaled 1,427,000 acres compared with 2,020,000 in 1939, while the 1940 average acre yield was 965 lb., a record, compared with the previous record of 920 lb. in 1939. The value of the 1940 crop was estimated (preliminary) at \$226,874,000 versus \$285,997,000 for 1939. The price per pound received by farmers averaged 19.6¢ on October 15 and 15.0¢ on Dec. 15, 1940, versus 13.8¢ in December, 1939. The production by types was estimated for flue-cured, 733,903,000 lb.; fire-cured, 99,370,000; air-cured, light; Burley, 327,708,000 and Southern Maryland, 31,920,000; air-cured, dark, 42,512,000; and cigar types, 141,058,000, including filler, 65,000,000; binder, 66,964,000; and wrapper, 9,094,000 lb. Acreages, especially of flue-cured types were sharply curtailed to comply with AAA allotments and because of the poor export outlook. Yet

the record-breaking acre yields of all types, except cigar wrappers resulted in a crop exceeding the 10-year average. North Carolina continued to lead producing States with 506,820,000 lb., and was followed by Kentucky with 295,890,000; Tennessee 103,390,000; Virginia 97,540,000; South Carolina 81,590,000; Georgia 76,420,000; Pennsylvania 48,324,000; Wisconsin 36,532,000; Maryland 31,920,000; Ohio 26,430,000; Connecticut 22,996,000; and Florida 16,123,000 lb.

Tobacco crops in 1940 in other important producing countries, as estimated by several agencies, were for Turkey 135,600,000 lb., Greece 102,500,000 lb., Bulgaria 88,200,000 lb., Germany 96,200,000 lb., Hungary 35,500,000 lb., Canada 60,296,000 lb., Mexico 44,100,000 lb., Chosen 64,483,000 lb., Manchuria 40,000,000 lb., China (flue-cured) 122,500,000 lb., Japan 197,000,000 lb., Southern Rhodesia 35,000,000 lb., and Sumatra 22,000,000 lb. In 1939-40 the Philippine Islands produced 80,231,000 lb., Argentina 41,000,000 lb., Australia 4,800,000 lb., New Zealand 2,255,000 lb., Nyassaland 16,983,000 lb., and Union of South Africa 31,000,000 lb. Flue-cured tobacco grown in the principal foreign countries in 1939-40 was estimated to total 415,000,000 lb., and the combined production of flue-cured in China, Manchuria, Japanese Empire, India, Netherlands Indies, and Thailand in 1940 was estimated at 325,000,000 lb.

Internal revenue taxes collected on tobacco in the United States for the fiscal year 1940 amounted to \$608,518,444, an increase of \$28,359,238, or 4.9 per cent over 1939. Taxes on small cigarettes produced \$533,042,544, an increase of \$29,005,612 over 1939, representing 87.6 per cent of the total tobacco taxes collected in 1940. Taxes on large cigars amounted to \$12,897,764, an increase of only 0.8 per cent; and on smoking and chewing tobacco \$54,383,803, and snuff \$6,798,557, respective decreases of 0.7 and 1.9 per cent. Collections in North Carolina, Virginia, Kentucky, Pennsylvania, California, and Ohio in order, provided the greater part of the tobacco receipts. In the calendar year 1939, 180,666,824,480 cigarettes weighing less than 3 lb. per 1000 were manufactured, nearly 9 billion over 1938. Per capita consumption in the United States in 1939 averaged 42 large cigars, 1315 small cigarettes, chewing tobacco 0.81 lb., smoking tobacco 1.50 lb., and snuff 0.29 lb., totaling 7.30 lb. Exports of unmanufactured tobacco totaled 358,489,238 lb., worth \$77,421,911 in 1939, and 235,741,732 lb., worth \$44,044,749 in 1940. See *Annual Report on Tobacco Statistics, 1940*. (U.S. Dept. Agri.) See AGRICULTURAL ADJUSTMENT ADMINISTRATION; MEDICINE AND SURGERY.

**TOBAGO.** See TRINIDAD AND TOBAGO.

**TOGO, French.** The part of Togo mandated to France by the League of Nations. Area, 21,893 square miles; population (1938), 780,497. Lomé, the capital, had 114,380 inhabitants. Chief products: cacao, palm oil and kernels, copra, coffee, cotton. Trade (1939): imports, 91,644,000 francs; exports, 74,227,000 francs (franc averaged \$0.0251 for 1939). Budget (1939): balanced at 50,534,000 francs; in addition there was a railway budget of 12,889,000 francs. Railways extended for a total of 242 miles. Shipping (1938): 386 ships cleared the ports of Lomé and Aneho. The authorities of French Togo remained loyal to the Vichy Government in France in the controversy with Gen. Charles de Gaulle's rival "Free French" council in London. See FRANCE under *History*.

**TOGOLAND.** The area of Togo which was confirmed as a British mandate by the League of

Nations and attached to the British Gold Coast for administrative purposes. Area, 13,041 square miles; population (1938), 370,327, including 43 non-Africans. Chief products: Palm oil and kernels, cacao, kola nuts, cotton, coffee. Statistics of trade are included in the general total for the Gold Coast.

**TRACK AND FIELD.** With the cancellation of the 1940 Olympics because of the European war, international competition in track and field events came practically to a standstill during the past year. Domination of the sport by Americans continued unabated, however, and many records were annihilated. Perhaps the most sensational figure of the season was Greg Rice, a five-foot five-inch bantam out of Missoula, Mont., and Notre Dame University, who played first fiddle to the legendary Taisto Maki of Finland in a dramatic tournament at Madison Square Garden for the benefit of the Finnish Relief Fund.

In outstepping his Finnish adversary, Rice shattered the world indoor two-mile record with a clocking of 8 minutes 56.2 seconds, a fifth second from the recognized world outdoor mark, and twice superseded the indoor three-mile record with marks of 13:55.9 and 13:52.3. The last-named record was made in competition with both Don Lash and Maki. In the great outdoors, Rice added to his laurels by outdistancing Lash at Fresno, Calif., in a race in which he annexed the National A.A.U. 5000-meter outdoor championship with a world's record clocking of 14:33.4.

The year was noted for the arrival of new champions, particularly Walter Mehl, a mid-year graduate of Wisconsin. Unimpressive indoors, he was like a flash of lightning in the open air and once defeated Rice in the fastest two-mile Mehl had ever traveled, 9:01.8. In the mile field, Mehl captured the National A.A.U. 1500-meter title with a new American record of 3:47.9, which came within a tenth second of equaling the world's mark of Jack Lovelock. In this race, the aging Glenn Cunningham, a dominant figure on the track for many years, ran the fastest 1500-meter distance in his career, but lost to the youthful Mehl by two yards. The veteran Cunningham was consistently beaten throughout the year.

Charles Fenske, a former Wisconsin teammate of Mehl, won eight straight miles indoors, twice duplicating Cunningham's competitive record of 4:07.4, and captured the Memphis outdoor invitation mile in 4:08.3, but the onslaught of a cold kept him out of competition in outdoor nationals.

In pole-vaulting, Cornelius Warmerdam, of Olympic Club renown, was easily supreme. He was the first man ever to scale a height of 15 ft. The best of his two record leaps was 15 ft. 1½ in. The overlord of shotputters was Alfred Blozis, the Georgetown giant, who shattered the world's indoor record so frequently that almost everybody lost the count. His best mark was 55 ft. 8¾ in.

The year saw many champions, old and new. Among the eminent were Harold Davis, California junior college flyer, who carried off the na-

tional A.A.U. 100 and 200 meters; Grover Klemmer, California freshman, the 400-meter title holder who garnered a succession of 47-second quarters; Bill Watson in the decathlon; Joe McCluskey, steeplechase winner for the eighth time; Lash, Rice, and Charley Beetham in the 800 meters; Fred Wolcott, doubles hurdles champion; Phil Fox, discus champion; and Les Steers, master of the high jump. Besides regaining his hop-step-jump title, Billy Brown was the first white man to capture the national broad jump championship in nine years.

Fred Wolcott established new American records of 13.9 in the 110-meter and 120-yd. high hurdles and a world's mark of 22.5 in the low hurdles, in the last-named instance erasing one of Jesse Owens's former four records. In the half-mile, John Woodruff set a new world's record of 1.47.7 and a new American mark of 1.48.6 for 800 meters, both outdoors. Jimmy Herbert of N.Y.U. established a new indoor record of 1.10.8 for 600 yards and helped his college relay team set an indoor mile record of 3.15.

In college competition, Southern California's Trojans were supreme. The New York A.C. captured the indoor A.A.U. team championship again, but lost the outdoor crown to the Olympic Club of San Francisco. The I.C. 4-A outdoor team title went to Pitt and the I.C. 4-A indoor title to N.Y.U. One of the most spectacular competitions in the outdoor collegiate was the hair's-breadth victory of Ed Burrow of Princeton over Jimmy Lightbody of Harvard in the 880, which was consummated in 1:52.2.

**TRACTORS.** See FARM MACHINERY AND EQUIPMENT.

**TRADE.** See BUSINESS REVIEW; FEDERAL TRADE COMMISSION; INTERSTATE COMMERCE COMMISSION; MARKETING; TRADE, FOREIGN; and the sections on *Foreign Trade* under the various countries.

**TRADE, FOREIGN.** Foreign commerce of the United States and, commonly, of other lands varied much from normal in 1940. Blockades, scarcity of shipping, decline of production of the usual goods in countries at war, and intense demand for war's necessary goods all changed the volume, course, and content of the commercial stream.

U.S. commerce increased in yearly value: exports, by 26 per cent, to \$4,021,564,000 for the calendar year 1940, from \$3,177,176,000 for 1939; imports, by 13 per cent, to \$2,625,445,000 for 1940, from \$2,318,081,000 for 1939. Exports were the highest for any year after 1929; imports, the highest after 1937, and with that exception, after 1930. As will be seen from Table I, entitled *U.S. Foreign Trade, by Months*, neither the exports nor imports showed in 1940 the persistent rising trend that had marked their course in 1939; instead, they continued within fairly close range of the level of the latter part of 1939.

From Table II, entitled *Shift in Character of U.S. Trade*, appears the extensive transfer of U.S. commerce to exports and imports connected with warfare and away from other sorts of merchandise. In particular, exports of the main manufactured materials essential to war in the latter half of 1940 formed twice as great a part of all exports as it had formed in the earlier half of 1939 and was nearly 2½ times as great in dollars. Table III, shown on page 742, *Leading U.S. Exports and Imports*, shows yearly totals, whether exported or imported, of each of the items in the

I—U.S. FOREIGN TRADE, BY MONTHS  
[In thousands of dollars]

Merchandise	Exports and Re-exports		General Imports	
	1939	1940	1939	1940
January	212,911	370,082	178,246	241,992
February	218,716	347,106	158,072	200,068

\* Includes a few agricultural items    \* Includes a few non-agricultural items

customary classification of the articles of commerce. It displays some striking disparities: e.g. exports of firearms and ammunition about 13 times as great in value for 1940 as for 1939 and of tobacco only four-sevenths as great.

U.S. trade with other principal countries in 1940 varied widely in value from 1939's, in the great majority of cases, as appears in Table IV, *U.S. Foreign Trade, by Countries*. The variation did not generally imply any like variation in such countries' own totals of foreign trade. Rather, some countries traded more with the United States because deprived of other usual countries' custom and markets; others, because their needs as belligerents compelled them to depend more on the U.S. market, even though absorption in war caused their general trade to shrink; and in Sweden's case, a blockade greatly reducing trade overseas had an offset in heavy commerce with a great part of the European Continent.

Table V, *Trade of Leading Countries: 1940*, assembles the total imports and exports of 10

## IV—U.S. FOREIGN TRADE, BY COUNTRIES

(Merchandise: in thousands of dollars)

Country	Calendar Year 1939	Yearly Exports 1940	Yearly Imports 1939	Yearly Imports 1940

Argentina . . . . .	208,200,000	274,900,000

\* Excluding figures for France, Germany and Italy, which were not published. \* Excludes trade with possessions. \* Includes Burma.

(out of 13) other leading countries and that of the United States. The figures have all been reduced to U.S. dollars, not of the current standard, but of the pre-1934 gold standard.

See AGRICULTURE; CUSTOMS, BUREAU OF; Ex-

PORT-IMPORT BANK; TARIFF COMMISSION, U.S. See also topics on various products.

**TRADE AGREEMENTS.** See ARGENTINA, URUGUAY, and VENEZUELA under *History*; CUSTOMS, BUREAU OF; INTERNATIONAL LAW under *Treaties*.

**TRAFFIC SAFETY.** See AUTOMOBILES; BENEFACTIONS under *Automotive Safety Foundation*.

**TRANS-JORDAN.** An Arab territory in Asia Minor, under mandate to Great Britain. Area, 34,740 square miles; population, 312,000 (305,000 Arabs and 7000 Circassians and Chechens). Chief towns: Amman (capital), Es-Salt. Arabic is the official language and Mohammedanism the dominant religion. Education (1938-39): 191 schools and 13,854 pupils.

**Production and Trade.** To the east of the Hedjaz railway the country is largely desert but to the west the land is fertile and suitable for agricultural production and for livestock raising. Tobacco has been successfully grown and the output more than meets the requirements of the local factories. Phosphate deposits have been developed and potash is found in the Dead Sea. The Trans-Jordan section (213 miles) of the Haifa to Bagdad highway, to cost £1,500,000, was under construction during 1940.

**Government.** Finance (1938-39): revenue, £P529,615; expenditure, £P547,546. The territory is part of the British Palestine Mandate but certain clauses relating to the establishment of a national home for the Jews are excluded from operation within Trans-Jordan. The country is governed by an administration under the Emir, Sir Abdullah ibn Hussein, who is assisted by a council of ministers. There is a legislative council of 16 elected and 6 official members. A British Resident represents the High Commissioner for Palestine and Trans-Jordan.

**TRANSPORTATION.** See AERONAUTICS under *World Air Transport*; AUTOMOBILES; CALIFORNIA under *San Francisco*; INTERSTATE COMMERCE COMMISSION; NATIONAL DEFENSE ADVISORY COMMISSION; RAILWAYS; RAPID TRANSIT; ROADS AND STREETS; SHIPPING; also sections on *Transportation* under countries.

**TRANSPORTATION ACT.** See RAILWAYS.

**TRANSVAAL.** See SOUTH AFRICA, UNION OF.

**TRAVEL.** See IMMIGRATION, EMIGRATION, AND NATURALIZATION; NATIONAL PARK SERVICE; PASSPORTS. For number of persons entering the United States see CUSTOMS, BUREAU OF. For books on travel, see LITERATURE, ENGLISH AND AMERICAN.

**TRAVEL BUREAU, U.S.** The growing importance of recreational travel is manifested by the efforts of the Federal Government to foster its further development through the U.S. Travel Bureau. The Bureau was established in February, 1937, by the Secretary of the Interior to bring under one head the existing travel promotion work of the Interior Department. A branch office was established in New York immediately; a western office was set up in San Francisco in the fall of 1938. The central office is in the Interior Department in Washington.

At first, the Bureau functioned mainly as a national clearinghouse for the promotional literature of the various States and transportation and accommodation services. Its work quickly reached much greater proportions, and it has now become the central co-ordinating agency for the promo-

tional work of organizations interested in travel.

Recognition of the need for the kind of service the Bureau carries on resulted in passage of legislation by the 76th Congress "to encourage travel in the United States." This Act was signed by President Roosevelt in July, 1940, and the Bureau became a permanent part of the National Park Service.

The Bureau provides information to prospective travelers on seasonal recreation, hunting, fishing, trailer camps, and the dates and locations of such diversified attractions as Indian tribal ceremonies, sporting events of all kinds, fairs, historical celebrations and pageants, and other events of interest throughout the United States, its Territories, and island possessions.

It distributes, without charge, descriptive booklets and maps to aid in the planning of trips to the National Parks and other recreational areas. Both the New York and San Francisco branches maintain libraries of kodochrome slides and motion picture films for the use of schools, travel clubs, and other educational groups.

In co-operation with the private travel industry and public and governmental organizations interested in developing travel, the Bureau produces: Descriptive literature depicting, in both black and white and full color photography, the tourist attractions of the United States (some of this will be translated into several languages for distribution throughout the Western Hemisphere); radio broadcasts to dramatize the distinctive features and charm of tourist attractions throughout the Nation; news stories to bring constantly to the people's attention the recreational opportunities available to them; assistance in formulating State or regional promotional programs for those agencies requesting such service.

Pioneering in travel research, the Bureau has released valuable and hitherto unobtainable data on the size, value, and direction of the recreational travel movement, and its significance to the various aspects of the Nation's life.

Regular publications of the Bureau include: The *Official Bulletin* published monthly from Washington and devoted to publicizing the work of agencies engaged in the development of travel, providing a forum for the exchange of information, and furnishing accurate statistics of the travel movement; *Travel News* from San Francisco describing the outstanding travel attractions and services in the western half of the Nation; the *Calendar of Events* listing the dates and nature of the chief travel attractions throughout the Nation, published semiannually and with a monthly supplement; occasional publications containing news or reports of interest to travel organizations.

The Bureau is pioneering in the field of travel statistics. It is compiling a body of statistical data which will show the volume and flow of travel and its significance to the social, economic, and physical welfare of the Nation.

W. Bruce Macnamee is Chief of the Bureau; Jay Wingate, Supervisor, the New York office; J. Lee Bossemeyer, Supervisor, San Francisco office.

W. BRUCE MACNAMEE.

**TREASURER, U.S.** See FISCAL SERVICE.

**TREATIES.** See **INTERNATIONAL LAW**; also countries under *History*.

**TRENGGANU.** See **BRITISH MALAYA**.

**TRINIDAD AND TOBAGO.** A united British crown colony near Venezuela, consisting of the islands of Trinidad (1862 sq. mi.) and Tobago (116 sq. mi.), and adjacent islands. Total area, 1980 square miles; population (Jan. 1, 1939), 464,889. Chief towns: Port of Spain (Trinidad), the capital, 77,711 inhabitants; San Fernando, 15,858; Princetown, 5580; Arima, 5613; Scarborough (Tobago), 1515.

**Production and Trade.** Chief products (1939): petroleum (2,724,000 metric tons), asphalt (88,421 tons), cacao (8376 tons exported), sugar (92,200 tons for 1939-40), citrus fruits, coconuts, coffee, timber, and bananas. Minerals found in small quantities include coal, iron, graphite, gold, and gypsum. **Trade** (1939): imports, \$34,762,954; exports, \$35,731,557, including sugar (\$5,087,030), cacao (\$1,212,682), asphalt (\$1,170,585). The chief imports consisted of manufactured goods, foodstuffs, and beverages.

**Government.** **Budget** (1939): estimated revenue, \$12,882,274; estimated expenditure, \$12,492,118. The united colony was administered by a governor, assisted by an executive council. There is a legislative council of 26 members including the governor as president, 12 official and 13 unofficial members (of the latter, 6 are nominated by the governor and 7 are elected by the voters). There are 6 electoral districts in Trinidad and 1 in Tobago. Governor, Major Sir H. W. Young (appointed June 20, 1938).

**History.** The west coast of Trinidad in the Gulf of Paria was one of the sites granted to the United States for a naval and air base under the Anglo-American agreement of Sept. 2, 1940. However the governing authorities and Legislative Council of Trinidad objected to the specific sites selected shortly afterward by United States naval and air experts. The Governor flew to Washington in December to seek an adjustment and negotiations on the issue were still proceeding at the year's end.

Meanwhile Trinidad gave its full support to the British war effort. The Legislative Council on November 18 contributed \$1,000,000 to the Empire's war chest in addition to the colony's numerous volunteers for military service. Heavy emergency taxes were levied to meet the increased financial burden. See **BRITISH WEST INDIES** and **GREAT BRITAIN** under *History*.

**TRIPOLI.** See **LIBYA**.

**TROJAN HORSE.** See **FIFTH COLUMN**.

**TROTSKY, Leon.** See **COMMUNISM**; **MEXICO**; **NECROLOGY**.

**TRUCKS AND TRUCKING.** See **AUTOMOBILES**; **RAILWAYS**.

**TUAMOTU ISLANDS.** See **OCEANIA**.

**TUBERCULOSIS.** See **VETERINARY MEDICINE**.

**TUNGSTEN.** No shortage of this vital war metal was experienced during 1940, and ample supply enabled the United States to accumulate concentrates in a stockpile. Domestic production came principally from California, Colorado, Nevada, and this was supplemented by imports from South America and China. Purchase of Chinese ore was made against substantial loans by the U. S. Government. Consumption was at the rate of about 1000 tons of concentrates per month, which was much higher than originally estimated. Imports of ore

for the first 10 months of 1940 grossed 7,972,609 lb. The price of tungsten ore rose slightly during the year, reaching the following levels in December, 1940, per short ton unit of  $WO_3$ : Chinese, duty paid, f.o.b. New York, \$26; Bolivian and Portuguese \$25 to \$26; domestic scheelite, delivered, carload lots, \$23.50 to \$24.

H. C. PARMELEE.

**TUNISIA.** A French protectorate in North Africa. Capital, Tunis. With an area of 48,332 square miles, Tunisia had a population of 2,608,313 at the 1936 census, including 2,335,623 Arabs and Bedouins, 59,485 native Jews, 108,068 French citizens, 94,289 Italians, and 2279 Maltese. The estimated civilian population on Jan. 1, 1939, was 2,700,000. Italian census figures published July 22, 1940, placed the number of Italians in Tunisia at 125,000. The 1936 census populations of the chief towns were: Tunis, 219,578; Sfax, 43,333; Sousse, 28,465; Bizerte, 25,872; Kairouan, 22,991. Moslems comprise 89.5 per cent of the total population. The school attendance on Dec. 31, 1937, was 96,520.

**Production.** The chief occupations are agriculture, stock raising, fishing, and mining. Yields of the chief crops in 1939 were (in metric tons): Wheat, 505,000; barley, 350,000; oats, 30,000; olive oil, 60,000; wine, 988,000 hectoliters (hectoliter equals 26.42 U. S. gal.). The 1937 livestock estimates were 3,372,894 sheep, 507,302 cattle, 144,762 camels, 1,672,352 goats, 109,787 horses, 156,554 asses, and 56,615 mules. Output of the chief minerals in 1939 was (in metric tons): Phosphate rock, 1,608,045; iron ore, 764,731; lead ore, 28,280; pig lead, 23,403; mercury ore, 1943; zinc ore, 903; fluorspar, 2473. The principal native manufactures are woolen goods, carpets, leather goods, and pottery.

**Foreign Trade.** For the first six months of 1939 (publication of later statistics was suspended), imports amounted to 849,121,000 francs (699,477,000 for the same period of 1938) and exports to 752,408,000 francs (720,266,000). For the six months' period of 1939, imports came chiefly from France, 569,300,000 francs; Algeria, 44,826,000; the United States and the United Kingdom. Exports to France were 511,764,000 francs; United Kingdom, 79,871,000; Italy, 34,722,000; Algeria, 20,676,000. Wheat, olive oil, phosphates, and wine normally account for half the total exports.

**Finance.** Budget estimates for 1940 placed receipts at 811,198,000 francs and expenditures at 810,954,334. The receipts included new and increased taxes expected to bring in 76,300,000 francs. Public debt on Jan. 1, 1938, 1,009,593,000 francs (franc averaged \$0.0251 in 1939, \$0.0288 in 1938).

**Transportation.** With 1123 miles of line, the Tunisian State railways in 1938 carried 2,153,587 metric tons of freight. Highways extended 7887 miles in 1939. Civil airlines connect Tunis with Poona, Algiers, Oran, and Casablanca in French North Africa, with France and normally with Italy.

**Government.** Tunisia is a regency under the control of the French Foreign Office, which acts through a Resident-General who is also Minister of Foreign Affairs for Tunisia. There is a ministry of 11 departments (8 French and 3 Tunisian). The nominal ruler in 1940 was Sidi Ahmed Bey, who succeeded to the throne July 10, 1929.

**History.** The entrance of Italy into the European War on June 10, 1940, and the capitulation

of France to Germany soon afterward threatened to end France's 60-year rule over Tunisia. The acquisition of the colony had been a primary objective of Italian foreign policy since the establishment of the Fascist regime, and its transfer was demanded by Mussolini in his negotiations of 1940 with Hitler concerning the peace terms to be imposed upon France. As a preliminary to annexation, the Franco-Italian armistice terms provided for the demilitarization of the strong French fortifications on the Tunisian side of the Libyan border, carried out under the supervision of an Italian armistice commission. See FRANCE, GERMANY, and ITALY under *History*.

Late in the year Italian reverses in Libya and the Mediterranean at the hands of British forces aroused French hopes of retaining Tunisia and reinforced the Vichy Government's efforts to consolidate French power in North Africa (see ALGERIA under *History*). Marcel B. Peyrouton replaced Eirik Labonne as Resident-General on June 7, 1940. Upon Peyrouton's subsequent inclusion in the Vichy Government, Admiral Jean Esteva became Resident-General. On December 9 Marshal Pétain arrived in Tunis for a tour of inspection, which apparently was intended to calm the mounting political unrest caused by economic difficulties, the policies of the Vichy regime, and the general European situation. See EUROPEAN WAR under *Effects of the Fall of France*.

**TUNNELS.** Recent and present tunnel works include projects for water supply (domestic and irrigation), highways, and rapid transit. The longest, now under way, is the 85-mile tunnel for pumping a new water supply to New York City from the Delaware River. It is 18-ft. in diameter and has been driven from 31 shafts. Its excavation was 93 per cent completed at the end of 1940, but with the concrete lining and other accessory work unfinished it is probable that it will not be put into service until 1945. With two future extensions of 6 and 26 miles to other watersheds its ultimate length will be 117 miles. Including the 20-mile tunnel already in use (since 1936) from the new terminal reservoir to the city reservoir, there will be a continuous pressure tunnel of 137 miles.

Next to the Delaware Tunnel ranks the 11.3-mile Mono Craters Tunnel, in California, forming a part of the extensive water supply system for Los Angeles, 320 miles distant. This tunnel, 8 ft. 8 in. by 7 ft., was completed in December, 1940. For an additional supply to Baltimore, Md., the 7-mile Montebello Tunnel, completed in December, is 12 ft. in diameter, with concrete lining on 66 per cent of its length, while the remainder has a continuous welded steel lining.

Outstanding among several tunnels for the various irrigation projects of the U.S. Bureau of Reclamation (q.v.) is the 13-mile Continental Divide Tunnel, which was started at its east end in April and at its west end in July. It is a main item in the comprehensive Colorado-Big Thompson project, and is to pierce the Divide of the Rocky Mountain range in order to bring water from a reservoir on the western slope to the valley of the South Platte River on the eastern slope, in Colorado. Water pumped up to the west portal will flow by gravity through the tunnel, which is 9 ft. 9 in. in diameter inside the concrete lining. Work was also begun in September on the 5½-mile Duchesne Tunnel of the Provo River project in Utah. Tunnels completed by the Bureau in 1940 numbered 23, with an aggregate length of nearly six miles. These included a 3½-mile tunnel for the

Yakima Ridge main canal, and the 3-mile Shoshone Canyon conduit on the Heart Mountain canal in Wyoming. For the 30-mile relocation of the Southern Pacific Railway, to put it above the water level of the reservoir behind the Shasta Dam, in California, the Bureau built twelve tunnels aggregating 16,000 ft.

As to highway tunnels, excavation of the two-mile submarine tunnel between New York City (at the Battery) and South Brooklyn, was begun October 28, with a blast set off by President Roosevelt pressing a button at the White House in Washington. It is estimated to cost \$57,000,000, with \$24,000,000 more for the two approaches. The tunnel will consist of two steel-lined tubes 31 ft. in diameter, each providing a 21-ft. roadway. At its mid-length there will be a ventilating shaft on Governor's Island. Of similar design is the one-mile Queens-Midtown Tunnel under the East River at 36th St., New York. This first highway tunnel under the East River was opened to traffic on November 15.

The work of completing and enlarging the tunnels of the South Pennsylvania Railroad, to serve for a toll super-highway between Pittsburgh and Harrisburg, was finished in 1940. The railway project was begun in 1885 but abandoned in 1887, and the State authorities acquired possession of the unfinished grade and earthworks. The seven tunnels, aggregating nearly seven miles, were enlarged to about 30 ft. in width and 15 ft. in height.

A special type of subaqueous tunnel is that in which a concrete-lined steel tube or hull is sunk in a dredged trench, connections with the land tunnel approaches being made in cofferdams by the aid of divers. The 2000-ft. Bankhead Tunnel at Mobile, Ala., was placed across the river in this way in 1940. It is 27 ft. in diameter, and provides a 21-ft. roadway as part of a new toll-road route. Its land connections or approach tunnels are 500 to 600 ft. long. The welded steel tube, octagonal in shape, was built in seven sections, 256 to 298 ft. long, on launching ways in a shipyard, then taken to a dry dock for concreting, and then consecutively floated and towed into position and sunk into a trench, where they were connected end to end by divers.

A tunnel of the same length type and length, across the Maas River, at Rotterdam, Holland, was under construction when the war broke out, but the last section was placed in December, 1940, and war conditions had not greatly delayed the construction. In this case, the nine sections, each about 202 ft. long, were built mainly of reinforced-concrete and were of rectangular shape, 81 ft. wide and 27 ft. high. There were two passages with 20-ft. roadways for vehicles, and a third double-decked passage for foot passengers on the lower level and bicyclists on the upper level.

At Chicago, a tunnel of this kind was placed across the Chicago River at State St., as part of the new rapid-transit subway system. Being only 200 ft. long, it was built and placed in one complete section. The "tube" was sunk in place on Dec. 13, 1939, but with the work of connecting the ends and putting in the lining it was not completed until some months later. This is Chicago's second tunnel of the same type. The first was placed several years ago, when the old LaSalle St. masonry tunnel for a street-car line had to be rebuilt as it had become leaky and unsafe. The purpose and advantage of this type of construction is to provide a tunnel at shallow depth and having short approaches with easy grades. A driven tunnel, especially in

soft material, would have to be at considerable depth, requiring longer and steeper approach inclines.

The  $8\frac{3}{4}$  miles of twin tunnels for the new rapid-transit subway system of Chicago, to be completed in 1941, are mainly in clay and are at a depth of about 45 ft. from street level to floor of tunnel. They are excavated mainly by hand, and under pneumatic pressure, the steel lining following closely behind the excavation to hold the clay from sliding and to form the shape of the tunnel before the concrete lining is placed. In the Loop or business district, however, circular steel shields 25 ft. in diameter are used in order to hold the ground against any sliding, as some parts of the subways are near—and below—the shallow foundations of large buildings. Much of the excavated material is loaded into small cars and sent out through air-locks connecting with the small narrow-gauge freight tunnels of the Chicago Tunnel Co., thus keeping it clear of the streets.

The Transandine Tunnel, built in Chile in 1910 to connect the railways of Chile and Argentina, was reopened in February, 1940, after having been altered to provide for carrying motor-coach traffic. The tunnel had been closed for some years, as earthquakes had practically destroyed the approach on the Chilean side and the cost of reconstruction was prohibitive. There is now motor-coach service to connect the railways, and occasional trains are run through from the Argentine side. The summit or high point in the tunnel is 10,521 ft. above sea level.

Of a different class from any of the tunnels so far mentioned is the Carlton Drainage Tunnel at Cripple Creek, Colo., for the drainage of the deep levels of a group of mines, thus permitting the deepening of the mines. It will be six miles long, exclusive of branches, and has been completed for about five miles. It is 8 x 9 ft. in section, in a hard granite formation.

Rapid progress in tunneling in hard rock during 1940 has broken all former records. In the Delaware River water tunnel for New York City, a record of 1862 ft. of 18-ft. bore in 31 days was made, with an average advance of 60 ft. per day. In the Carlton drainage tunnel, an advance of 1879 ft. has been made in the same time, with a maximum of 74 ft. in one 24-hour day, and an average of 60.6 ft. per day. See AQUEDUCTS; RAPID-TRANSIT.

E. E. RUSSELL TRATMAN.

#### TURBINES. See POWER PLANTS.

**TURF.** The final emergence of *Seabiscuit* as the greatest money-maker of all time, the selection of *Chalcedon* as the outstanding horse of the year, and the successful establishment of mutual betting in New York State were the three most important headlines in the history of horse-racing during 1940.

By winning the Santa Anita Handicap in March, *Seabiscuit* boosted his earnings to a total of \$437,740, thereby surpassing the figure of \$376,744 by which *Sun Beau* held the record as the champion money-horse. The old saying that money makes money was reflected in the stud fees of the respective horses—*Seabiscuit* was quoted at \$2500, *Sun Beau's* price was only \$500.

On the whole, it was not an exciting year for turf fans. While *Chalcedon* was selected by the sportswriters as the greatest horse of the year, there were many who felt the choice to be unjustified. A number of beasts made claim to the

distinction—among them *Level Best*, *Nasca*, *Whirlaway*, *Our Boots*, *Mioland*, *Bimelech*, *Fenelon*, *Fairy Chant*, *Your Chance*, *Gallahadion*, *Eight Thirty*, *Can't Wait*, *Cottesmore*, and *Seabiscuit*.

*Chalcedon* got a comparatively late start, but managed to win five of seven races for combined yearly earnings of \$70,600. Most of his winnings came from the Hollywood Gold Cup and Pimlico Special, simple races both; and he experienced great difficulty in beating *Isolater*, an unimpressive horse, in the Whitney Stakes at weight for age.

*Bimelech* was generally conceded the champion among three-year-olds on the basis of performance; but there were some who felt that *Fenelon*, inactive early in the year because of a cough, was the better of the two. *Fenelon* captured the Travers at Saratoga and the Lawrence Realization and the Jockey Club Gold Cup at Belmont Park. *Mioland* triumphed in the Westchester Handicap at Empire City. However, the retirement of *Bimelech* with a bruised heel certainly made it easier for his rivals to ride to fame.

Among two-year-olds, the choosing of a champion was a hopelessly confusing task. At Saratoga, after starring in the Hopeful, it appeared that *Whirlaway* was in a class all by himself. But at Aqueduct *King Cole* was easily supreme; and at Belmont Park *Our Boots* beat all of them in the Futurity, richest race in the world for two-year-olds. Subsequently, in the Pimlico Futurity, *Bold Irishman* was the victor, beating *Our Boots* by a nose, with *Whirlaway* ending third.

The field of three-year-old fillies produced no undisputed champion either. *Damaged Goods* took the Acorn and the Coaching Club American Oaks, severest test for this division. Thereafter she failed to distinguish herself, and *Fairy Chant* was the leading money-maker, with \$46,750 for the season.

*Level Best* and *Cottesmore* were outstanding thoroughbreds of the year. Besides being the best young filly of the season, *Level Best* was able to beat colts when occasion was presented. In the steeplechasing division, *Cottesmore* was supreme.

Following establishment of mutual betting, attendance at horse races in New York State reached a peak of more than 2,000,000 for the year. Wagers totaled \$103,000,000, and the State's profit was \$6,000,000.

**TURKEY.** A republic comprising parts of Asia Minor and the Balkan peninsula as well as Imbros, Tenedos, and the Rabbit Islands in the Aegean Sea. Capital, Ankara (Angora).

**Area and Population.** The area, including the Sanjak of Alexandretta (Hatay Republic) but excluding 452 square miles of marshes and 3256 square miles of lakes, is 296,346 square miles (13,012 in Europe and 283,334 in Asia). The Sanjak of Alexandretta (area, 1930 square miles; pop., about 228,000) was ceded to Turkey by France on June 23, 1939. The population of Turkey at the census of October, 1940, was 17,869,901 (16,158,018 at the 1935 census). Populations of the chief cities in 1940 were: Istanbul, 789,346 (741,148 in 1935); Ankara, 155,544 (122,720 in 1935). The 1935 populations of other cities were: Izmir (Smyrna), 170,959; Seyhan (Adana), 76,473; Bursa (Brusa), 72,148; Konya, 52,093; Gazi Antep, 50,965.

**National Defense.** Military service is compulsory. The peace-time strength of the Turkish army is about 180,000 men, but the number under arms was increased during 1939 and 1940 to near the limit of 750,000. It is equipped with Czechoslovak, German, Polish, British, and Turkish armaments—not the most modern. At the beginning

of 1940, the air force had about 700 well-trained pilots, about 7500 in other ranks, and 575 first-line and 400 second-line planes. The navy in 1940 consisted of the rebuilt German battle cruiser *Goeben* (Turkish name, *Yavuz*) of 22,500 tons, 2 small obsolete cruisers, 4 destroyers, 6 submarines, and various smaller craft.

**Education and Religion.** Illiteracy was estimated at 55 per cent of the adult population in 1935, but only 2,517,878 were literate in the Latin alphabet, introduced in 1928. Students enrolled in 1937-38: Primary, 764,691; secondary, 74,107; lycées, 21,000; normal schools, 2807; professional schools, 7574; universities and other institutions of higher learning, 9558. At the census of 1935 there were 15,838,673 Moslems, 125,046 Orthodox Christians, 78,730 Jews, 32,155 Roman Catholics, 44,526 Gregorians, 11,229 Armenians, 8586 Protestants, and 12,967 adherents of other religions. There is no State religion.

**Production.** Four-fifths of the population is supported by agriculture. Yields of the chief crops in 1939 were (in metric tons): Wheat, 4,607,900; barley, 2,295,200; rye, 426,300; oats, 295,400; corn, 714,100; rice, 84,200; potatoes, 168,600 in 1938; beet sugar, 94,500 in 1939-40; tobacco, 56,500; cotton-seed, 134,500 in 1938; sesamum, 25,700 in 1938; olive oil, 33,800 in 1938; cotton, 66,300 in 1938; raw silk, 27,000 in 1938. The 1938 wool clip was 31,300 metric tons. Livestock as of Jan. 1, 1939: 23,138,450 sheep, 9,310,966 cattle, 885,117 buffaloes, 11,329,241 goats (exclusive of 4,945,351 mohair goats), 1,489,699 asses, 964,245 horses, 113,895 camels.

Output of the chief minerals in 1939 was (in metric tons): Cement, 274,742; iron ore, 143,277; borocite, 14,699; chrome ore (mineral content), about 97,000; zinc, 14,424; lead, 10,392; emery, 9528; lead and zinc mixed, 8007; manganese, 3339; sulphur, 2601; magnesite (raw), 435; antimony, 1280. There were also produced 359 flasks of mercury and 335 cases of meerschau. There were 65,245 industrial establishments with 256,855 employees in 1936. Since then there has been carried out an industrialization program under which textile mills, coking and steel and blast-furnace works, paper mills, a glass factory, sulphur plant, and various other factories were placed in operation.

**Foreign Trade.** Imports in 1940 were valued at 68,922,700 Turkish pounds (£T118,248,934 in 1939); exports, £T111,446,500 (£T127,388,997 in 1939). Due to the higher level of prices in 1940, the shrinkage in the volume of trade was greater than indicated in trade values. Turkish imports in 1940 came principally from Italy, £T11,224,300; Rumania, £T10,806,000; United Kingdom, £T9,665,300; Germany, £T8,083,000; United States, £T7,446,900. Of the 1940 exports, Italy took £T17,951,300; United States, £T15,738,740; Rumania, £T11,987,200; United Kingdom, £T11,550,900; Germany, £T9,686,500.

**Finance.** Ordinary budget estimates for 1940-41 (June 1-May 31) placed receipts at £T268,481,000 (£T261,110,000 in 1930-40) and expenditures at £T268,476,321 (£T261,064,192). In 1938-39, total actual receipts were £T326,783,891 (ordinary, £T257,392,772). Public debt on Mar. 31, 1939, £T619,400,000 (funded, 331,700,000; floating, 287,600,000), compared with £T553,600,000 on May 31, 1938. Average exchange value of the Turkish pound, \$0.8011 in 1938, \$0.8024 in 1939.

**Transportation.** Turkish railway mileage increased from 2533 miles in 1924 to 4578 in 1939; of the 1939 total, 4309 miles were government-

owned. An additional 461 miles of government line were under construction in 1940. Revenue of the State lines in 1938-39 was £T36,486,396; passengers numbered 23,227,908. Direct railway connections with Basra on the Persian Gulf were provided in 1940 with the opening of the last section of the Baghdad-Mosul line in Iraq (q.v.). Highways extended 25,656 miles in 1939. In August, 1939, there were four air services covering 1114 miles of route. During June, 1940, only 343 ships of 849,233 net tons entered the port of Istanbul as compared with 756 of 1,549,246 net tons entered during June, 1939. Istanbul handles about three-fourths of the total shipping trade of the country.

**Government.** The Constitution of Jan. 20, 1921, as amended in 1924 and 1934, vests executive and legislative power in the Grand National Assembly, consisting of 424 deputies elected for four years by universal male and female suffrage. The Assembly exercises executive power through the President, elected for four years by the Assembly, and through the Council of Ministers, chosen by the President. In practise the President wields dictatorial powers. President in 1940, Gen. Ismet Inonu, who was elected to succeed President Kemal Ataturk on Nov. 11, 1938, and re-elected Apr. 3, 1939. The People's party, the only legal political organization, in December, 1938, elected President Inonu as President General of the party for life. The cabinet appointed Jan. 25, 1939, and reorganized Apr. 4, 1939, was headed by Dr. Refik Saydam as Premier.

#### HISTORY

Throughout 1940 the threat of Turkey's involvement in the rapidly spreading European War (q.v.) grew steadily greater. The diplomatic and political bulwarks that Turkey counted upon to strengthen its security and safeguard its independence were shattered one after another. Most important of these bulwarks from the Turkish point of view was the long Soviet-Turkish friendship. This had been weakened during 1939 by the Soviet-German non-aggression pact and subsequent conclusion of Turkish alliances with Britain and France (see YEAR BOOK, 1939, p. 769). Early in 1940 Soviet-Turkish relations came near the breaking point and throughout the remainder of the year Turkish action in dealing with Germany, Italy, and the other European powers was guided primarily by the fear of a Russian attack.

The Turks believed Moscow would seize upon Turkish involvement in the European struggle to regain the districts of Kars and Ardahan on the Caucasus frontier, annexed by Turkey under the Treaty of Brest-Litovsk. Before Hitler took the initiative in the Balkans and blocked Russia's path, the Turks also anticipated a Soviet diplomatic-military drive through Rumania and Bulgaria to gain control of the Straits. This double threat from Moscow held the Turks inactive in the face of developments calculated to bring them into the war on the side of the Allies.

When Italy declared war on Britain and France on June 10, Turkey invoked the escape clause in its Anglo-French alliances and remained "non-belligerent." The Turks refused to budge from their position when Rumania was partitioned and converted into a German vassal and the Balkan Entente (q.v.) nullified. They refused to intervene when German troops poured into Rumania and prepared for the military occupation of Bulgaria; when Mussolini launched his attack upon Turkey's closest ally, Greece; and when Axis in-

fluence infiltrated into Syria, threatening to cut Turkish land communications with the British armies in Palestine and Egypt. However as the Axis menace to the Balkans and Turkey grew, estrangement developed between Germany and Russia that promised to abolish the Soviet threat to Turkey. At the end of 1940, the Turks appeared confident of obtaining Moscow's pledge of non-intervention in a Turkish-Axis conflict. Some Turkish quarters even hoped for Soviet aid against the Axis. This made it probable that the Turks would take a firmer stand against the German advance in the Balkans and the eastern Mediterranean in 1941.

**War Preparations.** Throughout 1940 the Turks repeatedly affirmed their determination to resist any power that attacked their borders, and extensive preparations were made to make good this pledge. Parliament on January 18 conferred far-reaching emergency powers upon the government under a National Defense Law, and these powers were placed in effect February 19. Expenditures for armaments were repeatedly increased. Hours of labor in factories engaged on defense contracts were raised from nine to 12 in the spring. The armed forces were steadily expanded. Plans for Turkish military collaboration with Britain and Greece were worked out. Air raid precautions were taken in Istanbul and other exposed cities. Numerous measures were taken, such as government control of all cereals and cereal prices, to place the economic system on a war basis.

The Turkish war preparations were materially aided by Allied credits and other assistance. An agreement signed with Britain and France Jan. 8, 1940, provided new loans of £25,000,000 and 264,750,000 francs, respectively, of which £25,000,000 was to be spent for armaments in Britain and France. An additional £2,000,000 was set aside to cover overdue payments to British exporters. Another £15,000,000, in gold, was received from the Allies late in January to stabilize the Turkish currency. These subsidies raised to about \$352,000,000 the aid advanced by the Allies in consideration of the Turkish alliance of Oct. 19, 1939. On Feb. 3, 1940, Turkey also concluded an advantageous trade agreement with Britain. Another Anglo-Turkish financial and economic accord was announced December 4.

**The Spring Crisis.** With the support of the Allies, Turkey sought early in 1940 to convert the Balkan Entente into an alliance designed to prevent either Soviet, German, or Italian penetration of the Balkans. It also attempted to bring Bulgaria into an agreement on this basis. On February 1 the Turkish Foreign Minister declared that Turkey "is not neutral but merely out of the war" and that it was "necessary to take all measures to prevent the flames from spreading." Rumania and Yugoslavia, however, were under strong pressure from the Axis and rejected the Turkish suggestion. The Turks took independent action on February 8 to curb German activities in Turkey. The German-owned Krupp shipyards on the Bosphorus were seized without warning and on February 9 100 German technicians employed in Turkish armament industries were dismissed.

Immediately afterward heavy reinforcements reached the Anglo-French armies in the Middle East and an acute crisis developed between Turkey and the Soviet Union. Moscow apparently feared that the Allies were preparing to cut off German oil supplies by a drive into the Russian Caucasus through Turkey, while the Turks feared a Soviet

attack. On February 21 hundreds of Russian technical experts employed in Turkish industries under a Soviet-Turkish agreement were suddenly called back to Moscow. Soviet trade and economic agencies in Turkey were closed. There were troops concentrations and some incidents along the Caucasus frontier, and on February 24 the Turkish Supreme Defense Council declared a state of emergency throughout the country. This crisis was tided over, apparently as a result of Turkish assurances to Moscow that Turkey would not enter the war on the side of the Allies without Russian consent.

Another Soviet-Turkish crisis developed in June when Moscow served its ultimatum on Rumania (q.v.). The Turks sent a naval squadron into the Black Sea on June 27 and made intensive preparations to meet an anticipated Soviet demand for control of the Straits. This situation was reversed when Rumania aligned itself with Germany and German troops entered Rumania, blocking a Soviet advance into Bulgaria and Turkey. Negotiations were opened for healing the breach between Moscow and Ankara, and these discussions were facilitated by Japan's adherence to the Axis on September 27. In view of the lessening of the Soviet threat, and the resurgence of British military and naval power in the Mediterranean area toward the end of the year, the Turks firmly resisted German diplomatic efforts, aided by economic inducements, to detach them from their British alliance and obtain their peaceful acceptance of the Axis-dominated "new order" in Europe.

See AFGHANISTAN, BULGARIA, GERMANY, GREAT BRITAIN, GREECE, IRAN, IRAQ, RUMANIA, SYRIA AND LEBANON, and UNION OF SOVIET SOCIALIST REPUBLICS, under *History*; COMMUNISM; EARTHQUAKES.

**TYPOGRAPHICAL UNION,** International. See AMERICAN FEDERATION OF LABOR.

**TYPOGRAPHY.** See NEWSPAPERS AND MAGAZINES.

**UBANGI-SHARI.** See FRENCH EQUATORIAL AFRICA.

**UGANDA.** A British protectorate in East Africa. Area, 93,981 square miles; population (1939), 3,745,165, including 3,725,798 natives, 17,256 Asiatics, and 2111 Europeans. Education (1938): 269,343 students attending schools of all kinds.

**Production and Trade.** Chief products: cotton (1,318,522 metric tons of cotton and 85,042 long tons of cottonseed exported during 1939), coffee, sugar, hides and skins, salt, tin, gold (15,281 oz. valued at £118,139 in 1939). Livestock (1937): 2,609,146 cattle, 2,541,077 goats, 1,405,549 sheep. Uganda and Kenya form a single unit for customs purposes. Trade (1939): imports (Kenya and Uganda), £8,942,436; exports (Uganda only), £3,956,047. In addition to the above there is an interchange of imported and locally produced goods among Kenya, Tanganyika, and Uganda.

**Government.** Finance (1938): revenue, £1,863,863; expenditure, £2,060,199; public debt, £2,235,600. The protectorate is administered by a governor who is aided by an executive council of 7 members, and a legislative council of 10 members (6 official and 4 nominated unofficial). Gover-

nor, Sir Charles Dundas (appointed July, 1940).

**History.** European and native troops from Uganda participated in the fighting along the Kenya-Italian East Africa frontier following Italy's entrance into the European War in 1940 (see *EUROPEAN WAR under Campaigns in Africa*). The war also brought about increased political and economic co-operation among Kenya, Tanganyika, and Uganda and the other British East African colonies. See *KENYA under History*.

**UNION NOW.** Federal Union, Inc. (formerly Inter-democracy Federal Unionists), Union House, 10 East 40th Street, New York City, sprang up early in 1939 to work for a union of free peoples, the nucleus of a democratic world government, as outlined by Clarence K. Streit in his book, *Union Now*, which suggested that a beginning be made by a federal union of the United States, United Kingdom, France, Eire, Canada, Australia, New Zealand, Union of South Africa, Norway, Sweden, Denmark, Netherlands, Belgium, Switzerland, and Finland.

Delegates of several local "committees of correspondence" met at Union House (then a two-room apartment), July 15, 1939, and set up national organizing and executive committees. A monthly magazine (now *Federal Union World*) already had appeared. A speakers' bureau was established.

The three major radio networks had invited Mr. Streit to speak. The Carnegie Endowment had distributed 1000 copies of *Union Now* to editors and international relations groups in universities. Speaking engagements carried Mr. Streit from coast to coast on the first of several long tours. Leading magazines brought home to millions the responsibility of unrestricted national sovereignty for an ungoverned world.

Early in 1940, the American Institute of Public Opinion estimated that 2,000,000 United States voters favored "Union Now" and 4,000,000 more a European federation.

The actual paid membership numbered approximately 5000 in December, 1940. There were also 60 chartered local chapters. Obviously, the principle of international federation—not new, but given an unprecedented impetus by "Union Now"—continues to run far ahead of organizational effort; and nothing comparable to federation, in prestige and proved efficiency, is being discussed

anywhere as a means of re-implementing international order.

By the close of June, 1940, Hitler had reduced the "original fifteen" democracies mentioned by Streit in his *Union Now*, to seven. Accordingly, Mr. Streit in July, 1940, launched a daring advertising campaign with a full page in *The New York Times*. These advertisements urged immediate provisional union with Britain and included a "Declaration of Inter-dependence." Thousands of "signers of the Declaration" came forward, and thousands of contributions were received. No money is accepted from any foreign source. Since Oct. 29, 1940, the proposal of immediate provisional union with the democracies of the British Commonwealth of Nations has been the official short-term policy of Federal Union, Inc.

Radio time was secured for a series of broadcasts by Robert Sherwood, Edmond Taylor, John Balderston, Clare Boothe, William Jay Schieffelin, Madame Genevieve Tabouis and other notables. Subsequently, addresses by Andre Maurois and Lewis Mumford, among others, were transcribed. By December, 1940, over 60 stations in 31 different States were devoting free sustaining time to this series.

A second book by Clarence Streit, *Union Now with Britain*, was announced by Harper's for early 1941 publication. Federal Union's first organized financial campaign, with a \$250,000 goal, was also announced, just before the close of 1940.

Officers of Federal Union, Inc., include Clarence K. Streit, chairman; E. W. Balduf, director; P. F. Brundage, secretary; John Howard Ford, treasurer; A. J. G. Priest of Reid and Priest, counsel. National Committee: Frank Aydelotte, P. F. Brundage, Russell Davenport, Henry S. Dennison, James E. Downes, Mrs. Richard T. Fisher, John Howard Ford, Mrs. Thomas W. Lamont, Gordon Mannerstedt, Arnaud C. Marts, Mrs. Grenville D. Montgomery, David S. Muzzey, Walter W. Pettit, A. J. G. Priest, Melvin Ryder, William Jay Schieffelin, and Clarence K. Streit. Nearly 200 distinguished men and women comprise the Council of Advisers.

Similar, wholly independent organizations exist in Great Britain, Eire, Canada, Australia, New Zealand, Argentina, and Switzerland.

**UNION OF SOUTH AFRICA.** See *SOUTH AFRICA, UNION OF*.

**UNION OF SOVIET SOCIALIST REPUBLICS (U.S.S.R.).** A state comprising the greater part of the former Russian Empire. Capital, Moscow.

**Area and Population.** The area as of Aug. 31, 1939, was about 8,200,000 square miles (73 per cent in Asia and 27 per cent in Europe). The census of Jan. 17, 1939, showed a population of 170,467,186 (88,802,205 females and 81,664,981 males), compared with 147,027,915 at the 1926 census. The urban population at the 1939 census was 55,909,908; rural, 124,557,278. In addition, there were added to the U.S.S.R. through the annexation of eastern Poland in September, 1939, about 75,650 square miles of territory and some 12,800,000 inhabitants, according to Soviet estimates, divided as follows: Western Ukraine, 41,650 square miles and 8,000,000 inhabitants; Western White (Byelo) Russia, 34,000 square miles and 4,800,000 inhabitants.

At the beginning of the European War, the Soviet Union was composed of 11 Union Republics which in turn included 22 autonomous republics and 9 autonomous provinces as well as lesser sub-

divisions. The various autonomous units represented the principal national groups in the Union, of which there were nearly 200. The subsequent addition of five members brought the number of the union republics up to 16. The five new members were formed mainly out of freshly acquired territories. For capitals, areas and populations of the 16 union republics, see accompanying table U.S.S.R.: *Constituent Republics and Populations*.

#### U.S.S.R.: CONSTITUENT REPUBLICS AND POPULATIONS

Republics	Capitals	Sq Kilometers	Populations
1.—Created before 1939			
Russian S.F.S.R. . . . .	Moscow	16,510,500	109,278,614

\* Without estimate of inhabitants remaining in ceded Finnish area

The populations of the 29 leading cities at the 1926 and 1939 censuses, with the percentage increases for that period, were as follows:

#### POPULATIONS OF CITIES. 1926 AND 1939

City	Dec. 17, 1926	Jan. 17, 1939	1939 in % of 1926
Moscow . . . . .	2,029,425	4,137,018	203.9
Leningrad . . . . .	1,690,065	3,191,304	188.8
Kiev . . . . .	513,637	846,293	164.8
Kharkov . . . . .	417,342	833,432	199.7
Baku . . . . .	453,333	809,347	178.5
Gorky . . . . .	222,356	644,116	289.7
Odessa . . . . .	420,862	604,223	143.6
Tashkent . . . . .	323,613	585,005	180.8
Tbilisi . . . . .	294,044	519,175	176.6
Rostov-on-Don . . . . .	308,103	510,253	165.6
Dnepropetrovsk . . . . .	236,717	500,662	211.5
Stalino . . . . .	174,230	462,395	265.4
Stalingrad . . . . .	151,490	445,476	294.1
Sverdlovsk . . . . .	140,300	425,544	303.3
Novosibirsk . . . . .	120,128	405,589	337.6
Kazan . . . . .	179,023	401,665	224.4
Kuibyshev . . . . .	175,636	390,267	222.2
Saratov . . . . .	219,547	375,860	171.2
Voronezh . . . . .	121,612	326,836	268.7
Yaroslavl . . . . .	114,277	298,065	260.8
Ivanovo . . . . .	111,460	285,069	255.8
Archangel . . . . .	76,774	281,091	366.1
Omsk . . . . .	161,684	280,716	173.6
Chelyabinsk . . . . .	59,307	273,127	460.5
Tula . . . . .	155,005	272,403	175.7
Minsk . . . . .	131,803	238,772	181.2
Vladivostok . . . . .	107,980	206,432	191.2
Stalinak . . . . .	3,894	169,538	4,353.8
Kirov . . . . .	62,097	143,181	230.6

**Education.** During the two decades ending in 1937, illiteracy was reported to have declined from 67.7 per cent to less than 8 per cent. In the academic year 1940-41, pupils attending elementary and secondary schools numbered about 36,765,000. There were about 1,200,000 students in technical schools and workers' faculties; about 1,800,000 children in nurseries and kindergartens, exclusive of 5,700,000 children placed in collective farm nurseries and kindergartens during harvest season; and 550,000 or more students in 781 universities and colleges. In the spring of 1938, 106,700

students were graduated from schools of higher education and 160,000 new students enrolled in universities. There were 563,000 teachers appointed to elementary and secondary school positions in the R.S.F.S.R. alone in 1938. Education is a charge against each of the 16 Union Republics and against the localities concerned. Expenditures on education, 23,326 million rubles for 1940, exceeded by one-eighth those for 1939.

**Production, etc.** In the Soviet Union transport and communications are conducted as Federal departments. Banking is centralized in a State Bank under government control. Distribution is socialized, with retail trade in the cities conducted mainly by local administrative bodies and in the villages by consumer co-operatives. Industrial production is carried on largely by State enterprises, operating under the general direction of appropriate Commissariats (government departments). A State Planning Commission (Gosplan) plots the objectives for each year and for five-year periods. An Economic Council acts as a co-ordinative body. An organization in the Commissariat of State Control checks and supervises results.

State planning is an essential of Soviet economy. The planning system is designed to direct and co-ordinate the employment of the energies and resources of the country for orderly development. The planning system, however, goes beyond the economic field. It includes science, education, public health, and the extensive social services designed to safeguard the welfare and security of the citizenship.

Under this system the work of Gosplan has assumed a position of primary importance. Its personnel in Moscow includes a considerable number of permanent specialists re-enforced by consultants who are authorities in every field. Under the central body each Constituent Republic has its Gosplan, and there are subordinate planning boards in the various cities.

The third Five-Year Plan (see 1938 YEAR BOOK for programs of first and second Five-Year Plans) was begun Jan. 1, 1938. Schedules for the first year envisaged an increase in the industrial output of 155 per cent and commensurate increases in other lines.

**Industry.** Year-to-year increase in industrial production was thus reported: 1939, 14.7 per cent; 1938, 11.3; yearly total industrial production, 137½ billion rubles for 1940, as against 95½ for 1937. Output of 162 billions was intended for 1941. The output of the chief industries in 1938 was: Electric power, 132,600,000,000 kilowatt-hours; coal, 132,900,000 metric tons; peat, 26,450,700 metric tons; oil, 32,230,000 metric tons; pig iron, 14,600,000 metric tons; steel, 17,700,000 metric tons; cement, 5,696,000 metric tons; trucks, 184,000 units; tractors, 32,200 units; cotton cloth, 3,491,000,000 meters; woolen goods, 114,000,000 meters; footwear, 213,000,000 pairs; sugar, 2,500,000 metric tons. Average daily carloadings were 88,000 cars. For comparative figures for 1935, 1936, and 1937, see 1938 YEAR BOOK, p. 737.

**Agriculture.** Since 1928 the structure of agriculture has been completely reorganized. The small, individual peasant holdings, averaging 12 to 14 acres, have in large measure given way to large-scale collective farms in which the peasants pool their acreage. (Each collective farm family, however, has its own garden plot and domestic farm animals.) This new set-up has made possible better organized methods of production with a high degree of mechanization. The transition was

effected largely during the years 1929-33. In 1929 less than 4 per cent of the peasant households were represented in the collective farms; by Jan. 1, 1938, the percentage had risen to 93.5. There were 244,000 collective farms averaging about 1200 acres in 1938. Some 800,000 peasant households still worked individual holdings. In addition, large State farms operated about 12 per cent of the sown area.

For 1940 the total area sown to crops was reported as 152,662,000 hectares; the harvest of grain, as 121,600,000 metric tons. For comparison with earlier years, see accompanying table *Sown Area and Grain Harvest*.

#### SOWN AREA AND GRAIN HARVEST

	Area of all crops (hectares*)	Area of grain crops (hectares*)	Grain production (metric tons)
1913 . . .	105,000,000	94,400,000	80,100,000
1931 . . .	136,300,000	104,400,000	69,480,000
1936 . . .	133,800,000	102,400,000	82,700,000
1937 . . .	135,300,000	104,400,000	120,290,000
1938 . . .	139,900,000	102,400,000	94,900,000

\* Hectare equals 2.47 acres.

Grain exports, in metric tons, averaged 10,553,000 annually for the years 1909-13 and were 5,057,000 in 1931, 332,000 in 1936, 1,278,000 in 1937, and 2,080,000 in 1938.

#### PRINCIPAL INDUSTRIAL CROPS

		1936	1937	1938
Cotton	met tons	778,100	854,600	840,000
Sugar beets	do	16,830,000	21,860,000	16,680,000
Flax	do	580,000	570,000	546,000

The backbone of mechanization in Soviet agriculture is furnished by the machine and tractor stations, each of which serves collective farms within its area. These stations grew from 158 in 1930 to 6350 in 1938. The number of tractors on farms increased from 66,332 in 1929 to 483,500 in 1938; the number of combines, from 45 in 1929 to 153,500 in 1938.

**Transportation.** Length of railway lines in 1937 was 53,700 miles, nearly 50 per cent greater than in 1913. Railway freight carried in 1940 was reported to have attained 409 billion ton-kilometers; passengers, 1,178,000,000 persons. The length of Soviet air lines in 1937 was 79,250 miles; in that year they carried 235,000 passengers and 46,900 metric tons of mail and freight. See *ROADS AND STREETS* for highways. The length of inland waterways is about 248,000 miles, of which 65,826 miles are navigable. In 1938 they carried 66,600,000 metric tons of freight (66,900,000 in 1937).

**Shipping.** The Soviet merchant marine had a gross tonnage of 1,280,900 on June 30, 1938 (1,258,200 on June 30, 1937). The total freight carried (including coastwise freight) amounted to 35,500,000 metric tons in 1937. See *SHIPPING*.

**Foreign Trade.** The Soviet Union exported to the United States, in the calendar year 1940, merchandise to the value (U.S.) of \$22,274,000 and imported from the United States \$82,092,000. The Soviet Union's total yearly exports and imports of 1938 and earlier appear in an accompanying table. Foreign commerce in the Soviet Union is a governmental monopoly exercised by the Commissariat of Foreign Trade which maintains trading agencies abroad. Imports and exports are regulated in accordance with the country's system of planned economy.

Exports and imports of 1938, to and from chief

countries: Great Britain, 375,124 and 240,309 thousand rubles, respectively; United States, 96,749, and 405,858; Germany, 88,327 and 67,193; China (except Mongolia), 44,148 and 68,461; Netherlands, 92,848 and 102,535.

#### SOVIET FOREIGN TRADE

Year	Imports (1,000 rubles*)	Exports (1,000 rubles*)	Imports (\$1,000 <sup>b</sup> )	Exports (\$1,000 <sup>b</sup> )
1935 . . .	1,057,200	1,609,300	209,264	318,534
1936 . . .	1,352,535	1,359,104	270,507	271,821
1937 . . .	1,341,255	1,728,634	268,251	345,727
1938 . . .	1,422,882	1,331,927	261,757*	250,751

\* In rubles nominally equal to 20 U.S. cents. <sup>b</sup> U.S. currency dollars. \* Provisional

**Finance.** In a country as highly socialized as the Soviet Union the growth of the budget reflects to a large extent the degree of economic progress. The first "firm" budget, that of 1924-25, balanced at 32,700,000 rubles. For the calendar year 1941, in millions of rubles, revenue was estimated at 216,200 and expenditure at 215,400, including 70,900 for defense; for 1940, revenue at 183,954, expenditure 179,913, defense 57,066; for 1939, revenue 155,607, expenditure 153,100, defense 40,885. The State Bank, only bank of issue and center of the financial system, had 16,000,000 depositors with deposits of 4,500,000,000 rubles on Dec. 1, 1937.

**Government.** Under the Constitution of 1936 supreme political power is vested in the Supreme Soviet of the U.S.S.R., meeting twice a year, and elected for a period of four years by universal direct suffrage and with secret ballot. The Supreme Soviet consists of two legislative chambers with equal rights. The two chambers in joint session elect a Presidium of the Supreme Soviet consisting of 37 members, including a president, 16 vice-presidents, and a secretary, with wide administrative powers between sessions of the Supreme Soviet, including ratification of treaties and declaration of a state of war. The Presidium supervises the work of the Council of the People's Commissars, selected by the Supreme Soviet, which acts as the executive and administrative organ of the State.

Generally considered the most powerful personality in Russia, Joseph Stalin, general secretary of the Communist party of the U.S.S.R., is a member of the Presidium of the Supreme Soviet and of the Supreme Military Council. The Communist party is the only legal political party, and all candidates for elective office must have its approval. The Council of People's Commissars (All-Union) was composed as follows at the end of 1940: Chairman and Commissar for Foreign Affairs, Viacheslav M. Molotov; vice-chairman, also chairman of the Defense Committee, Klementi E. Voroshilov; Commissar of Defense, Semyon Timoshenko; Foreign Trade, Anastase I. Mikoyan; Railways, Lazar M. Kaganovich; Communications, Ivan T. Peresipkin; Sea Transport, Semen S. Dukelsky; River Transport, Zosim A. Shashkov; Electric Power Stations, Andrei Letkov; Electrical Industry, Vassili Bogatyrov; Ferrous Metallurgy, Ivan Tevosyan; Non-Ferrous Metallurgy, Petr Lomako; Chemical Industry, Mikhail F. Denisov; Aeronautical Industry, Shakhurin; Shipbuilding, Ivan Nosenko; Munitions, Ivan P. Sergeyev; Armaments, Boris L. Vannikov; Heavy Machine Building, Alexander Efremov; Medium Machine Building, Ivan A. Likhachev; General Machine Building, Peter I. Parshin; Navy, Niko-

Iai G. Kuznetsov; Procurement, Sergei E. Skrinikov; Construction, Semen Z. Ginzburg; Oil Industry, Ivan Sedin; Coal Industry, Vasily V. Vakhrushev.

Other People's Commissars and officials were: Food, Vassili P. Zotov; Fisheries, Alexander Ishkov; Meat and Dairy Products, Pavel V. Smirnov; Light Industry, Sergei G. Lukin; Textiles, Ilya Akimov; Timber, Fedor Sergeyev; Agriculture, Ivan A. Benediktov; State Grain and Livestock Farms, Pavel P. Lovanov; Finance, Arseni G. Zverev; Trade, Alexander Lubimov; Internal Affairs, Lavrenti P. Beria; State Security, Fedor Merkulov; Justice, Nikolai Richkov; Public Health, Georgi A. Miterev; Building Materials, Leonid A. Sosnin; Paper and Cellulose, Nikolai Cheboratev; Chairman of the Presidium of the Supreme Soviet, Mikhail Kalinin; Chairman of the State Planning Commission, Saburov; Chairman of the State Bank Administration, Nikolai Sokolov; Commissar of State Control, Lev Mekhlis; Chairman of the Supreme Court, Ivan T. Golyakov; Procuror, Victor Bochkov.

### HISTORY

**Russia and the European War.** The year 1940 witnessed a gradual transformation in Soviet foreign policy from active diplomatic and economic collaboration with Germany to indirect opposition and veiled hostility. This change was dictated by the world-shaking military and political developments in Europe that left Hitler the virtually undisputed master of the Continent; also by the extension of the Rome-Berlin military alliance on September 27 to include Tokyo. Moscow was thus faced with the danger of a concerted attack by Germany and Japan, supported by Italy and other Fascist powers, once Britain was defeated. Moreover the Axis advance in the Balkans, which made rapid headway after the German victories on the Western Front, excluded the Soviet Union from an area traditionally under strong Russian influence, and threatened to block Russia's outlet to the Mediterranean through the Straits.

These developments led Moscow during the latter half of 1940 covertly to encourage Balkan resistance to Nazi Germany's "new order" in Europe, while continuing limited economic co-operation with the Reich. The Soviet Government sought, without openly antagonizing Hitler, to prolong the European conflict and thus weaken Germany and Britain so that neither could threaten Russia nor effectively oppose the expansion of communism.

**The Allied Threat.** As a result of the German-Soviet non-aggression pact of Aug. 24, 1939, the Soviet Government early in 1940 found itself in imminent danger of embroilment with the Allies. By the Soviet-German pact, Moscow had succeeded in diverting German military power westward against Britain and France. It had seized half of Poland without participating in the European conflict, and had obtained from Hitler the free hand for expansion in the Baltic States that the Allies had been unwilling to grant. With German assent, the Russians had extorted Baltic naval and air bases from Estonia, Latvia, and Lithuania and made similar demands upon Finland. Finland's rejection of these demands provoked the Russian invasion beginning Nov. 30, 1939 (see *YEAR BOOK*, 1939, p. 773 f.). The Russo-Finnish War, which revealed unexpected weaknesses in Soviet military organization and leader-

ship, was still in progress at the beginning of 1940.

Hoping to obtain a foothold in Scandinavia for a flank attack upon the Reich, as well as to check Soviet expansion to the North Atlantic, the Allied Governments early in 1940 attempted to secure Norwegian and Swedish consent to the dispatch of an expeditionary force to aid Finland. They also sent substantial quantities of war supplies to the Finns. At the same time, the Allies brought pressure upon Russia, which constituted the greatest leak in the Allied blockade of Germany, to curtail shipments of food, oil, and other vital supplies to the Reich. Moreover strong Anglo-French forces were concentrated in Syria, Palestine, and Egypt. Moscow feared that these forces might, with Turkish support, launch a drive into the Caucasus oil fields in order to cut off Soviet oil shipments to Germany.

**Peace with Finland.** The danger of being forced into a reluctant war partnership with the Reich explained Moscow's readiness to end the struggle with Finland, even after the shattering of the Mannerheim Line had exposed the exhausted Finnish armies to complete destruction (see *EUROPEAN WAR under The Finnish Campaign; FINLAND under History*).

The peace treaty of March 12 gave the Russians the strategic positions and bases they had previously demanded from Finland, as well as several slices of Finnish territory. With the exception of a small area added to Leningrad, this newly acquired territory on Mar. 31, 1940, was added to the Karelian Soviet Socialist Republic. The latter republic was then renamed the United Karelo-Finnish Socialist Republic and raised to the status of a constituent member of the Union. The so-called Terijoki Government, the puppet regime recognized by Moscow on Dec. 1, 1939, as the government of all Finland, was repudiated for the time being. However the Soviet Government demonstrated by its subsequent pressure upon Finland (q.v.) that it had not abandoned hope of bringing the entire country under Soviet domination.

**Effect of German Victories.** The Soviet press justified the German invasion of Denmark and Norway in April, since this ended the threat of Allied intervention in Scandinavia and temporarily exposed Finland to the full weight of Soviet pressure. Moscow likewise tacitly approved of the German attack upon the Low Countries in May. But the sensational German victories in Belgium and France, the collapse of France, and the prospect of an early British capitulation shattered the Kremlin's belief in a long and exhausting Allied-German struggle. The quick German triumph eliminated all danger to the Soviet Union from the Allies for the time being. But it confronted Moscow with an all-powerful Reich, free to employ formidable armies for the "drive to the east" that Hitler had forecast in *Mein Kampf*. All the small anti-Soviet States of eastern and northern Europe—Finland, Slovakia, Hungary, Rumania, Bulgaria, and even Sweden—openly or tacitly threw in their lots with Germany to avoid the fate of Norway, the Netherlands and Belgium and as an alternative to acceptance of Soviet "protection" and domination.

**Rumanian Territories Annexed.** The Soviet Government hastened to seize the seemingly short interval before British resistance would be crushed to improve its strategical and military defenses against the Reich. Initiation of the Franco-German armistice on June 25 was followed immediately by a Soviet ultimatum to Rumania, de-

manding the return of Bessarabia and the cession of Northern Bukovina. The Rumanian Government, fearing a simultaneous attack by Hungary and Bulgaria, yielded on June 28. On July 1 Russian troops occupied the ceded territories.

In some places the Red Army pressed beyond the boundaries of the newly occupied provinces. Clashes with Rumanian forces took place and Soviet occupation of the entire kingdom appeared imminent. This was averted by the establishment of a Nazi regime in Rumania and by German, Italian, and Hungarian opposition to a further Russian advance, confirmed later by an Axis guarantee of the new Soviet-Rumanian frontier. Thus in Rumania German and Soviet ambitions came into open collision for the first time since the conclusion of the Soviet-German pact. See *RUMANIA under History*.

The major part of Bessarabia was merged with the Moldavian Autonomous Soviet Socialist Republic on August 2 to form the Moldavian Soviet Socialist Republic. The remainder of Bessarabia, together with Northern Bukovina, was incorporated in the Ukrainian Soviet Socialist Republic.

**Absorption of Baltic States.** Meanwhile the Soviet Government proceeded with the subjugation of the Baltic States—Estonia, Latvia, and Lithuania—for which the groundwork had been prepared in the autumn of 1939. Demands for the free passage of Russian troops and the formation of pro-Soviet governments were made on June 16-17. Without waiting for acceptance of these demands, the Red Army overran the three unresisting countries. Communist-dominated governments were set up which repressed all anti-Soviet elements and on July 14-15 held controlled elections. These produced pro-Soviet parliaments, pledged to the incorporation of the three republics into the Soviet Union. Lithuania, Latvia, and Estonia were admitted into the U.S.S.R. as constituent republics by decrees of August 3, 5, and 6 respectively. In September, all three republics were merged into one military district. See *ESTONIA, LATVIA, and LITHUANIA, under History*, for full details.

**Negotiations with Britain and United States.** These territorial annexations by the Soviet Union inflamed anti-Soviet sentiment in Britain and the United States, and produced new tensions in their relations with Moscow. Both countries "froze" the securities owned by the subjugated Baltic countries and their citizens, and detained some 40 ships under Estonian, Latvian, and Lithuanian registry, which were in British and American ports at the time of the Russian military occupations.

Acting Secretary of State Sumner Welles on July 22 publicly denounced the Soviet Government's action, declaring that the independence and territorial integrity of the Baltic countries had been "deliberately annihilated" by "devious processes." Premier Molotov responded on August 1 by attacking the "freezing" of Baltic properties in the United States as illegal. Reaffirming Russia's claim to all Baltic properties, he accused the United States of "imperialist designs" on British and other European possessions in the Americas.

Despite their suspicion and hostility toward Soviet policy, both the British and American governments sought to win Soviet co-operation in restraining further German expansion in the Balkans and Japanese expansion into Southeastern Asia. These discussions were carried on throughout the latter part of the year in Moscow, Washington, and London without producing decisive re-

sults beyond Russia's refusal to accept Hitler's offer of full participation in the Axis program for a new world order. See *GREAT BRITAIN under History*.

Meanwhile on August 6 the Soviet-American commercial agreement of Aug. 4, 1937, was extended for still another year. The Soviet Government undertook to purchase American goods to the value of at least \$40,000,000 during the ensuing 12 months. The United States reserved the right to restrict export of items needed in connection with its rearmament program. However Washington subsequently permitted the export to Russia of some machine tools and also authorized the chartering of some American tankers to the Soviet Government.

**Axis Inducements.** Germany and Japan entered into competitive bidding with Britain and the United States for Soviet diplomatic and economic support. The Germans offered territorial concessions to Russia, reportedly at the expense of Turkey, Iran, Afghanistan, and the British Empire, for Soviet co-operation or neutrality during an Axis drive into the Balkans and during a Japanese attack upon British, French, and Dutch possessions in Southeastern Asia. The German offer was reinforced by the shifting of a large part of the German army from Western Europe to Rumania during October. The Russo-German negotiations were climaxed by the visit of Premier Molotov to Berlin at Hitler's invitation on November 12-14. For the Russo-Japanese negotiations, see *CHINA and JAPAN under History*.

Subsequent developments indicated that the Soviet leaders had refused to commit themselves to participation in the Axis program, beyond some intensification of economic interchange agreed upon in a new trade pact signed late in the year. At the same time agreement was reached for the transfer to Germany of the remaining German-speaking inhabitants of the Baltic States and for the exact definition of the Russo-German border from the Baltic to the Hungarian frontier. In December Berlin officials declared Soviet-German trade had regained the 1930 peak.

The true state of Axis-Soviet relations was reflected more accurately in the Soviet diplomatic intervention in Sofia in November to prevent Bulgarian adherence to the Axis, the encouragement given the Turks by Moscow to resist German pressure, and the announcement in December that there would be no change in Soviet support of the Chinese Nationalist cause (see *BULGARIA and TURKEY under History*).

**War Preparations.** While seeking to avoid involvement in the European War by playing off the rival capitalist and Fascist powers against one another, the Soviet Government made feverish preparations both for further territorial expansion and for defense against a possible "capitalist" attack. On the 23rd anniversary of the Bolshevik revolution on November 7, the Soviet War Commissar, Marshal Timoshenko, declared that while the Soviet Union had extended its borders "we cannot be contented with what has been achieved." Another call for "eternal vigilance," greater armaments and improved discipline as the direct path to world communism came from President Kalinin of the Supreme Council of the Soviet Union. He described the Soviet Union as a "besieged fortress" covering one-sixth of the world, with the remaining five-sixths controlled by "our principal and irreconcilable enemies."

Extraordinary measures were taken to remedy

the defects in the Red Army revealed by the Finnish war, to increase production of military and other supplies, and to tighten the discipline of the Communist party and of both the military and civilian populations. The election of some 600,000 local and minor officials of the Communist party in February and March gave Joseph Stalin and his adherents a further opportunity to weed out lukewarm supporters and anti-Stalinists (see COMMUNISM under *Changes in Soviet Union*). A decree of April 7 provided for obligatory deliveries of agricultural crops to the government on the basis of acreage rather than of the area sowed—a step intended to increase production. A reorganization of the Economic Council was undertaken April 17 to spur lagging industries.

On May 8 Marshal Voroshilov was replaced as Defense Commissar by Marshal Semyon Timoshenko and demoted to the post of assistant chairman of the Council of People's Commissars. At the same time the officers of the Red Army and Navy were given enlarged powers, the political commissar system in the armed forces was again abandoned, and "familiarity and false democratization" between officers and men was discouraged. Early in August decrees for the enforcement of stricter labor discipline were issued. The head of the Soviet judicial system ordered the ousting of all judges who did not mete out strict justice to idle, unco-operative and transient workers in Soviet factories. A decree of October 3 inaugurated the annual mobilization for industrial training of more than 800,000 youths "for the purpose of establishing State labor reserves for industry." Despite these measures and many others of a similar character, correspondents and travelers in Russia reported continuance of the disorganization and serious shortages of food and consumers goods that had prevailed in previous years.

**UNIONS.** See **AMERICAN FEDERATION OF LABOR**; **CONGRESS OF INDUSTRIAL ORGANIZATIONS**; **LABOR CONDITIONS**.

**UNITARIANS.** A religious denomination, founded in England in the late 18th century, which holds belief in one God in one person as opposed to the Trinity. Headquarters, 25 Beacon Street, Boston, Mass. For statistics, see **RELIGIOUS ORGANIZATIONS**.

**UNITED BRETHREN.** A term used for three religious denominations in the United States, all originating in the evangelistic movement of William Otterbein and Martin Boehm about 1800. The largest body is the Church of the United Brethren in Christ with headquarters in Dayton, Ohio. See **RELIGIOUS ORGANIZATIONS**.

**UNITED KINGDOM OF GREAT BRITAIN AND NORTHERN IRELAND.** See **GREAT BRITAIN**; **IRELAND, NORTHERN**.

**UNITED STATES.** The area of the United States proper, or the 48 States and the District of Columbia, is 3,026,789 square miles; this excludes open sea and parts of the Great Lakes lying nevertheless within the territorial limits; it does include 53,013 square miles of other waters. The non-contiguous lands subject to the authority of the United States (Alaska, Hawaii, the Philippine Islands—autonomous but not yet independent, the Panama Canal Zone, Puerto Rico, Guam, the Virgin Islands, and American Samoa) comprise 711,-

606 square miles. The combined area of the Union and these lands was 3,738,395 square miles.

Note: The United States also possesses, or claims possession of, the following Pacific islands: Baker, Howland, and Jarvis Islands, fringing the equator in mid-Pacific about 1000 miles S.S.W. of Honolulu (U.S. aerologic stations were established on all three islands in 1936 and an emergency airfield on Howland Island in 1937), Johnston Island (q.v.), Midway Islands (q.v.), Palmyra Island (q.v.), and Wake Island (q.v.) Canton Island (q.v.) and Enderbury Island are under joint Anglo-American administration.

The population of the United States (Sixteenth Census) April, 1940: 131,669,275. April, 1930 (Fifteenth Census): 122,775,046. For populations of individual States, see articles on the several States, Territories, and Possessions. For populations of other cities and of urban places of over 5000, see **POPULATION OF THE UNITED STATES**.

The slackening rate of increase in the numbers of the Nation deserved particular note. From 1930 to 1940 the population rose by only 7.1 per cent, as against 16.1 per cent from 1920 to 1930. The rate (1930-40) fell below half that of any previous recorded gain in the decennial census. Only 12 States, five of them in the South, gained at a higher rate than in the previous decade. The shrinkage in the rate of increase particularly affected many States that had made great efforts to aid the less independent of their people by free education and other favoring policies. The approach of an era of stationary or possibly of diminishing population formed a subject of serious though, of course, uncertain prediction.

The Bureau of the Census enumerated the people as to their condition with regard to employment in the last week of March, 1940. Its results, still subject to some alteration, showed a population aged 14 years or over, of 100,972,196. Of these, 52,840,762 were the "labor force" (those at work or seeking it), and of these, 45,350,430 were performing work other than "public emergency work." In "public emergency work" (i.e. occupation provided by the WPA, NYA, and CCC in order to support individuals) were numbered 2,380,062; and those having no work and seeking employment totaled 5,110,270. The remainder of the population 14 years old and over, not apparently at work or seeking it, numbered 48,141,434. Of the "labor force," 39,994,197 were males and 12,846,565 were females; respective numbers in ordinary work, 34,201,490 and 11,148,940; on "public emergency work," 1,947,975 and 432,087; seeking work, 3,844,732 and 1,265,538.

This was the first comprehensive and official census to show the number of the unemployed, over which dispute and conjecture had gone on since the early years of the economic collapse.

**Agriculture.** See **AGRICULTURE** and the articles

there referred to on crops, government agencies, etc.

**Commerce.** See BUSINESS REVIEW; INTERSTATE COMMERCE COMMISSION; TRADE, FOREIGN.

**Communications.** See POST OFFICE; RADIO; TELEGRAPHY; TELEPHONY.

**Defense.** See DEFENSIVE PREPARATIONS; DRAFT, MILITARY; MILITARY PROGRESS; NATIONAL DEFENSE ADVISORY COMMISSION; NAVAL PROGRESS.

**Education.** See EDUCATION; SCHOOLS; UNIVERSITIES AND COLLEGES; and the section on *Education* in the articles on the States.

**Finance.** See PUBLIC FINANCE; TAXATION; and below under *Legislation*.

**Judiciary.** See COURTS; LAW; SUPREME COURT.

**Manufacturing.** See BUSINESS REVIEW; the section on *Manufacturing* in the articles on the States.

**Mineral Production.** See the articles on leading minerals; MINES, BUREAU OF; BUSINESS REVIEW; and the section on *Mineral Production* in the articles on the States. The value of the production of all minerals in the United States was estimated for 1940, by the U. S. Bureau of Mines, as approximating \$5,600,000,000; this exceeded by some 15 per cent the value of 1939's production of \$4,874,000,000. The main subtotals follow: production of metals, \$1,650,000,000 for 1940 (28 per cent above 1939's production of \$1,291,000,000); production of fuels, \$3,100,000,000 for 1940 (10 per cent above 1939's production of \$2,818,600,000); production of other minerals, \$850,000,000 (11 per cent above 1939's production of \$764,400,000).

**Transportation.** See AERONAUTICS; RAILWAYS; ROADS AND STREETS; SHIPPING.

#### ADMINISTRATION

**General Conditions.** Two occurrences in 1940 greatly affected the conditions of the people's thought, of the social relations, and of economics and thus bore upon the direction of the Nation's course. The first of these occurrences was the German conquest of the greater part of western Europe; the second was the National election. Germany overcame France in June. It was the season at which National campaigns start. The conjunction of these two facts made possible a redirection of public opinion away from the mere familiar record of the New Deal into a fresh and emotionally stirring realm in which many things were to be changed in order to put the country in a posture to meet the conceived peril of a foreign attack.

Features of common thought, while the year shaped itself, were a rising antagonism to Germany, evident, among other ways, in the renewal of a certain good will for Russia, which in early 1940 had been condemned for overpowering and despoiling Finland but which later shone forth as the possible preventer of a German march to the Dardanelles; a ready acceptance, in events at home, of ways strange to a time of literal peace, so far as the Nation was concerned; acquiescence in the much-repeated adjuration that the "American way" must be preserved at all cost; an evaporation of the view, from many minds, that European wars must "never again" involve the United States; a shrinkage of interest in partisan politics; and a less critical attitude among many previously opposing the Governmental policies.

In the social relations the popular antagonism to Communists developed formidably, a number of

States excluding the Communist candidates from the ballot, for the movement came to be viewed as the mainspring of sabotage against the Nation. (See COMMUNISM.) Aliens, too, came under suspicion, being obvious objects for the exercise of rising Nationalist sentiment. The youth of the nation, which had seemingly in previous years lent much attention to the organized and habitually unsatisfied youth movement, fell into step with the rest of the people, accepting with little demur the heavy claim upon it made by the draft. The incidents of class warfare became fewer and, in particular, the labor unions, having an opportunity in the intense efforts of many industries to provide the tools of war, hesitated up to the end of the year to adopt the inviting if dangerous plan of repeating in the armament industries what had been accomplished in manufactories of automobiles and of steel. (See LABOR CONDITIONS.)

In the field of economics times improved consistently, so far as concerned employment. The financing of additions to establishments having contracts for armament, accomplished largely with credit from the Government or its agencies, drew remarkably little upon the resources of the ordinary banks, so that the rates for loans remained, as they had stood for some years, abnormally low by old standards. Whether from the public's loss of ambitions and hopes of enrichment or from uncertainty as to the prospects of it, the markets for securities as a whole responded but mildly to what in certain other respects somewhat resembled a war boom, and the exchanges sold fewer securities than in any of the three previous years. (See BUSINESS REVIEW; FINANCIAL REVIEW.)

The President, President Roosevelt achieved in 1940 two surpassing successes. The more obvious one was his unprecedented election to serve for a third term, shattering the two-term tradition that had withstood two earlier Presidents and had remained inviolate since 1797. Less obvious but perhaps more evidential of his abilities was his safe passage from the role of tribune of the poor against the rich in an often bitter civil strife for the redistribution of the means of living to that of leader of a united people toward utmost preparedness for a possible war with a foreign enemy.

The year's first weighty Presidential utterance, the annual message to the convening session of Congress, was delivered by Mr. Roosevelt on January 3: it contained an exhortation to National unity—a theme that reappeared in his words to the popular ear throughout the year—and also a disavowal, before the fact, of the policy of using the unemployed to produce huge armaments. In the passage on National unity occurred the words: "Doctrines which set group against group, faith against faith, race against race, class against class, fanning the fires of hatred in men too despondent, too desperate to think for themselves, were used as rabble-rousing slogans on which dictators could rise to power. And once in power, they could saddle their tyrannies on whole nations"; such expressions gave newspapers the chance to cite previous words from the same mouth, branding the rich as Tories, copperheads, and economic royalists and comparing their estate with that of an ill-fed, ill-clad, and ill-housed third of the population. Nevertheless it was the new utterance and not the older ones, that won attention. The utterance as to armaments was "We refuse the European solution [for unemployment] of using the unemployed to build up excessive armaments which eventually result in dictatorships." It occurred in the course of

a discussion of the persistence of unemployment, a trouble destined to dwindle later in the year by very reason of the administration's resort to the greatest and quickest practicable increase of armaments. The message as a whole dealt mainly with the conceived effects of the threatened anti-liberal outcome of the war in Europe as likely to disturb the future of the United States, and it preached the need of a united mind for facing the situation. But also, it wove into the newer appeal features of the older Rooseveltian doctrine: the need, by Federal authority, to increase the income of the population was again mentioned; the intent to deal more of this income to the class least provided with it reappeared in the guise of a way to strengthen the Nation against peril from without. In the budget message appeared anew, and on the verge of a season of unparalleled peacetime appropriation and huge increase in taxation, a solicitude for economy: the original budget for the ensuing fiscal year set expenditure \$675,000,000 below the then-estimated total for the fiscal year current and recommended additional taxation to bring in \$460,000,000 for the gradual extinction of the cost, already much beyond normal, of the military and naval establishments; these changes, with the aid of some \$700,000,000 of credit-granting agencies' "excess" of capital funds, to be cross-entered to the Treasury's resources, were to bring the deficit for the fiscal year 1941 down to \$1,716,000,000.

**The President and German Conquests.** In the spring the German army, after many months of a deceptively eventless war of position on the Western Front, started war of movement; by the middle of June it held in unresisted control the western coast of Europe from the Arctic circle to the Spanish border. This overturn of the structure of the European continent, affecting in some degree nearly all of the world's concerns, affected the President's situation and policy as no foreign event had affected any of his predecessors.

It opened to him the possibility or, as many held, the need of his sinking all other roles in the role of defender of the Western Hemisphere; as the alternative, it exposed him to the risk of discredit, should the people conceive him to have done too little in that role or acted not early enough. Such discredit could, in the approaching election, sweep away the whole result of his years in the White House; but to play the newly offered role successfully could well rank him high among the few Presidents to whom fate had dealt a savior's part. The move that would preserve him from the charge of failure to cope with the conceived peril from Europe happened to be the very move to win him general recognition as the central figure in the protection of the United States and the other republics of the New World: he must take the lead in declaring peril and acting against it. Such was the course that he adopted. It involved letting those who had charged him, for over a year, with maneuvering the Nation toward a war play their trump for what it might be worth; it also invited the query, which Republicans duly put in the autumn, why he had not forecast the tempest nor prepared against it before it came near. It also dictated his making an innovation in American government by running and serving for a third term of office, braving not only the explicit condemnation that his own party had once declared for such a course, but also the latent mistrust of a republic for any move toward permanent tenure of supreme office.

Details of the course that Mr. Roosevelt took

in his third-term candidacy will be found in the article ELECTIONS, U.S. NATIONAL. His part in the creation of the policy of increasing armament is set forth in DEFENSIVE PREPARATIONS OF U. S., and in DRAFT, MILITARY. The manner in which the supplying of material of war to Great Britain was effected appears in the present article, under *Foreign Affairs*. Let us note here, however, the relations of the President's steps in these several fields, as to time. On May 16 he spoke to Congress a special message beginning, "These are ominous days," and proposing that the country prepare immediately for producing warplanes at the rate of 50,000 a year—the message opening his promotion of greatly augmented armaments and calling on the people to "recast their thinking" about defenses and on Congress to appropriate \$996,000,000 therefor. On May 29 he reconstituted the Defense Commission as authorized in 1916. On May 31 he asked Congress for \$1,277,000,000 for defense. On June 3 he made his first request to Congress for authority to summon the National Guard to active service in emergency short of war. On June 7, endorsing the *New York Times's* editorial in favor of compulsory military training, he revealed himself to the press as an advocate of what later took shape in the Selective Service Act. On June 10, addressing the University of Virginia, he recited his recent fruitless efforts to dissuade Italy from joining the attack on France; cried, "The hand that held the dagger has struck it into the back of its neighbor"; and declared for material aid to the "opponents of force." On June 17 he asked Congress for another great appropriation with which to build warships. On July 10, in a special message to Congress he asked further appropriations of \$2,161,441,957 and yet more in authorizations toward armament and kindred purposes, approved a bill to draft men into service, and gave the reassurance, "We will not send our men to take part in European wars." Each of these utterances fitted with the rest like a link in a chain or a word in a sentence; so that their compact entirety had a massive effect, beyond the power of one in any other station to rival, since no one else had the habitual regular attention of so many of the people. Thus, when the Democratic National Convention opened in the middle week of July, the idea uppermost in the Nation's thoughts was defense; and defense had come to spell Roosevelt. Up to that moment the President had not by a single word hinted his attitude toward an offer of renomination. But on July 16, to a convention waiting to start nominations, the word was brought that the President, if selected, would accept. After that, any other nomination, even if the convention had wished another, would have been impossible to explain to a popular majority convinced of peril to the Nation and confident in but one man to face it.

The President's attitude to the Government's providing opponents of Germany and Italy with weapons of war developed by gradual steps. While he spoke out (June 10, as above) for extending the Nation's material resources "to the opponents of force," he could fairly be taken to signify letting Great Britain, in particular and chiefly, procure from American manufacturers such material as it could buy from them for cash under the existing law. The British Ambassador had shortly before declared in New York that his government intended to fight on alone if need be, and pointed out that American interest might justify Federal aid to the British. But American opinion was not ripe for the outright adoption of such a course. The

thing came about by successive moves. To begin with, the President accepted, without action of Congress, a British offer (made in August) to grant the United States a right to set up naval stations or bases in the British colonies—Antigua, Bahamas, Bermuda, British Guiana, Jamaica, Newfoundland, St. Lucia, Trinidad—and gave Great Britain in return some 50 old destroyers, still serviceable but removed from the active list. He also let producers sell to Britain warplanes designed for the U.S. Government.

Later on, President Roosevelt allowed priority to British orders, in growing number, over the U.S. Government's own orders, in deliveries from manufacturers of airplanes. As the year drew to a close it became apparent that the British had used up most of their investors' known supply of American securities and could not go on paying in the United States from their own pocket. The President now found himself compelled, as a condition of further supplying Great Britain, to convert opinion into favoring virtual subventions to that nation, from the Federal Government, in war material, to the loss of progress in the armament of the United States itself. His "fireside chat" of December 29 dealt mainly with this problem. It portrayed the country's risk in such term as to give keen alarm: "Never before since Jamestown and Plymouth Rock has our American civilization been in such danger as now." For proof it cited the Berlin agreement of September 27 for common action by Germany, Italy, and Japan, as a threat against the United States. "Democracy's fight against world-conquest" was declared to need the aid of "every ounce and every ton of munitions and supplies that we can possibly spare." Nothing was said as to how democracy would or could pay for these, except by using them "against world-conquest." The press and radio carried reports that Great Britain could not go on paying for munitions from America. The public was won for legislation to enable further shipment of munitions without full British payment. The same address conveyed a mild message to unions, that "the Nation expects" work for defense not to be hindered by strikes.

**President and Congress.** The President's main concern of the year, in carrying on his policies, was with the Nation. While he had the Nation with him, Congress, regardless of party and other pre-occupations, would follow his lead in the main matter of the foreign situation. There were other matters, however, in which Congress did not follow him. One was the members' purpose to stop the conceived vindictiveness of the NLRB toward employers. Another was the persistence of a moderate majority in passing the Logan-Walter bill to allow the courts to review the decisions of regulatory agencies. In the first case the adversaries of the NLRB failed to pass a bill to deprive that body of some of its functions, but the President gave way at length, without controversy, to objections to the reappointment of Chairman Madden. In the second case, he vetoed the bill for review of agencies' decisions, secure in the lack of a sufficient majority to override his veto.

The President was said by writers in the press to have expressed, not long before the start of the drive for full-speed armament, his willingness that Congress should adjourn. The Republican group made use of this, taking credit for superior foresight in keeping Congress sitting and thus having it in full working order when extraordinary grants were sought in a hurry.

**Efforts for a Partisan Moratorium.** The idea of prevailing on the two major parties to put aside strife lacked likelihood in a year of National elections. The President gave encouragement to the possibility, none the less, on a number of occasions. Before the Democrats' Jackson Day dinner, several leading Republicans in the Senate or the House received invitations (somewhat warmly declined) to come to this dinner. While the President did not issue the invitations, there seemed no probability that they could have gone out without his approval. In the middle of May the President sought an intimate talk at the White House with Alfred M. Landon, Republican Presidential candidate of 1936; but Landon countered with a statement opposing an adjournment of partisanship. In June the President himself suspended partisan considerations to the extent of nominating two Republicans for what had become the most exacting and ticklish jobs in the cabinet: for Secretary of War, Henry L. Stimson; for Secretary of the Navy, Frank Knox. Both gave fine examples of faithful service. On November 11, Wendell L. Willkie, in an address by radio shortly after his defeat as Republican candidate for President, declared for a Republican policy of "loyal opposition"; "We who stand ready to serve our country behind our Commander in Chief," he said, "nevertheless retain the right and, I will say, the duty to debate the course of our government."

**Personnel and Organization.** President, Franklin D. Roosevelt; Vice-President, John Nance Garner. The Cabinet: Secretary of State, Cordell Hull; Secretary of the Treasury, Henry Morgenthau, Jr.; Secretary of War, Harry H. Woodring (resigned June 20) and Henry L. Stimson; Attorney General, Robert H. Jackson; Postmaster General, James A. Farley (resigned as of August 31) and Frank C. Walker; Secretary of the Navy, Charles Edison (resigned June 4) and Frank Knox; Secretary of the Interior, Harold L. Ickes; Secretary of Agriculture, Henry Agard Wallace (resigned in August) and Claude R. Wickard; Secretary of Commerce, Harry L. Hopkins (resigned August 22) and Jesse H. Jones; Secretary of Labor, Frances Perkins.

The number of the civil employees of the Federal Government, as reported by the Civil Service Commission, rose from 987,538 at the close of 1939 to more than 1,058,596 at the close of September, 1940.

**Appointments and Resignations.** Five of the ten heads of Departments resigned and were replaced in the course of 1940 (see list of the cabinet, just above). A sixth shift, at the outset of the year, made Robert H. Jackson Attorney General in place of Frank Murphy who went to the Supreme Court. So extensive a change among the President's highest subordinates was unusual, but it did not appear to have any single controlling reason. Woodring quit the Department of War, reportedly because he opposed supplying European belligerents at the cost of greater progress in arming the United States itself. Farley left the Post Office because he did not like the President's third-term renomination. Edison left the Department of the Navy with well-based hope of becoming Governor of New Jersey. Wallace quit as Secretary of Agriculture to campaign as Vice-Presidential candidate. Hopkins's exit as Secretary of Commerce, whether for reasons of health or for some other intended task, left him seemingly as high as before in the President's confidence.

Among other changes in 1940 were the appoint-

ment, as Under-Secretary of the Interior, of Alvin J. Wirtz; the resignation of Fred H. Brown as Comptroller General and the appointment of L. Warren; the expiration of the term of Chairman J. Warren Madden of the NLRB, followed by a three months' vacancy, and eventually, the Senate remaining set against confirming Madden if he were renominated, by the appointment of a less-pronounced liberal, Harry A. Millis.

**Administrative Reorganizations.** Three more reorganizations affecting parts of the administrative government were carried out in 1940, under authority of the Reorganization Act of 1939 (see 1939 YEAR BOOK, p. 777). They were styled Reorganization Plans III, IV, and V. Their combined result, outside of revoking two minor changes previously made by executive order, was 3 consolidations, 4 abolitions, and 14 transfers. The only transfer of a considerable independent office to a subordinate place in a Department was that of the Civil Aeronautics Authority, made a part of the Department of Commerce, by provisions in plans III and IV. This change roused opposition in Congress, for commercial flying had suffered serious accidents when previously under departmental regulation early in the New Deal and had done well later under the CAA's care. The House passed (May 8) a resolution rejecting the change; but the act of 1939 gave the President's reorganizations the right of way unless rejected by both houses; the Senate now failing to reject, Plan IV became valid. Plan V moved the Bureau of Immigration to the Department of Justice, from the Department of Labor. Among several offices abolished under Plan III were those of Commissioner of Immigration and of Recorder of the General Land Office. A Commissioner of Immigration and Naturalization was created, subordinate to the Attorney General. The plans' dates of going into effect were June 30, for III and IV, and June 14, for V.

The President's creations and changes in matters of organization for regulating the pace and harmonizing the parts of work being done throughout the country for the production of armament ranked first in 1940, as to possible consequences, among his efforts as an organizer. This task did not come under the act of 1939, but it requires mention as an effort of administrative reorganization. The re-establishment of the Defense Commission and the development, out of it, of the more compact and powerful Office for Production Management for Defense are related in the articles DEFENSIVE PREPARATIONS and NATIONAL DEFENSE ADVISORY COMMISSION. Another regulative body for a field essential to security against foreign peril was the Defense Communications Board, created by executive order of September 24 and headed by the Chairman of the Federal Communications Commission (q.v.), to regulate the use of telegraph, telephone, cable, and radio in case of need. Dr. Clarence A. Dykstra was made National Director of Selective Military Service, a new statutory temporary office (see DRAFT, MILITARY).

See the separate articles on leading governmental bureaus and agencies. For a list of the independent offices and establishments, see YEAR BOOK, 1939, p. 782.

**Foreign Affairs.** The German war in Europe and to some extent the Japanese war in China affected the foreign relations in virtually every direction. A great part of foreign relations had to do with belligerents, another great part with governments of which the United States wanted the support for its own course.

**The Belligerents.** Official relations with Germany, so far as reported, were meager and featureless. In the case of Italy, the President directed a hurried and fruitless appeal through the Embassy at Rome, for a pause in the impending Italian attack on invaded France, in June.

In the case of Japan, the third of the powers bent on wholesale conquest, more occurred. The difference with Japan over the change of authority in the International Settlement at Shanghai remained unsettled, but the policing of the streets by a force in the Japanese interest was suffered as a temporary arrangement. The commercial treaty with Japan, abrogated by the United States on July 26, 1939, lapsed after 6 months' notice on Jan. 26, 1940. Trade continued, subject to change at any time. Successive restrictions cut off the airplane fuel, scrap metal, and machinery and tools that Japan particularly wanted Japan responded by going to Berlin and signing, September 27, an agreement in which Japan and the Italo-German alliance undertook to assist each other with military and other means in case of attack by "a power at present not involved in the European War or in the Chinese-Japanese conflict;" essentially, by either the United States or Russia; but a further article of the published text gave reassurance that nothing was meant against "the status which exists at present" as to Russia. The publication of this agreement was closely followed by expressions in Tokyo, from Premier Konohe and others, admonitory to the United States. The latter (October 9) discontinued subsidy on exports of wheat to the Far East and advised American citizens to leave that region. Japan withdrew (October 23) from the convention of 1911 against pelagic sealing.

Relations with Great Britain and France before their disasters of May and June, while good, were restrained by the risk of stirring antagonism in the United States, where sentiment against all alike of the participants in any European war had by no means died out; the British and, to some extent the French, increasingly obtained airplanes and other material from American firms, paying on delivery. The President declared it lawful (January 26) and without prejudice to status as citizens that Americans should fight in a foreign army, provided that they did not swear allegiance to a foreign government. In February an outcry against British search of American vessels and examination of mail from the United States—features of the blockade of Germany—moved the Department of State to a futile effort to have the practices modified. The Government protested, with 20 other American republics (March 16), against the British pursuit of the German freighter *Wakama* within the zone of sea from which the Declaration of Panama (1939) had sought to ban belligerent powers from naval operations.

**The Sunken Nations.** The German conquests that culminated in June overcame France, Belgium, Holland, Norway, Denmark, and Luxemburg. The last two made no serious resistance. Belgium, Holland, and Norway maintained their governments, in form, outside their territory; there was established a French government in the part of French territory that the invaders left unoccupied. The United States formed diplomatic relations with this new French government and withheld recognition of regimes that Germany set up in other lands. It halted free transactions in the values of these countries lodged in its jurisdiction, as a means to keep them from coming into the conquerors' possession. Iceland, treated as separate from Den-

mark, was exempted from the suspension of Danish transactions.

**Remaining Democratic Belligerents.** The members of the British Empire remained at war with Germany. Greece, too, soon became a party in the European war, when attacked by Italy, and the Chinese government still held out in the western uplands of China. The United States' new policy, gradually shaped after May, supplied the British increasingly with material for war, as the alternative to having to deal with a Europe under a single domination. It allowed British military entry into the Dutch West Indies, lest these come under German power. When an organization headed by ex-President Hoover sought to send food to the fallen nations of Europe, and Great Britain refused lest this should weaken the effect of the maritime blockade of Germany, the objection was allowed to stand, the Department of State avoiding a direct appeal to the British government. With regard to Greece, the President (December 7) in a message to King George, said, in part. "It is the settled policy of the United States Government to extend aid to those governments and peoples who defend themselves against aggression. . . . Steps are being taken to extend such aid to Greece." A small belligerent was thus encouraged to continue, in expectation of military supplies. To China a series of credits were granted through the Export-Import Bank: on March 7, \$20,000,000; on September 25, \$25,000,000, to be repaid with tungsten; on November 30, \$50,000,000, to be repaid in metals; and on the last date the Treasury was announced to be making ready a sum of \$50,000,000 from the Stabilization Fund, with which to support Chinese currency.

**In the New World.** Despite the strain under which Canada labored as a participant in the European war, efforts were renewed to induce the Dominion to agree to put in motion the common project of the two countries for the development of the St. Lawrence Waterway (with water-power adjuncts)—a scheme long cherished by the President. A plan was devised in October to satisfy the objections on the part of Ontario: this province was to divert into the St. Lawrence watershed waters from the Albany River and to receive in return the right to hydroelectric power from an equivalent in water at Niagara Falls.

In dealings with Latin-American governments the United States had to do with a number of countries suffering from plethora of products and—by reason of the European war—lack of buyers. Unable to augment its purchases of their goods without hurting its own nation's economy, the U.S. Government felt the need of keeping such countries on the side of the Monroe Doctrine and firm against the possibilities of German and Italian commercial penetration. Loans were made by the Export-Import Bank to some governments: \$60,000,000 to Argentina, \$7,500,000 to Uruguay, \$4,600,000 to Costa Rica. Ninety 6-inch cannon out of surplus from the previous European war were sold to Brazil. Uruguay was reported (November 9) to have agreed to let the United States establish naval and aeronautical bases on its coast. In the Antilles, Santo Domingo obtained a loan of \$5,000,000 from the Export-Import Bank. Late in the year, agreements for U.S. naval stations or bases in Brazil, Argentina, and Chile were reported to be assured.

Dealing with the New-World republics as a group, Secretary of State Hull held, with their representatives, at Havana in July, the second consultative meeting of American foreign ministers.

The meeting drew up a convention providing for the American republics' joint control, through a commission, of any New-World areas (by inference, European colonies) that might become deprived temporarily of their governing authority; the convention required ratification by the several republics to put it in force. The meeting adopted a resolution providing temporary steps to like effect if needful before the convention should become valid and recognizing the right of "any of the American republics" to act as might be needful in order to defend itself or the continent. An agreement with the fourteen American countries producing coffee set their quotas, for three years, of allowable sales to the United States: Brazil's share was about one-half of the total for the fourteen.

No definite outcome was reported of efforts to obtain from Mexico adequate compensation for expropriated petroleum wells. It was stated in the press in October that a Japanese company had obtained from Mexico a concession to drill for petroleum in an area near Vera Cruz.

For a fuller discussion of United States relations with other nations, see the article on each foreign country. See also **PAN AMERICANISM**.

**Aliens and Disturbers.** Precautions were taken against aliens and others whose social or political sympathies might make them agents of sedition. In addition to the registration of aliens by the millions, under a new act of Congress (see *Legislation*, below), a process that went on for months in the post offices, there was a raising of barriers to entry over the borders and a resort to strict proceedings against persons of dubious loyalty, when they were found chargeable with fraudulently obtaining passports. Earl Browder, later the Communist candidate for President, was convicted (January 22) of using a passport obtained by making a false statement and was sentenced to four years of Federal prison and a \$2000 fine; he stayed free during appeal of his case. An order was issued for the deportation of his wife, an alien, for illegal entry into the United States. The Immigration and Naturalization Service (q.v.) started on July 1 to require documents with visas for all persons entering from Canada. An active and much reinforced patrol covered the Mexican border to intercept entries there. In August Attorney General Jackson renewed the investigation of the alien labor leader Harry R. Bridges, who, if found to be a subversive alien, might be deported for that reason alone, under a new law.

**Government and Labor.** The NLRB (q.v.), though winning a conspicuously high proportion of its chief cases in the Supreme Court, figured much less as the promoter of the interests of the industrial labor unions after the expiration of Chairman Madden's term of appointment: the two remaining members of the Board, differing in views of the NLRB's fundamental policy, stood deadlocked on matters that came before them and issued no more innovative orders. The eventual appointment of another comparatively conservative member, Harry A. Millis, caused several members of the staff, noted for their anti-employer leanings, to resign. Henry Ford remained obdurate against unions' demands that his great automobile-making establishment consent to an election among its employees to choose affiliation with a labor organization. After the National election, John L. Lewis resigned from the presidency of the C.I.O.; he had vowed, in an exhortation to the members to vote against President Roosevelt, that he would quit if Roosevelt were re-elected. Reportedly through his

PRESIDENT ROOSEVELT AND MEMBERS OF THE NATIONAL DEFENSE COMMISSION

Grouped before the President's desk are, left to right William C. Knudsen, Ralph Budd, Edw. R. Stettinius, Jr., Secretary of War Harry Woodring, Attorney General Robert Jackson, Leon Henderson, Secretary of Navy Charles Edison, Harriet Elliot, and (with face turned) General George C. Marshall

influence another liberal, Philip Murray, was chosen to succeed him; and Murray displayed at the outset a tendency to ask new concessions to his organization at the moment when conservatives in Congress were crying for the suspension of labor disputes on account of the proclaimed need for utmost production to meet demands of National safety. But in the face of evident strong hostility, in many directions, toward any "labor war" hurtful to the defensive program, no union started any major strike comparable to those of 1937.

Under the terms of the Wage and Hour Act, Philip B. Fleming, Administrator of the Wage and Hour Division (q.v.), put into effect the 40-hour week (usually of 5 working days of 8 hours), which became obligatory on October 24 as to employment affected by the act. By the Supreme Court's ruling (April 29) such regulation applied even to work on Federal contracts. Though employers might still, under the 40-hour week, get more hours of employment to the week, they must pay  $1\frac{1}{2}$  times the regular pay for extra hours. The new arrangement delayed the generality of that part of industry which was trying to swell the output of goods demanded to raise the power of the army and navy; for at a moment when, as declared emphatically by the Administration, an unexampled peril urged the Nation to utmost effort, and when the manufacturers could not get enough machine tools for starting the desired production, the use of even the existing machine tools was cut down far below what the existing force of employees could get out of them unless the manufacturers paid heavily for additional working time. The Department of War met the demand on its own six arsenals by ordering their operation, from August 10, by three shifts every 24 hours for six days a week; privately owned establishments, still largely working on contracts for fixed amount, and also unable quickly to add competent people to their forces, did not readily follow this example. A group of Southern Governors failed in litigation to prevent new, higher minimum wages, regarded as a blow to Southern factories, from going into effect, under the Wage-and-Hour Act. A decision of the Supreme Court (May 27) gave the Wage and Hour Division, instead of the Interstate Commerce Commission, the regulation of about 200,000 employed in running trucks and busses. The rates of minimum pay of about a like number employed in making garments were raised (July 14) by the Administrator's order. The Division successfully maintained in the courts its asserted right to force employers to show it the accounts of their payrolls. An embargo was put in June on the exportation of machine tools; it was later (December 4) much expanded.

**Prosecutions.** The Department of Justice started, early in the year, to prosecute under the Anti-Trust law many trade unions, largely in the A.F.L., for alleged practices in restraint of trade; frequently groups of employers accused of a part in these practices were also defendants. Prominent prosecutions in this number are mentioned in articles on the several States. Counsel for the A.F.L. failed to forestall these prosecutions by pleading in the courts, as they did, that the Clayton Act fully exempted unions from the anti-trust law. These prosecutions figured less in the news in the latter part of the year. Anti-trust prosecutions of big corporations progressed. The Supreme Court held against the Ethyl Gasoline Corporation, which was ordered to cease making the maintenance of prices a feature of its permission to other parties to use

its patents. A Court of Appeals' decision against the American Medical Association's demurrer to its indictment for conspiracy brought nearer to trial the Government's charges that the Association had conspired in restraint of trade. The trial of a case, started in 1937, against the Aluminum Company of America, for conducting a monopoly, was finished in August, but the bulkiness of the case delayed decision. Anti-trust proceedings were started in July against eight chief manufacturers of tobacco. A suit to undo the elaborate corporate structures of 22 chief companies producing petroleum and its products ran into the objection from the National Defense Commission, in September, that such a course would so disturb the industry as to hurt the Nation's defensive efficiency; the suit was then reportedly shorn of a demand that the companies rid themselves of pipe lines and certain other means of transport. Conviction of 12 oil companies in the Madison case was sustained by the Supreme Court. Suits designed to aid the means of defense were brought against makers charged with fixing the price of cotton fabric used in airplanes and against American firms enjoying German patents (to free these patents from restrictions in the United States).

The Attorney General announced (March 17) that the Department of Justice had given up wire-tapping as means to get evidence.

**Regulation in Other Fields.** The *Bituminous Coal Division*, established in the Department of the Interior in 1939 to succeed the National Bituminous Coal Commission, fixed minimum prices at the outset of May for sales of soft coal by mines, according to districts. The Bituminous Coal Act, basis of the power of the Commission and of the Department of the Interior as its successor, passed muster with the Supreme Court (May 20) as constitutionally valid. The Court had killed the predecessor Guffey Act about 4 years before but had been largely made over with Presidential nominees.

The *Interstate Commerce Commission* (q.v.) reported (August 31) that it had in recent years set or proposed reductions of nearly 60 per cent in the debt, previously \$3,708,484,169, of 25 bankrupt railroads. The ICC reduced the freight rates on cotton in May. It reported (January 26) adversely to the President on a projected canal between Lake Erie and the Ohio River, as likely to weaken the railroads in the region. It made effective on March 25 a reduction of the basic fare for passengers on the Eastern railroads, to 2 cents a mile. The President assumed, by proclamation of June 27, power of control over the movement of ships, both American and foreign, in adjacent waters. The Priorities Board of the Defense Commission restricted commercial aviation, at the end of November, to the receipt of airplanes already toward completion and to parts urgently needed.

Alteration of the corporate structure of *holding companies* in the field of supplying electrical current was advanced early in the year, by the SEC. The Associated Gas and Electric Company, in this group, sought (January 10) reorganization under the bankruptcy law; its head, Howard C. Hopson, prosecuted thereafter for using the mail in fraudulent operations, was convicted (December 31) on evidence to the purport that he had wrongfully got nearly \$20,000,000 from companies in the Associated system. The RFC offered its credit (August 15) to the service of utility districts in the area of Seattle, to help them buy out the distributing properties of the Puget Sound Power and Light Company. The *Federal Power Commission* won (De-

ember 16) in the Supreme Court, the long-contested New River case, against the Appalachian Electric Power Company and 41 of the States; the Court affirmed the Commission's authority to give licenses, as it might decide, for enterprises to obtain hydroelectric power from rivers classed as waterways. (See **ELECTRIC LIGHT AND POWER.**)

A special Federal court of three judges decided against Secretary of Agriculture Wallace in the Kansas City Stockyard case: it restored earlier marketing rates that the Secretary had ordered changed in 1937 and awarded to the marketing people the impounded money resulting from the difference between the two sets of rates. A new head of the *Farm Credit Administration* (q.v.), A. G. Black, after taking office, pronounced (February 24) for a policy of leniency toward worthy delinquent agricultural debtors, designed to keep them on their farms. There followed, none the less, considerable display of dissatisfaction with the governmental reorganization of 1939 that had reduced the FCA from an independent office to a part of the Department of Agriculture; and the master of the National Grange asked Congress to restore the FCA to independence. The Department of Commerce gave much attention to obtaining and disseminating data on the barriers set up by the laws of individual States to the disadvantage of goods from other States. The Federal Communications Commission (q.v.) revoked (May 27) a previously-given order to permit broadcasts of television to start in September.

#### LEGISLATION

**76th Congress, Third Session.** (For names of members see SENATE, and REPRESENTATIVES, HOUSE OF.) The third (or regular second) session of the 76th Congress convened on January 3. It adjourned formally only on Jan. 3, 1941, the date of the convening of the 77th Congress. The session thus lasted for 367 calendar days, exceeding the duration of any previous session. Some members' aversion to disbanding the Legislative branch of the Government at a moment of grave uncertainties, rather than pressure of business, kept the session going; brief, successive recesses spaced out much of its last months. Prior to the end of October, however, it passed many measures of moment.

**Main Features of the Session.** From June onward, a prevailing sense of need to put the United States in such a state of warlike preparedness as to assure it against risk of numerous European nations' fate, which they were then suffering, governed the great majority of the members, whichever their party. Few openly tried to cast doubt on the peril or to bound measures against it within the order of any precedent short of an actual and dubious war. There resulted appropriations that dwarfed the deficit years of the New Deal; grants of Executive power comparable to these grants of money; a great increase in the Federal levies on the net return of profitable industry; a far more unprecedented demand upon the yet unestablished lives of the young men, in the form of peacetime conscription; and a flock of measures for the restraint of anti-Governmental activities that had in days of self-confidence been ignored or tolerated. Measures within the ordinary scope of Congress, though less noted at the time, covered much ground (see, below, *Transportation Act, Investment Company Act, Political Activity Act of 1940, Bridge Act, etc.*) and some were hailed as beneficent.

**Enactments.** There follows a brief summary

of conspicuous points in important measures enacted by Congress.

#### Taxation and National Debt:

**Revenue Act of 1940.** signed June 25, created an intended additional \$1,000,000,000 of internal revenue yearly, for five years, chiefly by lower exemptions and higher rates of tax and surtax on incomes and by defenses taxes adding generally 10 per cent to income taxes and most other internal revenue; also, authorized the Treasury to issue \$4,000,000,000 of short-term obligations above the previous debt-limit of 45 billions.

**Second Revenue Act of 1940 (Excess-Profits Tax Act),** signed October 8, further taxed a part of corporate income by levying up to 50 per cent on profits exceeding either 8 per cent of invested capital or 95 per cent of average yearly earnings of 1936-39, as the payer chose; also raised the normal corporate income tax for all but small companies to 24 per cent; and exempted from taxation, in the case of companies expanding to work for National defense, enough earnings to amortize cost of expansion in five years.

#### Chief Appropriations:

**Military Establishment Supply Act,** signed June 13, appropriated \$1,449,323,322 for the Army's expenditure in the fiscal year 1941, including \$79,505,988 for airplanes and their equipment, and authorized up to \$103,300,000 of further airplane contracts.

**Naval Appropriation Act,** signed June 11, appropriated \$1,308,171,138 for the Navy's expenses of the next fiscal year, including \$340,371,979 for building naval vessels and commencing, among others, two battleships.

**First Supplemental National Defense Appropriation Act,** signed October 9, appropriated \$1,497,777,147 for additional expenditure in many directions by army and navy, for defensive preparations. See also **DEFENSIVE PREPARATIONS.**

**Second Supplemental National Defense Appropriation Act,** signed September 9, appropriated \$1,793,372,532 for army requirements, including over \$500,000,000 each for Air Corps and Chemical Warfare Service, \$703,643,860 for the navy, largely for more airplanes and ships, and \$100,000,000 for the President to allocate for housing needed near army posts, navy yards, and factories; also authorized army and navy contracts for \$2,754,470,000.

**Third Supplemental Defense Appropriation Act,** signed October 8, appropriated \$1,248,792,636 for the army and \$75,401,000 for the navy, much of the army's total covering costs connected with the active service of the National Guard and the maintenance of the Selective-Service conscripts.

**Army Housing Act,** signed September 24, appropriated \$329,519,902 for constructing buildings and flying fields at army posts.

**Independent Offices Supply Act,** signed April 18, appropriated \$1,120,243,528 for the expenses, in the fiscal year 1941, of the Civil Aeronautics Authority (\$27,721,954), Civil Service Commission (\$97,241,000), Public Roads Administration (\$140,990,000, mainly road-aid to States), Veterans' Administration (\$580,003,544), TVA (\$40,000,000), and other offices.

**State, Commerce, and Justice Supply Act,** signed May 14, appropriated \$107,149,000 for the departments named.

**Interior Department Supply Act,** signed June 18, appropriated \$135,382,330 for that Department.

**Treasury and Post Office Supply Act,** signed March 25, appropriated \$1,032,801,095, of this, \$218,752,033 for the Treasury and \$814,049,062 for the Post Office Department (recoverable from its receipts, mostly, or all).

**Agricultural Appropriation Act,** signed June 25, \$212,000,000 for parity payments on wheat, cotton, corn, rice, and tobacco; \$438,560,000 for soil-conservation payments, plus \$60,000,000 of unobligated balances from 1940; \$3,075,000 for Rural Electrification Administration, with authority for it to borrow \$100,000,000 from the RFC; \$6,100,000 to aid tenant farmers and authority to borrow \$50,000,000 from the RFC therefor; total appropriation, \$918,603,918.

**War Department Civil Functions Act,** signed June 24, granted \$222,718,717, chiefly for work on rivers and harbors, control of floods, and the Panama Canal.

**First Supplemental Civil Functions Appropriation Act,** signed October 9, added \$228,132,013 to divers appropriations for the fiscal year 1941.

**Four deficiency appropriation acts:** \$487,809,261 for fiscal year 1940.

#### Fighting-Power:

**Naval Expansion Act,** signed June 14, added 167,000 tons, mainly in aircraft-carriers and cruisers, to the authorized tonnage of naval vessels, empowered the President to construct the additional ships, and set the intended minimum of useful naval airplanes at 4500. See **NAVAL PROGRAMS.**

**Naval Aircraft and Public Works Act,** signed June 15, authorized increase of naval airplanes to a maximum of 10,000 and the construction of \$144,132,000 of additional facilities for naval aviation.

**Naval Building Acceleration Act,** signed June 28, gave

the Secretary of the Navy and the President powers to promote quicker results in naval construction, by cash advances on contracts, by prior receipt of needed material, and by suspension of requirements of the Walsh-Healey Act, but limited the allowable profit, on contracts that allowed a percentage of cost, to 8 per cent.

**Defense Expediting Act**, signed July 2, similar to the Naval Building Acceleration Act, gave special powers to the Secretary of War to hasten production necessary to the land forces, and removed the limit to the number of the Army Air Corps's flying cadets.

**Two-Ocean Navy Act**, signed July 19, designed to provide secure naval defense in the Pacific and Atlantic oceans simultaneously, authorized an additional 1,325,000 tons of naval vessels, the total tonnage including 385,000 in capital ships, 200,000 in aircraft carriers, 420,000 in cruisers, and 70,000 in destroyers, and appropriated \$150,000,000 to help equip establishments to build the ships and \$65,000,000 and \$35,000,000 respectively for like aid to makers of ordnance and of armor. See **NAVAL PROGRESS**.

**National Guard Act**, signed August 27, empowered the President to put the National Guard into active service for 12 consecutive months prior to June 30, 1942.

**Selective Training and Service Act of 1940**, signed September 16, set up a system of compulsory service in the armed forces—in effect, the army only—for selected men of the group from 21 to 35 years old, and gave the President power to seize establishments that did not comply with Federal orders to produce war-goods. See **DRAFT, MILITARY**.

#### Federal Lending Agencies:

**RFC Act of 1940**, signed June 25, authorized the Reconstruction Finance Corporation to lend to, or buy stock in, any corporation producing, acquiring, or carrying strategic materials or needing to obtain facilities for producing war goods, subject to the President's approval.

**Commodity Credit Act of 1940**, signed August 9, raised the lending limit of the Commodity Credit Corporation to \$1,400,000,000 from \$900,000,000.

**Export-Import Bank Act**, signed September 26, authorized this Federal agency, on request of the Federal Loan Administrator, approved by the President, to lend to any government or its central bank, or with the guarantee of these two, to any agency or national of such a government, in the Western Hemisphere, and enabled the Bank to get up to \$500,000,000, for such loans, from the RFC.

#### Aid to European Lands:

**Finland Loan Act**, signed March 2, added to the Export-Import Bank's authority to lend to foreign governments and limited such loans to Governments not in default as to war debts (the object being a loan to Finland).

**Finland War-Debt Act**, signed June 15, granted Finland a postponement of payment on war debt till the end of 1940 and authorized the Secretary of the Treasury to agree that Finland make the postponed payment by installments over 10 years, with interest at 3 per cent.

**Red Cross Ship Act**, signed June 26, amended the Neutrality Act of 1939 so as to let American vessels convey Red Cross workers, medical supplies, food, and clothing to ports of belligerents.

**Mercy Ship Act**, signed August 27, amended the Neutrality Act of 1939 so as to let American ships bring refugee children away from areas of war.

#### Control of Aliens, Foreign Agents, Spies, etc.:

**Espionage Act**, signed March 28, raised the penalties for violation of the act of 1917 as to espionage and related acts in peacetime to 10 years and \$10,000 maximum for espionage, put the utmost penalty for sabotage at 20 years and \$10,000, and provided punishment up to 10 years and \$500 for injurious propaganda.

**Foreign Credits Act**, signed May 7, extended the President's powers over transactions in foreign values, to include rule over the handling of or dealing in evidences of debt or ownership involving any foreign State, subdivision, or national.

**Alien Registration Act**, signed June 28, obliged aliens to be registered and fingerprinted by the Bureau of Immigration and prohibited all persons' advocacy of insubordination, disloyalty, mutiny, or refusal of armed service.

**Anti-Propaganda Act**, signed October 17, required the registration of organizations engaged in political or civilian-military activity or advocating the overthrow of the Government.

**Repatriation Act**, signed July 2, restored citizenship to native-born women who, though married to aliens, had resided continuously in the United States since marriage.

#### Regulating Commerce:

**Transportation Act**, signed September 18, declaring a policy of impartial regulation of all modes of transportation subject to the Interstate Commerce Act, detailed and modified the Interstate Commerce Commission's powers at many points, required carriers by water to make through routes and rates with other carriers, subjected coastal, intercoastal, and internal carriers by water to the Commission's regulation in many respects, created a board to investigate the relative economy, fitness, tax burdens, and benefit from public expenditure on their right-of-way, of carriers by rail, water, and highway, raised the limit of the RFC's loans to

railroads, and abolished discriminative rates on freight. See also **INTERSTATE COMMERCE COMMISSION**.

**Investment Company Act of 1940**, signed August 22, required the registration and regulation of investment companies and of investment advisers, mainly by the hand of the SEC. See also **FINANCIAL REVIEW**, under **Financial Regulation**.

**Bridge Act**, enacted over the President's veto June 21, required the alteration of any bridge obstructing navigation and adopted the policy in the case of railroad bridges that the Government should bear such part of the cost as did not profit a bridge's owner.

**Convict-Made Goods Act**, signed October 14, made it a penal offence to transport in interstate commerce any goods produced by convict labor.

#### Affecting Politics and Government:

**Political Activity Act of 1940**, signed July 19, brought under the restrictions of the Political Activity Act (Hatch Act) of 1939 such employees of States as were connected with functions supported wholly or partly by Federal money and put a limit of \$3,000,000 on the yearly expenditure and receipt of contributions by any political committee.

**Civil Service Act of 1940**, signed November 26, permitted the President to admit into the classified civil service Federal employees not already included, with some exceptions, mainly the forces of the WPA and the TVA.

**Reapportionment Act of 1940**, signed April 25, postponed until the week of the meeting of the 77th Congress (in January, 1941) the President's submission of the required apportionment of the Representatives on the basis of the 16th Census, advancement in the dates for convening sessions having made the time for this duty of the President, as set in the old Reapportionment Act, come in advance of the census.

**Governmental Reorganization Act of 1940**, signed June 4, gave approval to the Executive reorganizations III, IV, and V, and set dates for their going into effect.

#### Public Support for the Poor:

**Emergency Relief Act of 1940**, signed June 27, appropriated \$1,157,711,357 for expenditure in the fiscal year 1941 on divers sorts of public support for individuals, of which \$975,000,000 was for the WPA and \$50,000,000 for the President to use in aiding refugees; also, excluded Communists and persons connected with the Nazis from the WPA's payroll.

**Total of Appropriations.** In common phrase the session "spent" or "voted" over 27 billions. That total included possible expenditure of several sorts: appropriations for the fiscal year 1941; some deficiency appropriations for the fiscal year 1940; "permanent" appropriations payable from receipts of trust funds; authorization of contracts committing the Government to pay money that would have to be appropriated later; and authorization of a plan to build the navy up, over a course of years, to effectual strength on two oceans at once (contracts therefor not generally being yet authorized as to amounts). Appropriations proper came to \$16,920,627,477 (of this, \$16,257,787,781 for fiscal year 1941); permanent appropriations, to \$2,148,921,298; authorizations for obligation by contract, to \$4,066,191,860; and the expected cost of building to attain a two-ocean navy, to \$4,586,000,000. For the Army, the share of appropriations (\$5,612,665,170 for 1941) and authorizations of contracts totaled \$8,792,145,145 (as reported in the *New York Times*); for the Navy, appropriations (\$2,512,448,407 for 1941) and authorizations totaled \$3,537,138,137; for civil costs connected with defense or with enforcement of law as to neutrality, \$766,944,648. The total likely to be spent in the fiscal year 1941 remained unpredictable: there lacked any way of telling how fast the work of armament would progress. The amount of all expenditure contemplated by acts of the session reportedly exceeded every previous total of the sort except that for the second session of the 65th Congress in 1918.

**Bills that Failed.** Bills killed by veto included mandatory deportation of aliens guilty of sabotage or espionage, having a criminal record, or violating the law on narcotics; permission to States to intervene in a suit raising an issue between Federal and State powers; extension of crop insurance to cotton; reimbursement of Ohio for social-security

money withheld in October, 1938; and appropriation of about \$110,000,000 for improvement of rivers and harbors. The Logan-Walter bill, to submit administrative agencies' rulings to courts' review, was passed after a long struggle; it was vetoed, December 18.

The House killed, by adverse amendments a bill strongly supported in the South, to extend exemptions from the minimum wages. A measure to terminate the President's authority to buy silver abroad passed the Senate but did not come through the House. Amendments to the National Labor Relations Act, tending to mend its conceived antagonism to employers, passed the House, with the aid of the A.F.L., but did not reach the statute books. The House sent to the Senate, as it had before, an anti-lynching bill, which the Southern strength in the Senate and a virtual cessation of lynchings of Negroes kept from going farther. A bill for the summary deportation of Harry B. Bridges, potentate over unionized maritime workers on the Pacific Coast, died after leaving the House. The House voted a resolution to invalidate Executive Reorganization IV, condemned because it put civil aeronautics back under departmental control; the Senate's rejection of a similar resolution let the change go into force.

**Organization of the Houses.** William B. Bankhead, speaker of the House, died on September 15. The members chose Sam Rayburn of Texas to succeed to the speakership and named John W. McCormack of Massachusetts to be floor leader in Rayburn's place.

The absence of Vice-President Garner in the latter part of the year left to substitutes the duties of the President of the Senate. The death of Senator Key Pittman of Nevada (November 10) deprived the committee on foreign affairs of an experienced chairman. William E. Borah of Idaho, who died on January 19, was not only the Senator of longest service but the foremost of the Senators in National renown.

**Investigations.** For the work of the House of Representatives' special committee investigating un-American activities, which by the nature of its task touched closely on some of the Nation's gravest current concerns and did much to shape opinion on disruptive groups; see **DIES COMMITTEE**. The House's committee investigating the NLRB, which had begun its work the year before, disclosed many purported singularities in the proceedings of that body: for instance, removal of its trial examiner from conduct of a case on the C.I.O. complaint that he had made rulings in the employer's favor, instructions from Board Chairman Madden to regional directors on how best to influence members of Congress, and consultation with Harry B. Bridges, C.I.O. leader, on what lawyer should be sent out to deal with a labor case. It appeared from testimony that the Board had in one case obtained information, outside of the proceedings of record, that helped it to decide in favor of employees, but that in another case it had refused to reopen proceedings for further information that an employer sought to put on the record. Chairman Madden testified on a so-called blacklist of employers, given to the RFC by the NLRB, which was likely to decide in some instances whether firms on the list should obtain loans. The committee, acting by a majority of 3 to 2, submitted to the House (March 7) a bill designed to abolish the NLRB and put in its place a board without prosecuting powers. The House's committee on appropriations, authorized in March, 1939, to investigate the WPA,

made an extensive report on the subject (May 15, 1940): dealing with operations in only a minority of the States, this report contained charges of undue favoring of individuals of liberal affiliations (as in New York City), want of thorough planning of expensive projects (notably New York City's North Beach airport), heedless extravagance (a rat-extermination project in New Orleans allegedly cost \$2.87 for each exterminated rat), and more or less illicit profiting; many of the accusations lacked novelty, so the report made no great sensation, but it gave strength to scattered criticism by uniting it, and it helped put through the anti-Communist provision included with the year's appropriation for the WPA. A special committee of the House, to investigate the migrant population, was authorized (April 22); its proponents had former farmers set adrift by drought—the "human erosion of the dust bowl"—particularly in view.

The Senate's committee investigating campaign expenditures performed much work during the National campaign of 1940, but its inquiries did not lead to the disqualification of any important candidate up to the end of the year. The committee's chairman, Gillette of Iowa, charged "debauchery of the ballot" in a public speech (December 2). The postponement in 1932 of an anti-trust case against the Radio Corporation of America was investigated by the Senate's committee on interstate commerce, and allegations adverse to a number of persons were brought out. The Senate's subcommittee investigating civil liberties (La Follette committee) obtained at San Francisco in January testimony on the close co-operation, in some of California's agricultural counties, of county officers with local organizations of the Associated Farmers to prevent strikes among the agricultural hired workers; in May the committee gave out data to show that the migratory agricultural hired workers in Texas got too little and too precarious pay for proper living. A Senate subcommittee brought out in November evidence of a covert business in wire-tapping for hire.

The Temporary National Economic Committee (a select committee of Senators, Representatives, and individuals from the administrative branch of the Government) made some further progress in 1940, along its immense potential orbit through the Nation's economic field. Among subjects investigated were the practices of life-insurance companies with regard to making profitable types of underwriting pay the losses of the unprofitable; States' laws indirectly excluding or hampering the introduction of goods from other States; and the disputed connection between increased use of labor-saving machinery and increased unemployment.

**UNIVERSALISTS.** A religious denomination which holds as part of its doctrine the universal fatherhood of God and brotherhood of man. Headquarters, 16 Beacon St., Boston, Mass. See **RELIGIOUS ORGANIZATIONS**.

**UNIVERSITIES AND COLLEGES.** According to the *Educational Directory* published by the U.S. Office of Education, there were 1699 in-

stitutions devoted to higher education in the United States in 1940. The distribution of these institutions by type, student body, and control is shown in the accompanying table:

See ARCHITECTURE; EDUCATION and the section on Education under the various countries; EDUCATION, U.S. OFFICE OF. For donations and grants, see BENEFACTIONS; CARNEGIE ENDOWMENTS;

# INSTITUTIONS OF HIGHER EDUCATION IN THE UNITED STATES

\* Includes 3 under Public control.

The Office of Education estimated the enrollment in all institutions of higher education at 1,425,000 (including 100,000 graduate students) for the school year 1940-41; of this number, approximately 400,000 were entering as college freshmen. The instructional staff, not including officers, etc., totaled 110,000. According to a survey by Dr. Raymond Walters of 652 approved universities and colleges, full-time enrollment for 1940 increased 2.7 per cent over 1939 to a total of 883,594. Part-time and summer school students brought the grand total to 1,347,146. The number of freshmen entering the engineering field (32,321) increased 5 per cent, while the Liberal Arts courses lost 1.5 per cent, teachers' colleges 7.4 per cent, and agriculture 8.4 per cent. New York University had the largest total, 35,623 although the University of California had the largest full-time student body, 25,989.

On pages 766-787, there appear in tabular form a list of and statistics for the accredited universities and colleges of the United States. This information has been compiled from the 1940 edition of *American Universities and Colleges*, edited by Clarence Stephen Marsh and published by the American Council on Education, Washington, D.C. Except as amended in footnotes, the information pertains to the academic year 1938-39. The following statement explains the compilation of the list:

"The American Council on Education does not accredit or approve educational institutions. It accepts the lists of institutions approved by the regional accrediting associations.

Each institution whose exhibit is contained in this book has been approved by one of these associations or in the case of one state by the state department of education. Associations whose accredited lists have been used are the Middle States Association of Colleges and Secondary Schools, the North Central Association of Colleges and Secondary Schools, the Northwest Association of Secondary and Higher Schools, the Southern Association of Colleges and Secondary Schools, the Association of American Universities, and the American Association of Teachers Colleges; college members of the New England Association of Colleges and Secondary Schools have also been included."

GENERAL EDUCATION BOARD; ROCKEFELLER FOUNDATION.

UTERMAYER COLLECTION. See ART under Art Sales.

URANIUM. See PHYSICS.

URUGUAY. A South American republic. Capital, Montevideo.

**Area and Population.** Area, 72,153 square miles; estimated population on Dec. 31, 1938, 2,122,628. During 1939, 1240 immigrants entered the country and 1441 left. The people are almost entirely of European descent, with Spanish, Italian, and Portuguese strains predominating. The language is Spanish. Estimated population of Montevideo, 703,518 (December, 1938); of other cities in 1936: Paysandú, 50,000, Salto, 48,000; Mercedes, 34,000; Minas, 30,000. United States citizens resident in Uruguay Jan. 1, 1940, numbered 210.

**Defense.** As of Nov. 1, 1939, there was a standing army of 7916 men, an air force of 318 with about 50 planes, and 24,000 trained reserves. The National Guard, or militia, in which service is compulsory in wartime, had a nominal strength of 100,000. The Navy consisted of 1 torpedo gunboat, a survey ship, 3 patrol vessels, and a few minor craft. Defense appropriations for 1940 were 11,721,000 pesos (11.9 per cent of the budget).

**Education and Religion.** Nearly 35 per cent of all adults are illiterate. Education appropriations for 1940 were 4.1 per cent of the total budget. A considerable number of new school buildings were completed during 1939. Educational statistics (1937): Elementary, 1624 schools, 203,616 pupils; secondary, 13,458 pupils; evening, 9918 pupils; normal, 1266 students; university, 17,122 students. The majority of the people profess the Roman Catholic faith but there is complete religious freedom and no State church.

**Production.** Processing and manufacturing industries account for about 59 per cent of the total national production, pastoral industries for 24 per cent, and agriculture for about 12 per cent. The 1937 livestock census showed 8,296,890 cattle, 17,-

\* In some instances degree-granting privileges were gained many years after the date of founding, which accounts for the relatively small total.

† Corrected.

\* Three hundred and fifty members of the Harvard faculty gave part-time instruction. Ninety-five of the Harvard faculty gave instruction under the tutorial system.

\* Total degrees, endowment, and gifts or appropriations since foundation include the New Jersey College for Women.

\* Figures were supplied by the university for faculty, total students, men, women, and summer school students.

† Served by faculty and library of Hobart College.

\* No information supplied by institution.

931,327 sheep, 600,000 horses and 308,000 swine. In 1939, 961,096 cattle, 1,501,752 sheep, and 106,419 swine were slaughtered at the frigoríficos (packing plants). The 1939-40 wool clip was nearly 132,000 bales; exports, 104,933 bales. Production of the chief crops in 1939-40 was (in metric tons): Wheat, 260,400; barley, 16,800; oats, 44,600; corn, 158,700 (1938-39); rice, 22,164; potatoes, 38,500 (1938-39). The 1936 industrial census showed 11,470 factories employing 90,128 workers.

**Foreign Trade.** Merchandise imports in 1939 were valued at 84,090,240 pesos (95,600,000 in 1938) and exports at 101,366,300 pesos (96,355,000 in 1938). In order of value, the chief 1939 exports were unwashed wool, washed wool, linseed, frozen beef, preserved meats, salted cowhides, and wheat. Great Britain took 18.5 per cent of the 1939 exports (26.2 in 1938); United States, 13.9 (4.0); Germany, 12.1 (23.5). Of the 1939 imports, Great Britain supplied 18.3 per cent (19.8 in 1938); Germany, 16.4 (16.8); United States, 5.3 (12.1).

**Finance.** Budget estimates for the calendar year 1940 were the same as for 1939 (receipts, 92,600,000 pesos; expenditures, 91,200,000). The national debt increased 13.7 per cent from 350,170,089 pesos on Dec. 31, 1938, to 398,084,266 pesos on Dec. 31, 1939. On the latter date the internal debt was 245,909,699 pesos; external, 147,309,067; international, 4,865,500. Average free exchange rate of the peso was \$0.3626 in 1939 (\$0.4173 in 1938); controlled free rate, \$0.4995 in 1939 (\$0.5697 in 1938).

**Transportation.** In 1940 there were about 1520 miles of railway lines, including a 33-mile section of the state railways completed Dec. 4, 1939, some 22,750 miles of highways (about 260 miles completed in 1939); and air connections at Montevideo with all parts of the Americas. The European air mail services were in most cases interrupted by the European War. During 1939, 806 commercial aircraft landed at 9943 airports and 1026 ocean-going ships and 943 river steamers entered the ports.

**Government.** The Constitution of May 18, 1934, vested executive power in a President aided by a Council of Ministers, and legislative power in a Senate of 30 and a Chamber of Deputies of 99 members, elected by popular male and female suffrage for four years. The Senate seats are divided equally between the two political parties receiving the highest number of votes in a presidential election. The legislators proclaim as President for four years the candidate chosen by the voters from the political party polling the highest vote. His cabinet of nine members is selected from the two strongest parties. President in 1940, Gen. Alfredo Baldomir (Colorado party), who assumed office June 19, 1938. His cabinet contained six Colorados and three Blancos. The composition of the Chamber elected Mar. 27, 1938, was: Colorados, 64; Blancos, 29; Socialists, 3; Catholics, 2; Communists, 1. In the Senate there were 15 Colorados and 15 Blancos.

### HISTORY

**The German Plot.** An unsuccessful conspiracy by the Uruguayan branch of the German National Socialist party to convert Uruguay into an agricultural colony of the Third Reich produced profound repercussions within that republic and throughout the Western Hemisphere in 1940. The Nazi organizations in every American republic had been frequently accused of subversive activities and in some countries documentary and other supporting evidence had been obtained by public au-

thorities (see articles on ARGENTINA, BRAZIL, CHILE, COLOMBIA, etc., in YEAR BOOKS for 1937 to 1940 inclusive). But the Uruguayan conspiracy was the first instance in which a branch of the German Nazi movement in the New World was shown, by evidence submitted in a court of law, to have prepared to seize power directly, without operating behind the customary screen provided by native revolutionary elements.

The preliminary evidence leading to the unveiling of the conspiracy was presented to the Ministry of Defense early in May by Prof. Hugo Fernández Artucio, who had conducted a private investigation of German activities in Uruguay. This evidence was produced before the Chamber of Deputies with the result that on May 15 it appointed a committee to conduct a formal inquiry. The inquiry proceeded while German armies crushed the Netherlands, Belgium, Luxemburg, and France. Alarmed by the evidence turned up by the investigating committee, the Uruguayan Government on May 28 urgently requested Congressional approval of universal conscription and general rearmament. It asked for funds to purchase two 1500-ton destroyers, naval and military airplanes, heavy-caliber coast defense artillery, and complete new equipment for the army and navy.

At the same time President Baldomir asked Congress to amend the Constitution so as to outlaw associations spreading propaganda against the democratic republican form of government and all political organizations with foreign connections. Other amendments banned use in Uruguay of uniforms, salutes, and insignia of foreign political parties, placed all foreign language schools under government control, curbed the importation of printed political propaganda, and in other ways empowered Uruguayan authorities to control Nazi agents and their activities. Meanwhile the government sought to discourage anti-Nazi demonstrations in various parts of the country and to avoid an open break with the Reich at a time when a complete German victory in Europe seemed imminent.

The rearmament bill and constitutional amendments were both adopted by Congress with little discussion due to the increasing gravity of the crisis. Acting on information furnished by the Brazilian Government, the police on May 29 discovered in the home of Arnulf Fuhrmann, a Nazi leader, at Salto on the Uruguay River a document describing a plan for the overthrow of the republic with the aid of German war veterans from Argentina. It called for the "immediate elimination of all Jews, Masons, and political leaders." Other documents indicated a plan to use Uruguay as a base for extending German domination over all South America.

**Foreign Aid Asked.** The Uruguayan Government immediately sent secret calls for aid to Argentina, Brazil, and the United States. Argentina rushed a flotilla of gunboats up the Uruguay and Paraná rivers to patrol the river frontiers of Uruguay and Paraguay. Brazil shipped Uruguay 5000 rifles and 5,000,000 rifle cartridges to arm the numerous Uruguayan volunteers enlisting in the militia as a result of an urgent government appeal. President Vargas also concentrated Brazilian troops along the Uruguayan frontier and offered military aid in crushing the threatened uprising. The United States hurriedly dispatched two cruisers to Montevideo and sent a military and a naval officer by air to consult with Uruguayan officials.

Meanwhile on June 6 the Uruguayan Minister

of Defense mobilized all military and police forces and placed guards at key communication and transportation centers, especially along the frontiers. Licenses of all amateur radio stations were cancelled. German Nazi and Italian Fascist leaders were placed under surveillance along with some Uruguayan anti-government politicians suspected of conspiring with the Nazis. Legal steps were also planned to dissolve the German Nazi organizations and prosecute their leaders.

At this point the German Minister in Montevideo informed Uruguayan authorities (June 12) that the Nazi party and German Labor Front organizations had been dissolved and their properties turned over to the German Legation. He declared German organizations in Uruguay had been under his personal supervision since the outbreak of the European War and had complied strictly with all Uruguayan laws. Nevertheless the Uruguayan Government on June 17 announced the arrest of 12 leading Nazi agents.

**Report on Inquiry.** The same day the Chamber of Deputies in secret session heard the report of its special committee investigating Nazi activities. This report sustained Professor Artucio's original charges. It stated that Nazi plans for the domination of all South America were being developed through a secret lodge within the Nazi party operating from Montevideo. The 12 Germans under arrest were said to constitute the secret order's supreme council for Uruguay. The report set forth in detail the organization, methods, and objectives of the Nazi movement in Uruguay and other American republics.

Publication of this sensational report was suppressed by the Uruguayan Government following representations from the German Minister, who was said to have threatened a diplomatic break if any of the Nazi leaders were convicted or deported. The morale of the Uruguayan people was bolstered by the arrival of the American cruiser *Quincy* in Montevideo June 20. But in Congress the section of the Blanco party led by Sen. Luis Alberto de Herrera strongly opposed any action that would offend the Reich. The Baldomir Government feared that a victorious Germany would retaliate and apparently was not satisfied that it could depend upon Argentina, Brazil, and the United States for the necessary economic and military support. Consequently the Nazi prisoners were released on June 27.

**Germans Rearrested.** Subsequently Britain's resistance to the German *blitzkrieg* and the pledge of assistance in dealing with subversive activities given by the other American republics at the Havana Conference lessened Uruguay's fear of German reprisals. At the same time wide public indignation was aroused by boasts of the freed Nazi leaders that they would "get" Professor Artucio and by the filing of criminal libel charges against him by a pro-Nazi editor. This suit, which was dismissed by a Montevideo court on November 22, provoked sharp denunciation of the government and the courts in the Chamber of Deputies for failing to bring the accused Germans to trial. With only two Deputies dissenting, the Chamber voted to send the record of this debate to the Supreme Court and Minister of Interior. Immediately afterward (September 20) the government filed a 29-point indictment against the Nazi leaders and the eight remaining in the country were re-arrested and brought to trial.

Those arrested included Arnulf Fuhrmann, confessed author of the plot; Julio Holzer, leader of

the Storm Troop units in Uruguay; Rudolf Meissner, agent in Uruguay and adjacent territories of the German secret police; Otto Klein, chief of the Nazi commercial propaganda organization; Rudolf Paetz, organizer of Nazi cells in Uruguay; Adolf Dutine, leader of the Nazi *stutzpunkt* (support point) at Paysandú; Reginald Becker, organizer of propaganda in Uruguayan schools; and Fred Sconfeld Gordon, alleged international spy and Gestapo liaison agent. The Fuehrer of the Nazi party in Uruguay was Julius Dalldorf, who as press attaché of the German Legation in Montevideo was immune from arrest.

**The Trial.** The indictment charged the defendants with being leaders of an unassimilable, ultranationalist racial and political party controlled from Germany and engaged in spreading its ideas among German residents of Uruguay, forcing them to choose between Uruguayan citizenship and membership in the German National Socialist party. It alleged that teachers of German schools in Uruguay were appointed by the party's foreign organization in Germany; that the party carried on an intense propaganda campaign in Uruguay; that "there exists a plan to attack this country, drawn up by an ardent propagandist of the National Socialist movement"; that the plan "contains measures tending to insure the functioning of our country as a German agricultural colony without delay or quibbling, the plan being similar in this respect to those put into effect by the Germans in their recent conquests." Private hearings before the examining magistrate began on September 23 and were still under way at the end of the year. The eight defendants remained in jail.

**Relations with Axis.** As a result of the trial and of accompanying anti-German and anti-Italian demonstrations, relations between Uruguay and the Rome-Berlin Axis became greatly strained. There had been controversy since the *Graf Spee* entered Montevideo harbor to escape British warships the preceding December (see 1939 YEAR BOOK, p. 789). On Jan. 1, 1940, the Uruguayan Government interned the German freighter *Tacoma* for the duration of the war as an auxiliary of the German Navy. When British sailors from the cruiser *Ajax* visited Montevideo on shore leave immediately afterward to celebrate their victory over the *Graf Spee*, they received a warm popular welcome. A week after the German invasion of the Low Countries, a great pro-Ally demonstration was held in the principal square of Montevideo and German shops were stoned. Anti-Italian demonstrations broke out when Italy entered the war. On August 24 the celebration of Uruguay's independence day was the occasion for another great demonstration against both Germany and Italy.

On July 22 the Uruguayan Foreign Office in a sharp note to the German Minister warned him that German diplomatic agents would not be permitted to serve as officials of Uruguayan Nazi organizations. Following the Havana Conference, Pedro Manini Rios, chairman of the Uruguayan delegation, was appointed Minister of Interior. He launched a drive against Nazi organizations and the anti-democratic propaganda of pro-Axis Uruguayans. On September 25 he and the Minister of Defense issued a decree asking all Uruguayans to co-operate in aiding the authorities to uncover all persons and organizations affiliated with the Nazi movement. The decree declared that the Uruguayan Government had assumed the obligation under Pan American agreements to prevent political activities by foreigners antagonistic to American

democratic institutions. Five days later the Minister of Interior demanded the resignation of the heads of the Montevideo police and detective departments, apparently because of their complacent attitude toward the Nazi menace.

These developments brought threats of reprisals from the German and Italian press, but Uruguayan opinion grew steadily more pro-British. The British auxiliary cruiser *Carnarvon Castle* was allowed to stay 72 hours in Montevideo harbor on December 8-10 to repair damage sustained in a clash with a German raider. A British trade mission received a hearty welcome on December 22. Leading newspapers urged the government to abandon neutrality in favor of "non-belligerency" in order to permit unrestricted use of Montevideo harbor by British warships patrolling the South Atlantic.

**United States Negotiations.** The German conspiracy brought Uruguay into unprecedentedly close political and military relations with the United States. Economically the two countries had appeared to be drifting apart as a result of the collapse of negotiations for a reciprocal trade pact on January 8 and the continuance of Uruguayan restrictions on imports from the United States. Uruguay's appeal for aid from Washington in June met a prompt response insofar as naval and military aid was concerned. But the United States rejected Uruguay's request for a \$7,000,000 loan with which to rearm. This was said to have influenced the Uruguayan Government to exercise caution in dealing with the Nazi issue, despite the declaration of the United States Minister to Uruguay on June 23.

"I am authorized to state," the Minister said, "that it is the intention and avowed policy of my government to co-operate fully, whenever such co-operation is desired, with all of the other American governments in crushing all activities which arise from non-American sources and which imperil our political and economic freedom."

At the same time two United States officers, authorized by Washington to work out details of possible American military, naval, and air aid to Uruguay, offered to furnish land as well as naval forces if needed. The question of creating naval and air bases in Uruguay to facilitate such aid was also raised informally. Uruguayan officials were said to have replied that they would consider this only if the bases were made available to all of the Pan American republics. Consultations on this and other aspects of joint military-naval-air co-operation were continued during the visit to the United States in October of Gen. Marcelino Bergalli, Inspector General of the Uruguayan army, and Col. Oscar Gestido, commander of the air force.

On November 11 the government at Montevideo announced plans for the construction of naval or air bases in co-operation with other American republics, i.e. with the financial and technical aid of the United States. They were to be "directed, maintained, and controlled" by the Uruguayan Government and "placed at the disposition of another American republic only in a pressing continental military defense necessity upon conditions established by the government." Despite the political opposition encountered in Congress (see below under *Internal Politics*), the government proceeded with its plans. On December 29 a decree created a commission of army officers to plan and supervise construction of a military air base near the capital. A credit of \$7,500,000, to be used partly for the construction of bases and purchase of military

equipment, was obtained from the Export-Import Bank in Washington in December.

**Accord with Argentina.** Uruguay's negotiations with the United States aroused some apprehension in Argentina over the possible consequences of Uruguayan bases controlling the entrance to the Rio de la Plata. The issue was discussed by the Uruguayan and Argentine Foreign Ministers meeting at Colonia, Uruguay, on December 11-14. On December 14 the Ministers reached an agreement for the co-operation of their governments in preparations to defend that part of South America against aggression from overseas. Closer trade relations also were envisaged. It was agreed to invite neighboring republics, especially Brazil and Paraguay, to join in this enterprise. The accord stipulated that the defense of the Rio de la Plata zone was to be studied in co-operation with "continental forces" without endangering the territorial integrity of either party.

**Internal Politics.** The Nazi conspiracy also had important internal consequences. A serious political crisis developed early in the year as a result of Congressional apathy and refusal to consider a number of important bills submitted by the Baldomir Government. One of these measures, inspired by Uruguay's defenselessness during the *Graf Spee* incident, called for establishment of compulsory military training and the purchase of additional naval vessels. Congress's failure to act on this bill caused Defense Minister Alfredo Campos to resign in protest on February 23. Accusing Congress of hamstringing legislation, President Baldomir demanded revision of the 1934 Constitution to increase the Presidential powers. When Congress refused even to debate this proposal, talk arose of a military coup by the President to remove the recalcitrant legislature.

A compromise was finally reached whereby the President named a new Defense Minister acceptable to Congress and that body undertook to act on administration measures. The debate over Nazi and "fifth column" activities that developed soon afterwards raised new difficulties for President Baldomir, as his administration was partly dependent upon the support of the seemingly pro-Nazi *Herrerista* faction of the Blanco party. Nevertheless the pressure of public opinion caused the resignation on June 27 of Minister of Interior Manuel Tiscornia because of his weak handling of the Nazi menace, and even Sen. Alberto de Herrera was forced to abandon his opposition to conscription. The compulsory service bill was finally adopted July 11, after more than 70,000 men had already volunteered for military training. In September the *Batllista* faction of the Colorado party voted to end its policy of non-co-operation with the government, adopted in 1933. This was considered further evidence of the reviving vigor of Uruguay's democratic institutions.

The government's acceptance of United States offers of assistance in constructing naval and air bases was approved by three *Herrerista* members of the cabinet but was denounced by their party as an infringement upon Uruguay's sovereignty. Pro-Fascist groups in Uruguay and Argentina and the government-controlled press in Spain also joined in the outcry, charging that "Yankee imperialism" was scheming to establish domination over South America under the guise of promoting continental solidarity. Although the Uruguayan Government gave repeated assurances that the agreement with the United States in no way infringing upon Uruguay's sovereignty, the Senate

on November 21 adopted a resolution, 25 to 1, stating that it would "in no case lend its support to any treaty or convention that applies to the establishment of air and naval bases in a manner lessening the country's sovereignty."

The government proceeded with its plans, which were approved by the Chamber of Deputies on November 27 by a vote of 53 to 21. The three Herrerista members of the Cabinet resigned on December 12 over the issue, but on Jan. 1, 1941, the government announced that the Herrerista party had withdrawn its opposition and concluded a political truce with President Baldomir that would permit the three cabinet officials to retain their posts. See ARGENTINA under *History*; FASCISM; PAN AMERICANISM.

**USHA.** See HOUSING AUTHORITY, U.S.

**U.S.S.R.** See UNION OF SOVIET SOCIALIST REPUBLICS.

**UTAH.** Area, 84,990 square miles; includes water, 2806 square miles. Population (U.S. census), April, 1940, 550,310; 1930, 507,847. Salt Lake City, the capital: (1940) 149,934. The State's predominant urban population (dwellers in places of 2500 or over) increased further (1930-40), by 39,229, or 14.7 per cent, to 305,493, or 55.5 per cent of the whole population; while the rural group increased by only 3234, to 244,817.

**Agriculture.** Utah harvested, in 1940, 1,042,000 acres of the principal crops. Tame hay, on 513,000 acres, bore 1,062,000 tons (\$8,708,000 in estimated value to the farmer; wheat, 251,000 acres, made 4,861,000 bu. (\$3,014,000); sugar beets, 48,000 acres, 506,000 tons (\$2,828,000 for 1939's considerably greater crop); potatoes, 12,000 acres, 2,040,000 bu. (\$1,040,000); barley, 76,000 acres, 2,812,000 bu. (\$1,265,000). Farms numbered 25,411 in 1940 and averaged 287.4 acres.

**Mineral Production.** Yearly production of native minerals in Utah, as estimated in 1940 by the U.S. Bureau of Mines, totaled \$59,236,355 for 1938, which was less than three-fifths of the total for 1937. The quantity of copper in the ores mined yearly diminished to 216,252,000 lb. for 1938, then increased to 343,780,000 lb. for 1939 and to 459,846,000 approximately, for 1940; totals by value, \$21,192,696 (1938), \$35,753,120 (1939), and \$51,962,598 (1940). Corresponding figures for gold, 200,630 oz. (1938), 277,751 (1939), and 352,770 (1940); by value, \$7,022,050 (1938), \$9,721,285 (1939), and \$12,346,950 (1940). Both copper and gold (1940) exceeded all prior yearly quantities in Utah's record. Totals for gold mounted with those for copper because much of the gold occurred in ores mined principally for copper. Other metals extensively mined were silver, 12,266,138 oz., value approximately \$8,722,587 (1940); 154,094,000 lb. of lead, value about \$7,704,700 (1940), and zinc, 87,746,000 lb., value \$5,703,490 (1940). Of coal, the mines produced 3,524,000 tons in 1940, as against 1938's 2,946,951 tons (valued at \$6,875,000).

**Education.** For the academic year 1939-40 Utah's inhabitants of school age were reckoned at 143,537, from 6 to 17 years old. The year's registrations of public-school pupils numbered 137,434: in elementary study, 78,394; in high school, 59,040. The year's expenditure for public-school education totaled \$9,754,606, current; \$13,271,541, all. The 4608 teachers' salaries for the year averaged \$1376.19.

**History.** The rise of about 8.4 per cent in Utah's population during the ten years 1930-40 indicated that the prolonged depression of the mining industries, through much of that period,

and the consequent widespread lack of employment had passed without permanently upsetting the economy of the State. The condition of the inhabitants in 1940 improved by reason of further increase in mining and allied activity.

A noteworthy event in partisan politics was the Democrats' repudiation of the veteran U.S. Senator William H. King. Seeking the Democratic nomination for a fifth term, King was defeated at the primary election (September 3) by Representative Abe Murdock in nearly a 3-to-1 vote. King had lost his popularity by opposing many of the New Deal's policies; his victor offered a record of legislative compliance with the recommendations of the Federal Administration.

At the general election (November 5) the popular vote for President went to Roosevelt (Dem.) by a total of 154,277, to 93,151 for Willkie (Rep.). Democrats won the other chief contests on the ticket: for U.S. Senator, Abe Murdock (Dem.) defeated Philo T. Farnsworth (Rep.); Democrats were elected to both seats in the U.S. House of Representatives; and for Governor, Herbert B. Maw (Dem.) defeated Don B. Colton (Rep.).

**Officers.** Utah's chief officers, serving in 1940, were: Governor, Henry H. Blood (Dem.); Secretary of State, E. E. Monson; Auditor, John W. Guy; Treasurer, Reese M. Reese; Attorney-General, Joseph Chez; Superintendent of Public Instruction, Charles H. Skidmore.

**UTILITIES.** See FINANCIAL REVIEW under *Financial Regulation*; UNITED STATES under *Administration*; also ELECTRIC LIGHT AND POWER, GAS INDUSTRY, etc.

**UZBEK SOVIET SOCIALIST REPUBLIC.** See UNION OF SOVIET SOCIALIST REPUBLICS under *Area and Population*.

**VATICAN CITY.** A sovereign State, officially known as the State of Vatican City, established within the city of Rome as the seat of the Papacy on June 10, 1929, in accordance with the Italo-Vatican (Lateran) Treaty of Feb. 11, 1929 (see 1929 YEAR BOOK, p. 417). Sovereign in 1940, Pope Pius XII (Eugenio Pacelli), who succeeded Pius XI Mar. 2, 1939.

The area of Vatican City is 108.7 acres, including St. Peter's Square, and in addition 13 ecclesiastical buildings outside of its limits enjoy extraterritorial rights. It has its own coinage, import duties, railway station, and its postal, telegraph, and radio facilities. The census of 1939 showed 953 inhabitants. Under the Constitution of June 7, 1929, the Pope exercises full legal, judicial, and executive powers. Pius XII placed the administration of Vatican City and its civil offices in the hands of a commission of Cardinals headed by Cardinal Canali. The legal system is based on canon law and ecclesiastical rules.

Foreign relations are conducted by the Secretary of State. (Cardinal Luigi Maglione was appointed to this office Mar. 11, 1939.) The Holy See maintains diplomatic relations with 35 governments and has unofficial relations by means of Apostolic Delegates with a number of other countries, including the United States.

**History.** Italy's entrance into the European War on June 10, 1940, confronted the Vatican with the necessity of adjusting its relations with the Italian Government under the Lateran Treaty of 1929 to the fact of Italian belligerency. Some friction had developed earlier in the year as a result of Fascist resentment at the publication by the Vatican of denunciatory reports on German rule in Poland and of war news from all of the

belligerents. As the only news organ circulating in Italy exempt from government censorship, the semi-official Vatican newspaper *Osservatore Romano* increased rapidly in circulation. Its issue of May 11, containing the Pope's message to the rulers of Belgium, the Netherlands, and Luxemburg condemning the German invasion, sold 180,000 copies.

Government protests forced the newspaper at the beginning of June to cease printing political news and editorials, and when Italy declared war it was announced that war communiqués and other official bulletins of all the warring powers would be omitted for the duration of the conflict. As a result, the circulation of *Osservatore Romano* dropped from about 120,000 to 28,000 in less than two months. Following its policy of strict neutrality, Vatican authorities on June 20 forbade political discussions on international affairs in public premises within Vatican City. They established censorship over the Vatican telephone exchanges on Italy's war declaration, and on October 25 extended the censorship to include mail passing through Vatican City postoffices.

The Papal Secretary of State asked the Italian Government "to continue to extend all the customary prerogatives and immunity to the diplomats of belligerent countries accredited to the Holy See and that their seats remain on Italian territory." When this request was rejected, the British, French, Polish, and Belgian Ambassadors to the Holy See moved on June 13 to residences within Vatican City where they remained incommunicado from their governments. On August 1 the Pope granted Vatican citizenship to all papal diplomatic representatives abroad. Most of them being Italians, Vatican citizenship gave them greater freedom of action.

Referring to the international situation on July 10 for the first time since Italy's declaration of war, the Pope urged Germany and Italy to grant France lenient peace terms that would not foster hatred. The *Osservatore Romano* announced July 18 that the Pope had appealed to the British and French Governments to spare Rome from bombing raids in view of its sacred character. He received assurances that the churches and buildings within Vatican City would not be bombed, but the British reserved the right to bomb other parts of Rome. The Vatican's sympathy and approval of the Pétain regime in France was expressed several times in *Osservatore Romano* during July.

See BELGIUM, FRANCE, GERMANY, ITALY, LITHUANIA, MEXICO, and SPAIN, under *History*; ROMAN CATHOLIC CHURCH.

**VEGETABLES.** See **HORTICULTURE.**

**VENEREAL DISEASE.** See **PUBLIC HEALTH SERVICE.**

**VENEZUELA.** A republic of South America, consisting of a Federal District, 20 States, and two Territories. Capital, Caracas.

**Area and Population.** Area, 352,143 square miles; population, 3,491,159 at December, 1936, census (3,552,000, estimate for June, 1938). There are whites, Indians, Negroes, and mixtures of all three races. Registered births in 1939 numbered 129,482 (91,836 in 1938); marriages, 16,005 (8881 in 1935). Populations of the capital and five largest State capitals in 1937 were: Caracas (Federal District), 203,342; Maracaibo (State of Zulia), 110,010; Barquisimeto (Lara), 50,774, Valencia (Carabobo), 49,963; Maracay (Aragua), 29,255; and San Cristóbal (Tachira), 22,058. United States citizens resident in Venezuela on Jan. 1, 1940, num-

bered 3357. During 1939, 1583 immigrants entered the country exclusive of more than 600 Venezuelans repatriated at government expense.

**Defense.** As of Nov. 1, 1940, the active army numbered 11,000 men; trained army reserves, 7500; active air force, 373. The navy comprised 6 gunboats and patrol vessels and several auxiliary craft. The defense appropriation for 1939-40 was 42,111,000 bolívares.

**Education and Religion.** At the 1926 census, about 57 per cent of the adult population were illiterate. Out of an estimated school-age population of 720,000 in 1939, 295,462, or 41 per cent, were registered in classes, as against 19.9 per cent of the school-age population in 1936. There were 4142 public primary schools (1938) with 234,024 pupils; 65 secondary and special schools, with 3705 pupils; and three universities, with 2125 students. Roman Catholicism is the predominant religion.

**Production.** The principal industries are agriculture, stock raising, petroleum mining, manufacturing, pearl fishing, and forestry. Production of the chief crops was: Coffee, 835,562 bags (of 101.43 lb.) in 1939-40; cacao, 15,378 metric tons (exports in 1939); cane sugar, 24,500 metric tons in 1938-39. Tobacco, cotton, corn, beans, fruits, potatoes, coconuts, rice, and wheat are other leading crops. Petroleum production in 1939 was 207,055,000 bbl., giving Venezuela second rank among world producers; gold, 4440 kilograms (kilo equals 2.2 lb.). Some salt, copper, coal, iron, tin, and asbestos are mined. The forests yield balata, tonka beans, divi-divi, vanilla, etc. At the end of 1936 there were 3285 industrial establishments with 27,500 workers. Oil refining is the only large-scale industry.

**Foreign Trade.** Imports in 1939 totaled 324,751,802 bolívares (310,949,240 in 1938); exports, 953,337,086 (887,275,955). Petroleum and its products accounted for over 90 per cent of all exports and coffee and cacao for most of the remainder. Of the 1939 imports, 59 per cent by value came from the United States, 7.8 per cent from Germany, and 6.7 per cent from the United Kingdom. The bulk of the petroleum exports went to Aruba and Curaçao for refining. The United States took 15.8 per cent of the direct exports; United Kingdom, 5.2 per cent; Germany, 2.5 per cent.

**Finance.** The budget for the fiscal year ended June 30, 1941, reduced estimated revenues and expenditures to 344,515,000 bolívares from the 1939-40 estimates of 361,325,000 bolívares. Further reductions in expenditures, estimated at 33,000,000 bolívares, were instituted Oct. 1, 1940, covering the balance of the 1940-41 fiscal year. There was a surplus of 17,725,000 bolívares in 1937-38 and a deficit of 20,166,000 bolívares in 1938-39. Treasury reserves on Apr. 15, 1940, amounted to 42,657,500 bolívares. The public debt was about 3,000,000 bolívares on Dec. 31, 1938. Average exchange rate of the bolívar in 1939: Bank rate, \$0.3135 (\$0.3135 in 1938); open market rate, \$0.3115 (\$0.3067).

**Transportation.** The railways, with 589 miles of line (exclusive of 62 miles of oil company line), carried 981,850 passengers and 453,843 metric tons of freight in 1939. Highways extended 5882 miles (315 miles completed in 1939). The Mene Grande-Motatán highway, connecting link between Maracaibo and the Trans-Andean Highway at Motatán, was opened in July, 1940. The government-owned airways system, with over 2560 miles of route, carried 10,740 passengers and 52,656 lb. of mail during 1939; total mileage flown was 462,968. Pan American Airways planes touch

at Caripito, Guanta, La Guaira, Coro and Maracaibo. La Guaira, Puerto Cabello and Maracaibo are the chief ports. A contract for the construction of a new oil terminal and dock at Puerto de la Cruz for the use of the newly opened oil fields and pipe line in Eastern Venezuela was awarded in 1940.

**Government.** The Constitution of July 11, 1936, vests executive powers in a President elected by Congress for five years and ineligible for re-election. There is a Senate of 40 members chosen by the State legislatures and a Chamber of Deputies of 85 members elected by municipal councils. The State legislatures and municipal councils are elected by direct ballot of literate males 21 or more years of age. The Constitution prohibits communism and anarchism. President in 1940, Gen. Eleazar López Contreras (elected by Congress Apr. 25, 1936, after having been named Provisional President by the cabinet on Dec. 18, 1935, upon the death of the Dictator-President, Gen. Juan Vicente Gómez).

**History.** President López Contreras continued during 1940 to guide Venezuela successfully and peaceably in the direction of what he called "Bolivarian democracy" and away from the harsh dictatorship of his predecessor. That this transition was not complete was indicated in March by the action of the governor of the Federal District in imprisoning a well-known columnist, Enrique Bernardo Núñez of the newspaper *El Universal* in Caracas, for alleged disrespect to the President, and in fining the publisher. The governor objected to the fact that the columnist had compared two speeches praising democracy—one by President López Contreras and the other by the exiled Venezuelan leftist, Rómulo Betancourt. Two other Venezuelan newspapers joined *El Universal* in protesting the governor's arbitrary action. The Federal Government, however, took no notice of the incident.

The general satisfaction with the President's leadership was reflected in demands that he become a candidate for a second term, despite the constitutional bar against re-election. However General López Contreras reiterated his intention to retire upon the expiration of his term on Apr. 25, 1941. Local elections held in 13 of the 20 States in November gave some 65 per cent of the votes to a group of parties supporting the national government. This suggested that a successor endorsing President López Contreras's policies would be selected in 1941.

The prosperity of 1939 showed some decline in 1940 as a result of the curtailment of petroleum, coffee, and other exports by the spreading European War. Due to the republic's excessive dependence upon the oil industry, the press and government showed alarm when the Standard Oil Company began to reduce production because of declining markets. Unemployment of oil workers caused a revival of radical agitation in the Maracaibo district. However the government continued its extensive public works program, aided by funds advanced by the oil companies in consideration of the abolition in 1938 of certain vexatious special fees. The decline in oil production was offset in part by an increased demand for metals needed by the U.S. armament industries. Early in the year a large American steel company commenced the development of iron ore deposits south of the Orinoco River.

The increasing shortage of foreign exchange led the government on June 26 to abolish the free exchange market and expand the exchange control

system to cover all transactions. Nevertheless the exchange rate of the bolivar continued to decline (from \$0.3162 cents in July to \$0.25) and on October 25 a system of import licenses was introduced to curtail imports further. Toward the close of the year the government negotiated a loan, reported at \$10,000,000, from the National City Bank of New York to pay for essential imports and liquidate commercial arrears. Petroleum production in November reached the lowest level in three years, but this adverse influence was partly offset by the new inter-American coffee cartel program, under which Venezuela was authorized to ship 420,000 bags annually to the United States as against 220,800 bags in 1939-40.

In furtherance of the President's Three-Year Plan of social and economic reform, the government completed preparations for the establishment of a compulsory social security law. In October the new Central Bank, authorized in 1939, began operations. See LEAGUE OF NATIONS; PAN AMERICANISM.

**Foreign Relations.** Venezuela's resignation from the League of Nations became effective July 18, 1940. The withdrawal from the Geneva organization coincided with increasing political, economic, and military collaboration with the other American republics and particularly the United States. The European War came close to Venezuela when British and French forces in May occupied the Netherlands' colonies of Curaçao (qv) and Aruba where most of Venezuela's oil is refined. Subsequently War Minister Isaías Medina made a tour of U.S. defense establishments and conferred with North American civil and military officials on hemisphere defense plans. The reciprocal trade treaty signed by the United States and Venezuela on Nov. 6, 1939, went into effect Dec. 14, 1940, following its ratification. A quarrel with the government of the Dominican Republic over alleged indignities inflicted on Venezuelan citizens in that country led Caracas authorities to boycott the Second Caribbean Conference held in Ciudad Trujillo in June. Annulment of the Japanese-Venezuelan trade pact on June 30 caused a setback to Japanese trade with the republic.

**VENTILATING.** See HEATING AND VENTILATING; also, ELECTRICAL INDUSTRIES under *Air Cleaning*.

**VERMONT.** Area, 9564 square miles, includes water, 440 square miles. Population (U.S. Census), April, 1940, 359,231; 1930, 359,611. Burlington (1940), 27,686; Montpelier (the capital), 8006. The urban population (dwellers in places of 2500 or more) increased (1930-40) by 4473, to 123,239; the rural group diminished by 4853, to 235,992.

**Agriculture.** Vermont harvested, in 1940, 1,093,300 acres of the principal crops. Nearly 6 out of 7 acres in this area grew tame hay; corn, the next crop for extent, covered only one in 15. Tame hay, on 932,000 acres, bore 1,113,000 tons (\$11,241,000 approximately in estimated value to the farmer). Corn, 71,000 acres, made 2,627,000 bu. (\$1,918,000), potatoes, 15,300 acres, 2,142,000 bu. (\$1,585,000), oats, 55,000 acres, 1,760,000 bu. (\$898,000); apples for market, 413,000 bu. (\$454,000). Farms numbered 23,582 in 1940 and averaged 155.5 acres.

**Mineral Production.** Production of the minerals native to Vermont totaled \$6,439,552 for 1938. Stone and slate (which were totaled separately) contributed three-fourths of this amount. Producers of stone sold or used 232,770 short tons in 1939,

somewhat less than the total of 264,480 tons for 1938: but by yearly value the total rose to \$3,412,005 (1939), from \$3,148,950 (1938). Almost all of these amounts was for relatively small quantities of costly stone: granite for monuments, 689,600 cu. ft., worth \$2,051,251, was sold or used in 1939; the corresponding totals for blocks of monumental and building marble were 228,550 cu. ft., \$1,038,351. The production of slate attained about \$1,948,000 for 1939; of the total, some 106,500 squares of roofing slates contributed nearly \$764,000.

**Education.** For the academic year 1939-40, Vermont's inhabitants of school age (from 6 years to 18) were reckoned at 77,235. The year's enrollments of pupils in the public schools numbered 62,908; this lacked 3062 of the enrollments reported for the year before. Enrollments of elementary pupils in the year 1939-40 numbered 45,981; those in high school, 16,927. Outside the ordinary public-school system, over 900 pupils were studying vocational courses, while 11,000 or more other pupils were in private schools. The year's expenditure for public school education totaled \$5,800,000, the teachers, 2745 in number, averaged \$982.46 in yearly pay.

**History.** Vermont's experiment in helping a railroad to keep going entered a stage of litigation and uncertainty. The Rutland Railroad Company seemed to be operating without further current loss under the plan of 1938 (see 1939 YEAR BOOK, p. 793), by which taxing authorities, bondholders, and employees of the line all made concessions, with a Federal District Court's approval. Suit was brought, however, in the Federal Circuit Court at New York, to compel the line's payment of full wages, both current and in arrears. The Court ordered (February 13) that the line pay the whole accumulation of the deficiency in wages since July 30, 1938; this deficiency averaged 17 per cent and added up to \$455,722, a sum in excess of the receiver's entire cash on hand. The Court, on declaration that enforcement of the order would compel operation to cease, granted (March 18) a stay, expected to last until completion of the line's appeal to the U.S. Supreme Court. The future of the unusual venture in operation by composition with employees remained uncertain.

The death of U.S. Senator Ernest W. Gibson left a seat to be filled by election; Gov. George D. Aiken won the Republican nomination for this seat in the primary elections (September 10); U.S. Senator Warren R. Austin was renominated for another term.

**Elections.** At the general election (November 5) the vote was consistently Republican. The popular vote for President totaled 78,371 for Willkie (Rep.); 64,269 for Roosevelt (Dem.). For Governor, William H. Wills (Rep.) defeated John McGrath (Dem.). For U.S. Senator, full term, Warren R. Austin (Rep.) was re-elected, over Ona S. Searles (Dem.); for Senator, unexpired term, Governor George D. Aiken (Rep.) defeated Herbert B. Comings (Dem.).

**Officers.** Vermont's chief officers, serving in 1940, were: Governor, George D. Aiken (Rep.); Lieutenant Governor, William H. Wills; Treasurer, Thomas H. Cave; Secretary of State, Rawson C. Myrick; Auditor, Benjamin Gates; Attorney General, Lawrence C. Jones; Commissioner of Education, Francis Bailey.

**VETERANS.** See VETERANS ADMINISTRATION; also, CIVIL SERVICE COMMISSION; RED CROSS.

**VETERANS' ADMINISTRATION.** As of June 30, 1940, there were in force 608,923 United States Government life insurance policies representing \$2,564,984,223 of insurance. During the fiscal year 1940, there were issued 52,713 new policies aggregating \$144,315,328. The actual disbursements made during the fiscal year 1940, to policy-holders of this form of insurance was \$69,812,755. Military and Naval insurance covers contracts held by veterans of the World War for a form of insurance formerly designated as "War Risk" insurance. The disbursements for this type of insurance totaled \$19,601,577 during the fiscal year 1940.

During the fiscal year 1940, 235,264 United States veterans received hospitalization, 179,497 being admitted during the fiscal period. As of June 30, 1940, 56,596 United States veterans were receiving hospitalization. These veterans were classified by wars as follows: World War, 50,912; Spanish American War, 2900; Civil War, 37; Regular Establishment, 2679; and all other wars, expeditions and occupations, 68.

At the close of the fiscal year 1940, the veteran population reported as present in domiciliary status in facilities under the control and jurisdiction of the Veterans' Administration totaled 16,518. Of this number approximately 92.27 per cent were veterans of the World War; 4.55 per cent, Spanish American War; 3.06 per cent, Regular Establishment; and 0.12 per cent, other wars, expeditions, and occupations.

The following table shows the number of pension and compensation cases of living and deceased veterans by wars including Regular Establishment and Honor Roll—Yellow Fever Experiments as of June 30, 1940, and the disbursements during the fiscal year 1940

War	On Roll June 30, 1940	Disbursements Fiscal Year 1940
Honor Roll—Yellow Fever Experiments		
Living veterans	10	\$ 15,000 00
War of 1812		
Deceased veterans	1	240 00
Mexican War		
Deceased veterans	130	84,613 33
Indian Wars—Total	6,271	3,177,954 84
Living veterans	2,216	1,694,482 65
Deceased veterans	4,055	1,483,472 19
Civil War—Total	52,522	27,790,252 93
Living veterans	2,381	3,158,998 10
Deceased veterans	50,141	24,631,254 83
Spanish American War—Total	216,950	127,427,375 83
Living veterans	159,230	106,203,201 30
Deceased veterans	57,720	21,224,174 53
Regular Establishment—Total	46,177	15,811,766 25
Living veterans	36,051	12,728,872 47
Deceased veterans	10,126	3,082,893 78
World War—Total	527,247	254,846,261 38
Living veterans	410,244	190,648,859 39
Service connected	348,164	168,387,884 83
Non-service connected	60,296	19,324,715 45
Emergency Officers	1,784	2,936,259 11
Deceased veterans	117,003	64,197,401 99
Service connected	99,479	56,799,064 01
Non-service connected	17,524	7,398,337 98
Grand Total—Pensions and Com-		
pensation	849,308	\$429,153,464 56
Living veterans	610,132	314,449,413 91
Deceased veterans	239,176	114,704,050 65

During the fiscal year 1940, the total disbursements made by the Veterans' Administration from all appropriations and trust funds (including adjustments on lapsed appropriations) was \$639,126,697.

FRANK T. HINES.

**VETERINARY MEDICINE.** Success rewarded the efforts of disease control workers in

the field of comparative medicine. None of the livestock diseases that have from time to time wrought havoc among the herds of other continents gained entrance to the United States, and the progress of eradication of insidious diseases within was most gratifying to the authorities in charge. The completion of the campaign of eradication of tuberculosis from the dairy and beef herds of the United States, a co-operative project of the Federal and State governments, which was announced on December 2 after twenty-three years of constant effort, represents one of the outstanding events of history in the advancement of the welfare of a people, both from its economic and its public health benefits—physicians having credited it with much of the recent decrease in human tuberculosis. Particularly noteworthy was the action taken at the seventy-seventh annual meeting of the American Veterinary Medical Association held at Washington in August adopting a plan for the control of rabies in the United States, authorizing the publication of a quarterly American Journal of Veterinary Research that commenced issue October 15, and the selection of Dr. I. Forest Huddleson of Michigan as the 1940 recipient of the Twelfth International Veterinary Congress Prize for his investigations of brucellosis.

**Brucellosis or Bang's Disease, Eradication.** Announcement was made on February 2 of the practical eradication of Bang's disease from the dairy and breeding cattle in 209 counties of 17 States containing some 1,560,000 animals six months of age and over. In the co-operative Federal-State project the area plan used in the eradication of tuberculosis was followed. The method of accrediting areas has the particular merit of protecting breeders who desire to eradicate the disease, against possible infection from adjacent farms. Applied usually to a county the plan consists in testing all cattle six months of age or more, except steers. When the degree of infection in such an area is found at not more than 1 per cent of such cattle and to occur in not more than 5 per cent of the herds, the area may be officially declared a modified accredited Bang's disease-free area. This procedure was adopted and approved in December, 1939, and by July 1, 1940, there were 298 counties in twenty States so classified. The owners of cattle that react to the official test for Bang's disease and that are disposed of by slaughter, receive all the salvage, and in 35 States they also receive some payment, as partial compensation, from the State and Federal Governments. The average salvage for the year was about \$35, the average Federal payment \$15, and the average State payment \$17.15. The amount paid by the Federal Government cannot exceed that paid by the State or other co-operating agency. While the test-and-slaughter plan of suppression adopted in July, 1934, has resulted in much progress and the provisions will undoubtedly be continued in the future, the U.S. Bureau of Animal Industry, through which the work is conducted, has announced that it is prepared to approve a suitable plan that will incorporate the vaccination of calves at the proper age as an adjunct. This is the outcome of investigational work which has shown that calves vaccinated when from five to seven months of age with the BAI strain 19 of *Brucella abortus* that has been developed possess a rather high immunity to infection and do not become carriers. In Canada the interest of stock owners in the control of Bang's disease was on the increase, with 2134 herds in nine Provinces under supervision and 1027 listed as disease free.

**Equine Encephalomyelitis, Infectious.** From the 184,000 outbreaks of sleeping sickness of the horse in the United States in 1938 and 8000 in 1939 there was a reduction to 4500 in 1940, about half of which occurred during late September and early October. The low incidence was attributable to the dry weather during the summer in many sections being unfavorable to transmission by mosquitoes and to the protective vaccination that was used.

**Necrotic Enteritis of Swine.** Experimental work with the affection of swine now known as infectious necrotic enteritis has suggested that it is a secondary complication due to the intestinal invasion of *Salmonella choleraesuis* and probably other organisms after the symptoms of a deficiency of nicotinic acid have developed.

**Parasitology.** Investigations reported indicate that the dog flea is a potential vector of the heartworm of the dog (*Dirofilaria immitis*), suggesting that it may play a role in the transmission of this parasite of the bloodstream especially throughout portions of the South. The larvae of the red flour beetle and the confused flour beetle were successfully infected with the common poultry tapeworm *Raillietia cesticillus*. They became infected when offered the gravid segments in the presence of either a large or small amount of food, such as bran. It was shown that the process of metamorphosis of the beetles from larvae to pupae or pupae to adults does not destroy all of the cysticercoids present. The common liverfluke of cattle in Hawaii *Fasciola gigantica* was reported to be best combated through control of the snail *Fossaria allula*, a common inhabitant of fresh-water streams and swamps. The affection of turkeys due to a parasite of the white blood corpuscles, *Leucocytozoon smithi* transmitted by black flies, first recorded from Virginia, was reported to have been the cause of outbreaks in nearly all sections of Alabama in the past two years. In experimental medication of cattle for control of the horn fly, rotenone was effective in much smaller doses than any other substance and had no apparent harmful effect on the animal. A few flies emerged from droppings of cattle fed 0.3 gram per hundred body weight administered daily, all having been killed by a 0.4 gram dose. Phenothiazine was effective in doses as small as 1 gram per hundred body weight but had the undesirable quality of imparting a reddish tinge to the milk of cows. Investigations in Florida revealed the fact that both the common housefly, *Musca domestica*, and eye gnats (*Hippelates* spp.) are natural vectors of the mastitis of dairy cattle. Progress was made in the eradication of sheep scabies, in the course of which 13,825,734 inspections were made in the field and 1,406,380 dippings supervised; and with cattle scabies in five western range States where 31,069 herds were found infected, and 114,267 dippings supervised.

**Phenothiazine as an Anthelmintic.** In the search for a substance that is toxic to insects but of low toxicity to warm-blooded animals the value of the sulphur compound, phenothiazine, was discovered by investigators of the U.S. Department of Agriculture in 1935 to be particularly promising. This parent substance of many dyes, prepared from diphenylamide, a coal tar derivative, is chemically related to sulfanilamide. Experimental work in 1938 revealed it to be of exceptional value as an anthelmintic for the removal of worms from sheep and swine. The work that has followed has shown it to be one of the most versatile chemical substances brought to light in recent years. Follow-

ing litigation that arose, a patent was issued and dedicated to the public for use in the treatment of certain worm infestations of sheep, goats, swine, cattle, and horses, which heretofore have resisted medication. The drug possesses several practical advantages over other known anthelmintics, including low toxicity, greater efficiency in heavily infested than in lightly infested animals, ease of administration, and anthelmintic activity against more than one species of worm parasite. A method of administering the substance in the form of compressed tablets that disintegrate rapidly in the stomach has been developed. Used in this way the anthelmintic efficiency of the chemical is increased and it can be employed without prior fasting. Work in Washington State has led to the recommendation of its use in the removal of heterakids of chickens.

**Sulfanilamide Therapy.** While reports regarding the value of sulfanilamide in the treatment of bovine mastitis have been somewhat conflicting, it was reported from Ohio to have been found of value, especially in large herds for cows that suddenly develop an inflammation in one or more quarters, and in small herds in which mastitis appears quite frequently. In preliminary work reported, it appeared to be of value in the treatment of calf diptheria and perhaps other affections due to or associated with *Actinomyces necrophorus*. It proved to be highly effective in septicemic diseases of the dog when given in initial daily doses of one grain per pound body weight divided into four doses. Report came from Australia of its high value when administered to horses suffering from severe hemolytic streptococcal infections, although no benefit resulted in a case of strangles. Experimental tuberculosis work with the rabbit at the Johns Hopkins Hospital confirmed the results of earlier work with the guinea pig, demonstrating that adequate doses of sulfanilamide properly administered has a definite inhibitory effect upon the development of the infection. An outstanding cure of a case of horse sickness resulting from the administration of prontosil was reported from South Africa. Sulfapyridine, like sulfanilamide, proved effective when used against several species of coccidia affecting the chicken although neither drug is effective against the two most destructive species, *Eimeria tenella* and *Eimeria necatrix*.

**Tick Fever and Cattle Tick Eradication.** The eradication campaign against the cattle-fever tick which has been under way since 1906 was continued in the remaining infested areas of Florida, Texas, Puerto Rico, and the Virgin Islands. During the fiscal year ended June 30, the whole or remaining parts of two counties in Florida and seven counties in Texas with an aggregate area of 1135 square miles and the middle one-third of Puerto Rico covering an area of 373 square miles were released from quarantine. Parts of three counties in Texas aggregating 373 square miles were quarantined. During the fiscal year a total of 16,214,872 inspections or dippings of cattle and 1,592,317 inspections or dippings of horses and mules were conducted. It was necessary in Puerto Rico and the Virgin Islands, where the tropical variety of the cattle-fever tick is prevalent, to treat the sheep and goats and a few deer on infested premises and 1,278,921 inspections or dippings of these animals were conducted. On July 1 only 1 per cent of the area in the 985 counties placed under Federal quarantine in 1906, and this all in twelve counties, remained to be freed of the cattle-fever tick. Cattle-tick infested deer continued

to be the most troublesome phase in the four remaining infested counties in Florida.

**Toxicology.** In feeding experiments to determine the minimum lethal dose of selenium, as sodium selenite, for livestock, the findings were as follows: for the horse and mule 1.5 milligram per pound of body weight, for the cow between 4.5 and 5.0 milligrams, for 4 to 6 months old pigs between 6.0 and 8.0 milligrams. *Peganum harmala*, a plant known as Syrian or African rue that has lately appeared and become abundant on a section of land in New Mexico, was proved to be poisonous to stock. Wheat screenings containing nutlets of *Amsinckia intermedia*, a plant that grows abundantly in grain fields in certain semiarid regions of Washington, Oregon, and Idaho, was proved to be toxic to horses, cattle, and swine. The condition produced, hepatic cirrhosis, as it occurs in cattle and swine is known locally as hard liver and in horses as walking disease.

**Tuberculosis Eradication, Bovine.** With the release of the three remaining counties of California, Puerto Rico, and the Virgin Islands the campaign for eradication of tuberculosis from the cattle herds of the United States was brought to a successful close. This milestone of progress in the advance of public health and the prevention of economic loss took its place on December 2d, at which time each and every county in the United States and the Territories of Puerto Rico and the Virgin Islands were declared to be modified accredited areas. This means that the degree of infection in every county of every State of the Union has been reduced to less than one-half of 1 per cent, signifying practical eradication. In the course of this work more than 232 million tests and retests were made and about 4 million diseased cattle were detected and removed for slaughter. Future work will consist in precautionary retesting to safeguard the health of herds against possible reinfection and a new spread of the disease. Work with the avian type of the disease which menaces the poultry and swine industries in the Central and North Central States was continued. It was found in an investigation in England following an outbreak of avial tuberculosis among the stock in a well managed poultry establishment that from 1.3 to 4.8 per cent of the starlings were infected with the organism. Substantial progress was made in the bovine tuberculosis eradication work in all the Provinces of Canada.

**Bibliography.** Among the publications of the year were: D. J. Anthony, *Diseases of the pig and its husbandry* (Baltimore, 1940); B. W. Bierer, *American Veterinary History* (Vols. I-IV, Baltimore, 1940); W. D. Frost and M. A. Engelbrecht, *The streptococci: Their description, classification, and distribution, with special reference to those in milk* (Madison, Wisc., 1940); W. A. Hagan, *An outline of lectures on pathogenic bacteriology, and immunity with relation to the domestic animals* (Ann Arbor, 1939, rev. ed.); I. A. Merchant, *Veterinary bacteriology* (Ames, Iowa, 1940); H. J. Mills, *Practical veterinary pharmacology, materia medica, and therapeutics* (Chicago, 1940, 4 ed.); J. A. Myers, *Man's greatest victory over tuberculosis* (Minneapolis, 1940); C. Nelva, *Moléstias dos suínos* (São Paulo, 1940); C. Olson, Jr., *Transmissible fowl leucosis: A review of the literature* (Mass. Exp. Sta. Bull. 370, Amherst, Mass., 1940); and W. L. Williams, *Veterinary obstetrics* (Ithaca, N. Y., 1940, 3 ed.).

WILLIAM A. HOOKER.

**VICALLOY.** See TELEPHONY.

**VICTORIA.** A State of Australia. Area, 87,884 square miles; population (Mar. 31, 1940), 1,896,934, exclusive of full-blood aboriginals. Vital statistics (1939): 30,493 births, 20,169 deaths, 17,368 marriages. Capital, Melbourne, 1,046,750 inhabitants (1939). Other important cities are Geelong

long, 40,050; Ballarat, 38,430; Bendigo, 30,030. Education (Dec. 31, 1937): 3391 schools and 367,848 students. In 1938 there were 3931 students attending lectures at the University of Melbourne.

**Production.** Chief agricultural crops: wheat (45,054,592 bu. in 1939-40), oats, barley, potatoes, hay, grapes. Dairy products (1938-39): 130,573,918 lb. of butter, 19,544,061 lb. of cheese, 16,510,137 lb. of bacon and ham. Livestock (1940): 18,251,870 sheep, 1,787,597 cattle, 326,217 horses, 297,655 swine. Wool (as in the grease) output (1940): 187,000,000 lb. Chief mineral output (1939): gold (£1,533,899), coal (£645,766). Manufacturing (1938-39): 9250 factories, 201,831 employees, £65,996,069 net value of production. The State railways, in 1938-39, had 4767 route miles of track open to traffic and carried 148,543,000 passengers and 5,990,000 tons of freight.

**Government.** Finance (1939-40): revenue, £27,464,000; expenditure, £27,999,000; public debt, £180,550,000. The executive authority is vested in a governor, aided by a responsible ministry. Parliament consists of a legislative council of 34 members elected for a 6-year term (17 elected every 3 years), and a legislative assembly of 65 members who are elected for a 3-year term by universal adult suffrage. Governor, Maj. Gen. Sir Winston Dugan (assumed office July 17, 1939); Premier, A. A. Dunstan. See AUSTRALIA under *History* for the standing of the political parties in the legislative assembly as a result of the State general election of Mar. 16, 1940.

**VILNA TERRITORY.** See LITHUANIA under *Area and Population and Communications.*

**VIRGINIA.** Area, 42,627 square miles; includes water, 2365 square miles. Population (U.S. Census), April, 1940, 2,677,773; 1930, 2,421,851. Richmond (the capital), 193,042 (1940); Norfolk, 144,332. The urban population—dwellers in places of 2500 or more—grew the most, increasing (1930-40) by 159,138, or 20.3 per cent, to 944,675; the rural population gaining 96,784, attained 1,733,098.

**Agriculture.** Virginia harvested, in 1940, 3,791,000 acres of the principal crops. The tendency was to raise less corn and tobacco and more tame hay. Corn, on 1,377,000 acres, bore 36,940,000 bu. (\$28,097,000 in estimated return to the farmer); tobacco, 114,000 acres, made 97,540,000 lb. (\$15,048,000); tame hay, 1,091,000 acres, 1,252,000 tons (\$15,149,000); wheat, 546,000 acres, 8,463,000 bu. (\$7,278,000); peanuts, 164,000 acres, 196,800,000 lb. (\$6,691,000); potatoes, 76,000 acres, 10,412,000 bu. (\$6,351,000); apples, 10,325,000 bu. (\$6,711,000); sweet potatoes, 31,000 acres, 3,875,000 bu. (\$2,906,000); barley, 88,000 acres, 2,376,000 bu. (\$1,331,000); cotton, 31,000 acres, 25,000 bales (\$1,188,000).

**Mineral Production.** Virginia's production of its native minerals, as stated by the U.S. Bureau of Mines in 1940, totaled \$42,370,169 for 1938; to this, coal contributed the greater part. The production of bituminous coal rose to some 13,230,000 net tons for 1939, from 12,283,036 tons (value, \$24,054,000) for 1938; and heavier production in 1940 yielded 14,950,000 tons in 12 months. Stone, of which the output attained \$5,606,470 (1938) and \$5,879,447 (1939), averaged the producers not far from \$1 a ton; it contributed the second greatest part, in value, of the State's mineral total. Cement and zinc came next; their annual totals were not published separately as to Virginia. Clay products (exclusive of pottery and refractories) attained \$1,885,876 for 1938. Lime was produced (1938-39) to the value of about \$1,000,000 a year.

A small production of anthracite (109,642 tons for 1938) continued to form a minor feature of the State's mineral industry.

**Education.** For the academic year 1939-40, Virginia's inhabitants of school age (from 7 years to 19) were reckoned at 712,081. Enrollments of pupils in all public schools numbered 556,552; this comprised 434,479 in elementary study and 122,073 in high school. Teachers in public schools numbered (October, 1939) 17,734; the yearly pay of the teachers, principals, and supervisors averaged \$952. The enrollments of elementary pupils fell short, by nearly 23,000, of those for the academic year 1938-39, in accordance with a prevailing tendency among the States.

**History.** Shipyards at tidewater were busy on huge Federal orders. They got most of the advantage that the rearmament boom brought to the State. See PORTS AND HARBORS.

Virginia's ambition to increase its population's employment in manufacturing took more definite form. The University of Virginia, to serve this aim, created a bureau of industrial research. Under Robert H. West, former head of the Riverside and Dan River cotton mills, director of the new bureau, a scheme of policy was considered; its reported features were the planning of new industries, the effort to decentralize the development of manufacturing, and the encouragement of new locations of enterprises in areas having an available surplus of population above the number needed in existing employment. A study of the population of the State was under way, in connection with the industrial research; the Rockefeller General Education Board made grants for both purposes. A related study of the use made of the land proceeded under the Virginia Polytechnic Institute, aided by a similar grant. The State Planning Board co-ordinated the three studies. See INSURANCE.

U.S. Senator Harry F. Byrd, though noted as opposed to the course of the New Deal on frequent occasions, gained the Democratic renomination unopposed.

At the general election (November 5) the usual Democratic majority prevailed. The popular vote for President totaled 235,961 for Roosevelt (Dem.) and 109,363 for Willkie (Rep.). Harry F. Byrd was re-elected U.S. Senator, with only Socialist and Communist opposition. The nine incumbents were re-elected U.S. Representatives.

**Officers.** Virginia's chief officers, serving in 1940 were: Governor, James H. Price (Dem.); Lieutenant Governor, office left vacant by the death of Saxon W. Holt; Secretary of the Commonwealth, R. L. Jackson; Treasurer, Edwin B. Jones; Auditor, S. McCarthy Downs; Attorney General, Abram P. Staples; Superintendent of Public Instruction, Dr. Sidney B. Hall.

**VIRGIN ISLANDS.** An insular possession of the United States, situated about 60 miles to the east of Puerto Rico. This possession forms the southwestern part of a group which, as a whole, also bears the name, Virgin Islands, and of which the rest is a British possession. When needful for distinction, and commonly abroad, the U.S. possession is known as the Virgin Islands of the United States. This possession comprises three inhabited islands—St. Thomas, St. Croix, and St. John—and some 50 uninhabited islets. Total area, 132 square miles; population, 24,889 in 1940; 22,012 in 1930. Areas and populations (1930) of the individual islands: St. Thomas, 22 square miles, 9834 inhabitants; St. Croix, 84 square miles, 11,413 inhabitants; St. John, 20 square miles, 765 in-

habitants. Of the whole population, 78 per cent in 1930 were Negroes, 12 per cent of mixed race, and 9 per cent whites; 1939's birth rate 35.8, death rate 20.9, per 1000. Capital, Charlotte Amalie, on the island of St. Thomas.

**Production and Trade.** The main productive activity is the growing of sugar cane, chiefly on the island of St. Croix and the production of sugar and rum from the cane. Cattle are raised for domestic needs and for exportation to Puerto Rico. St. Thomas, an island too rugged for extensive agriculture, derives some of the support of its population from catering to tourists and from services to vessels that resort to the harbor of Charlotte Amalie for fuel, supplies, or repairs. After decades of economic decline the Virgin Islands became destitute in 1933. Federal grants of divers sorts, totaling \$8,347,000 approximately for the ten fiscal years 1931-40 or about \$340 to the inhabitant, have kept industry going and have otherwise assured part of the people's subsistence. Thus the Virgin Islands Co., a Federally owned corporation, in the years 1935-39, against an original Federal outlay, in capital, of \$3,409,404 and five years' gross receipts of \$824,914, had expenses, before tax-payments, of \$873,321 and a consequent deficit before taxes of \$48,407; deficit after taxes, \$139,926; but the company furnished

employment for a considerable part of the population.

In the fiscal year 1940, 985 ships, having a total tonnage of 3,844,289, entered port at the island of St. Thomas; 21 of these were carriers of tourists. Exports of cattle (fiscal year 1939) totaled 1944, in value \$49,306. For the calendar year 1940 the Virgin Islands' imports of merchandise from the United States amounted to \$3,023,979; exports thereto, of native products of the Islands, to \$1,448,020. Of the year's exports, rum furnished \$501,924; bitters, \$366,559. For 1939 exports of sugar to the United States totaled \$376,151. The imports, widespread in variety, covered most of the Islands' needs, including a considerable part of their animal and vegetable foods; main components were non-metallic minerals (nearly three-fourths being fuels), \$428,326; metal products, \$619,229; and (separate from the foregoing) machinery and vehicles, \$335,454.

**Government.** Under previous dispositions and an act of the U.S. Congress, the Organic Act of 1936, the Virgin Islands have as their chief executive a Governor, holding office by appointment of the President and, since 1939, acting under the supervision of the U.S. Department of the Interior. Justice is dealt by the U.S. District Court of the Virgin Islands and such subordinate courts as

TABLE 1—DEATHS (1939) AND DEATH RATES (1935-39) FROM SELECTED CAUSES UNITED STATES

	Total Deaths	Death rate (number per 100,000 estimated population)

hold power under the Islands' local laws. A Legislative Assembly has power to enact, subject to Federal approval, measures relating to the Islands as a whole. This Assembly consists of the combined membership of two Municipal Councils. The councils also each have considerable authority to make local laws for their respective municipalities. The two municipalities, that of St. Croix and that of St. Thomas and St. John, exercise home rule to a degree that greatly limits the Assembly's field. In each municipality the people elect the Council. The natives of the Islands are U.S. citizens, in general, though the phrasing of the grant of citizenship and of its later amendment failed to take in some natives no longer in the Islands. Governor in 1940, Lawrence W. Cramer.

As to finance, the chief Insular officers are paid by the United States. All taxes collected from inhabitants of the Islands, whether under Federal laws or under local laws, go into the treasuries of the respective municipalities. The revenue of the two municipalities and their expenditures, for the fiscal year 1940 were: St. Croix, \$176,013 in revenues and \$256,943 (or somewhat more) in expenditures; St. Thomas and St. John, similarly, \$232,849 and \$276,750. The yearly deficit of either municipality has recurred without exception throughout the period of U.S. possession. Yearly Federal appropriations cover each year's approximate deficits, as anticipated.

**History.** Efforts under way, to do away with the tax of \$6 a ton on exports of sugar from the Virgin Islands, made slight progress in 1940. The U.S. Congress had under consideration, as in two previous sessions, a bill to transfer to the Islands the Federal receipts in excise taxes collected on their products in the United States; supporters of this bill had in mind that such receipts would enable the Insular treasuries to give up the revenue from the sugar-export duty and would thus render the latter's repeal practicable. Governor Cramer in his annual report stressed the critical ills of the sugar-producing industry in the Islands and indicated the export tax as a difficulty that other exporters of sugar to the United States did not have to face.

A plan, reportedly urged by the Insular government, to harbor European refugees in the Islands came before the Department of the Interior late in the year. Governor Cramer resigned on November 26. Up to the end of 1940 the President named no successor.

**VITAL STATISTICS.** According to a report of the Bureau of the Census (Feb. 21, 1941), there were 2,265,588 births and 1,387,897 deaths reported for the United States for 1939, a decrease in the number of births and a slight increase in the number of deaths, as compared with the corresponding figures for the preceding year. The birth rate declined from 17.6 per 1000 estimated popula-

\* Per 1000 estimated population    <sup>b</sup> Under one year of age.    \* Per 1000 live births.    <sup>d</sup> Per 100,000 estimated population.

tion in 1938 to 17.3 in 1939, and the death rate decreased from 10.7 to 10.6 per 1000 estimated population. The death rate in 1939 was the lowest ever recorded for the United States death registration area.

The birth rate in 1939 was lowest in the Middle Atlantic States and highest in the Mountain States, the range being 14.8 to 21.4 birth per 1000 estimated population. The variation in the regional distribution of the death rates was not so great as that for the birth rates. The death rates ranged from 9.4 per 1000 estimated population for the West South Central States to 11.7 per 1000 estimated population for the New England States.

Although the death rates for such causes as heart diseases, cancers, and diabetes, reached new record highs, the favorable mortality experience relative to other causes of death was impressive. The death rates for influenza and pneumonia, for tuberculosis, and the infant and maternal mortality rates were, in 1939, the lowest ever reported for the United States death registration area.

See the accompanying tables, pages 798 and 799, for (1) deaths from selected causes in the United States in 1939, together with death rates for a five-year period, and (2) a report by States on total figures and rates for births, deaths, infant deaths, and motor-vehicle fatalities. Rates are based on estimated population figures. For actual population according to the 1940 census, see *POPULATION*. For trends in accidents, infant mortality, and maternal deaths, see *ACCIDENTS*; *BIRTH CONTROL*; *CHILDREN'S BUREAU*.

**WAGE AND HOUR DIVISION.** The Fair Labor Standards Act of 1938—better known as the Federal Wage-Hour Law—places a "floor" under wages and a "ceiling" over hours and prohibits "oppressive" child labor for employees engaged in interstate commerce or in the production of goods for interstate commerce. The administration and enforcement of the Act is vested in the Wage and Hour Division and the Children's Bureau of the U.S. Department of Labor (q.v.).

The wage "floor" was 25 cents an hour and the hours "ceiling," without payment of time and a half for overtime, was 44 a week from Oct. 24, 1938, the effective date of the Act, until Oct. 24, 1939. On that date the statutory minimum advanced to 30 cents and the statutory work week was lowered to 42 hours. On Oct. 24, 1940, the "ceiling" was reduced to 40 hours per week. There will be no further reduction in the maximum work week and no further change in the general minimum wage rate until Oct. 24, 1945, when 40 cents an hour will become the minimum. The Federal Wage-Hour Law does not prohibit overtime work beyond 40 hours a week—but it does require the payment of time and a half the regular wage rate for such overtime work.

Important developments under the Federal

Wage-Hour Law in 1940, in addition to the reduction of the hours maximum from 42 to 40 on October 24, included a re-definition of "area of production" and a re-definition of "executive, administrative, professional . . . outside salesman" by the Administrator of the Wage and Hour Division.

The re-definition of "area of production" under the new regulations exempts from the benefits of the Act only persons employed in establishments canning or packing fresh fruits and vegetables having not more than 10 employees, and whose commodities come from farms in the general vicinity. An additional seasonal exemption is also granted fresh fruit and vegetable packing and canning plants up to not exceeding 12 hours per day and 56 hours per week for 14 weeks.

The re-definition of "executive, administrative, professional . . . outside salesman," affecting almost all interstate commercial establishments, exempts certain "white-collar" employees who need not be paid overtime after 40 hours a week. The principal change was a separate definition for "administrative employee." An executive, as defined, remains one whose primary duty consists in management and who, among other qualifications, receives \$30 a week or more. Administrative employees are more broadly defined in the new regulations to include those whose duties, while important and associated with management, are functional rather than supervisory, and who are paid "a salary commensurate with the importance supposedly accorded the duties in question." The regulations require that such salary be not less than \$200 a month. A similar salary requirement was included in the definition of "professional."

It has been estimated that more than \$100,000,000 a year will be added to wage-earner's pay envelopes in 1941 by the 30-cent-an-hour minimum wage and by wage orders fixing minimum wage rates at more than 30 cents in certain industries. These wage orders provide for the establishment of minimum wages, industry by industry, at a rate higher than the statutory minimum, but not in excess of 40 cents an hour. The Administrator is empowered to issue wage orders upon the recommendation of industry committees to be appointed by him.

As of Jan. 1, 1941, 13 industrial wage orders had been issued, providing for an estimated increase in wages of \$35,000,000 to some 600,000 wage earners throughout the country. These wage orders applied to the following industries: Hosiery, cotton textiles, millinery, shoes, knitted underwear and commercial knitting, woolen textiles, hats, knitted outerwear, apparel, pulp and primary paper, leather, luggage and leather goods, and embroideries. In addition, a special industrial wage order was issued for the needlework industries in Puerto Rico in accordance with an amendment to the Act adopted by the Congress in June, 1940.

During 1940 provision was made for the employment of student-learners in vocational training programs at less than the statutory minimum rate. Under these regulations special certificates are issued authorizing the employment of student-learners at wage rates lower than those applicable under the Act, if such employment is in connection with a bona fide vocational training program. A "bona fide vocational training program" under these regulations means "a program providing for part-time employment of student-learners for a part of the working day, or for alternating weeks, or for limited periods during the year, such employment providing training which is supplemented by related instruction given the student-learner as a regular

part of his school course by the school, college, or university." The law provides for the employment of learners, messengers, apprentices, and mentally or physically handicapped workers at subminimum wages upon certification by the Administrator.

Improvements in procedure in 1940, together with an increase in the Division's personnel, resulted in more and swifter inspections, and "drives" for compliance in whole industries were initiated. The work was carried on in 14 regions throughout the country. Co-operative agreements were entered into by the Division and the Children's Bureau with the States of Connecticut and Minnesota and the District of Columbia. A co-operative agreement with North Carolina was renewed. These agreements, authorized by the Act, permit, on a basis of reimbursement, the use of State Labor department inspectional staffs in the work of enforcement. During the calendar year 1940, 1189 civil court cases were instituted, and 1098 injunctions were granted. A total of 72 criminal court cases were instituted during the year. The fines imposed totaled \$152,703.

Some important court decisions involving the constitutionality of the Act were rendered in 1940. The Darby Lumber Company, a Georgia lumber mill, attacked the constitutionality of the Act as an invasion of States' rights. A Federal District Court in Georgia upheld the contention. The United States, acting under the Criminal Appeals Act, took an appeal directly to the U.S. Supreme Court, which granted a review of the case. The Opp Cotton Mills of Alabama challenged the validity of the Administrator's Wage Order for the Textile Industry. The Administrator's Wage Order was upheld in the Fifth Circuit Court of Appeals and the U.S. Supreme Court granted a review of this case also. The appeals in both the Darby case and Opp case were argued Dec. 20, 1940.

The right of the Administrator to make routine inspections of employment records, regardless of whether or not a complaint has been filed, and despite the employer's contention that his workers were not covered by the Act, was attacked by Montgomery Ward and Company of Chicago. The company appealed from a decision of the Federal District Court upholding the Act and the Administrator's subpoena power. The Circuit Court of Appeals affirmed the decision, denying contentions of the company that the Act was not a valid exercise of the power of Congress to regulate commerce, and that the subpoena violated rights under the Constitution. The U.S. Supreme Court refused to grant a writ of certiorari in this case, thus upholding the right of the Administrator to inspect employment records.

During 1940, the Administrator issued 2650 certificates to handicapped workers, 2334 learner certificates, and found 27 industries or branches of industry to be of a seasonal nature and therefore entitled to the overtime exemption up to 12 hours a day or 56 a week for a period or periods totalling in the aggregate 14 weeks a year.

**WAR RELIEF ACTIVITIES IN THE UNITED STATES.** An article concerning war relief activities in 1940 in its broad outlines may be described by countries aided, by the general purposes of the organization, or divided by periods during which war conditions were controlling.

With the outbreak of World War II in September, 1939, a number of organizations sprang up in this country to give relief to Poland, to Great Britain, and to France. The attack on Finland the end of November, 1939, caused a general outpouring of sympathy and help, and in the spring of 1940 the invasion of Norway, Holland, Belgium, (the Grand Duchy of Luxemburg), and Greece started a new series of relief groups together with the intensification of aid by the organizations interested in Great Britain and France. With the exception of the Finnish relief groups, all relief organizations were controlled by the provisions of the Neutrality Act and had to comply with the regulations of the Department of State.

These regulations were issued under the general authority of a joint resolution of Congress approved on Nov. 4, 1939. Funds may not be solicited for the governments of States at war, as proclaimed by the President, but only for "medical aid and assistance, or for food and clothing to relieve human suffering" in accordance with rules laid down by the Department of State. Registration of all relief organizations is required, each organization must have an active governing body serving without compensation and a trustworthy treasurer, proper accounts must be kept and monthly reports submitted. The rules also forbid the use of solicitors on commission, the "remit or return" method for the sale of merchandise or tickets, the giving of entertainments where the estimated costs exceed 30 per cent of the gross proceeds, or "any other wasteful or unethical method of soliciting contributions."

The list of organizations on Dec. 31, 1940, included more than 300 different groups appealing to the American public and to persons especially interested in one country or another because of local ties. Those groups which had collected more than \$100,000 by that time are listed in the accompanying table, page 802.

Certain attempts were made during the year, particularly in May and June, to form some general council or agency to act as a clearinghouse for overseas relief appeals and to issue some joint appeal for relief. It was felt that any relief appeals for abroad should not prejudice domestic relief

## CONTRIBUTIONS FOR RELIEF IN BELLIGERENT COUNTRIES SEPT. 6, 1939-DEC. 31, 1940

(Department of State Bulletin, Feb. 1, 1941)

<i>Name of registrant, location, date of registration, and destination of contributions</i>	<i>Funds received</i>	<i>Funds spent for relief in countries named</i>	<i>Funds spent for administration, publicity, affairs, campaigns, etc.</i>	<i>Unexpended balance as of Dec. 31, 1940, including cost of goods purchased and still on hand</i>	<i>Estimated value of contributions in kind sent to countries named</i>	<i>Estimated value of contributions in kind now on hand</i>

campaigns and that local needs came first. Informal conversations were conducted by certain of these relief groups and this movement received the support of the Community Chest and Councils at their annual convention in May held in Detroit. Unified appeals had been made in the last war, and it was felt highly desirable that such joint appeals would not only lessen overhead expense but would simplify both collection and distribution problems.

At a time when local relief was needed in the United States the multiplicity of appeals for Europe tended to discourage and confuse the possible givers. Such attempts failed, however, due to inherent difficulties of organization and the inability of the American Red Cross, which was then conducting its own drive for twenty million dollars to aid civilians in war-torn Europe, to define the scope of its activities or to assume the leadership,

which all felt was rightfully its province. See CATHOLIC WELFARE CONFERENCE; ENGLAND, CHURCH OF; RED CROSS, AMERICAN NATIONAL; ETC.

Brief outlines of the accomplishments of certain of these organizations which carried on their principal work in 1940 follow:

**Poland.** Since the end of 1939 efforts have been made by various groups, including the Red Cross, the Commission for Polish Relief, the Quakers, and the Jewish Joint Distribution Committee to provide aid. It soon became apparent that relief was not possible in those parts of Poland annexed to Germany or occupied by Russia, so that the relief by necessity went to Central Poland—the so-called General Government of Poland—in addition to aid to Polish refugees in Rumania, Hungary, Greece, Lithuania, France, Portugal, and England. The actual distribution of foodstuffs in Poland was under the direct supervision of American Representatives of the Commission for Polish Relief through local Polish organizations. The German authorities granted free rail transport and warehousing. The Commission's total distribution to the end of December was nearly 1,000,000.

**Great Britain.** Some seventy separate agencies are providing civilian aid to Great Britain. The British War Relief Society, now merged with the Allied Relief Fund under the former's name, was successful in raising more than \$4,000,000. Its funds, sent partly in cash and principally in supplies, have been used to provide ambulances, mobile kitchens, hospital equipment, and civilian supplies of all kinds as well as direct transfers of cash. Originally set up to meet needs in France and England, the Allied Relief Fund has concentrated on help to Britain since the fall of France.

"Bundles for Britain" at first concentrated its effort on obtaining knitted articles, woolen goods, used clothing, medical supplies, for soldiers and civilians, recently concentrating on blankets and children's cots for use in air-raid shelters. In the year ending in February, 1941, more than \$1,600,000 had been received in cash donations from benefits and from contributions of clothing, surgical supplies, and other articles.

**France.** The numerous societies and groups organized to provide help to France were unable to carry on effective work after May. Most of these groups, such as the American Friends of France, found it difficult to obtain funds, or to send necessary supplies even to unoccupied France, after the Armistice in June. The Quakers (American Friends Service Committee) has been carrying on relief, particularly for children and women in refugee camps, in unoccupied France.

**Finland.** The Finnish Relief Fund, organized in early December of 1939, under the national chairmanship of Herbert Hoover, was most active in appealing for general civilian relief in Finland until the close of the Russo-Finnish war in March, and a grand total \$3,440,119 was received to July 31. The success of the Fund was initially due to the immediate response of American newspapers which threw open their facilities to receive and acknowledge contributions, to careful organization of divisions for special groups, notably the industrial division, the corporation employee groups, sports events, theater benefits, and entertainments, and to the American Scandinavian organizations. Funds collected in this country were cabled to the General Relief Committee, set up by the Finnish Government to administer civilian relief from abroad, and used locally. The Red Cross shipped considerable quantities of medical supplies which

were used for the Army and some efforts were made to provide military supplies by other groups. The General Relief Committee in Finland used its funds for financial first aid to the evacuees, who totalled about 600,000, for families of soldiers, and for medical care. Of a total of 295,000,000 Finnish marks received from world charity more than 167,000,000 marks came from the Hoover Committee.

**China.** Despite the closing of the Burma Road, and in the face of other obstacles interposed by the Japanese government, American aid continued to trickle into China throughout 1940. On several occasions, medicines, including rare vaccines, were flown direct to bombed and beleaguered areas. "Bowl of Rice" parties, auction sales, dances, dinners, art exhibitions, etc., were staged in money-raising campaigns. Toward the close of the year a China Emergency Relief Committee was formed under the leadership of Pearl S. Buck. This organization functioned as a part of the American Bureau for Medical Aid to China. The American Red Cross reported on November 18 that the value of supplies sent by that organization into China since the beginning of hostilities until Nov. 1, 1940, totalled \$303,068.

**Greece.** Soon after the invasion of Greece at the end of October, the Greek War Relief Association was organized, and under able leadership it has merged practically all pro-Greek efforts into a single agency. Within a month after organization, more than 650 local committees were formed throughout the United States and its possessions. A goal of \$10,000,000 was set by the Association for relief of the civilian population of Greece. In fewer than two and one-half months, the committee had cabled directly to Athens \$2,500,000 and raised a similar amount in gifts of food, clothing, medical, and surgical supplies. During this short period of time three ships were dispatched to Greece loaded with food, clothing, and badly needed medical supplies. Due to war conditions these ships required three months or more to reach Greece with their precious cargoes. Because of this fact the major portion of the money raised by the Association was cabled directly to Athens, where an administrative committee was able to buy needed supplies from surrounding countries. Funds were raised through the usual mediums employed by organizations of this type; dinners, balls, dances, benefit shows, collection boxes, and the sale of pins and ornaments.

A break-down of the funds raised during the first three months of the drive showed that approximately 90 per cent of the money came from 800,000 Greeks and persons of Greek descent living in the United States. This, it was explained, was because the drive was in its infancy and the general public had not been contacted for contributions. But the Association is now receiving generous help also from the Americans. The Association's national committee includes: Harold S. Vanderbilt, honorary national chairman; Mrs. Huntington Astor, honorary chairman women's committee; the Most Rev. Athenagoras, national chairman; Spyros P. Skouras, national president.

**Child Relief.** The United States Committee for the Care of European Children was organized as a central agency and a clearinghouse to provide refuge in America for children evacuated from European war zones. Functioning in June with branches in many cities, the Committee made plans to bring many thousands of children under sixteen years of age, largely from England. Chil-

dren who were known to their foster parents and children who were unknown were provided for by the plan which was set up in co-operation with the Children's Overseas Reception Board in England and with officials in this country. More than 200,000 children were registered by their parents in England to come to the United States and Canada. Difficulties of providing safe passage for the children across the Atlantic, as well as the inherent troubles of selection of children for refuge, caused the British Government to announce the suspension of the plan on October 3. About 5000 children had been evacuated, some 1000 came to the United States under the Committee's auspices, and some 3000 children came independently, sponsored by university groups, manufacturing companies, and individuals. The Committee curtailed its activities but maintained a small staff at the end of the year capable of undertaking the work in 1941 should conditions change.

The Children's Crusade for Children carried its carefully organized appeal in April to the school children of America to aid their fellow children overseas. Through tin-can collections in the school-rooms nearly \$140,000 was raised and has been distributed to organizations aiding children in nine countries abroad or to refugees from war-torn countries. See CHILDREN'S BUREAU

PERRIN C. GALPIN.

**WAR WOUNDS.** See MEDICINE AND SURGERY.

**WASHINGTON.** Area, 69,127 square miles, includes water, 2291 square miles (but not the State's waters in Gulf of Georgia and Strait of Juan de Fuca). Population (U. S. Census), April, 1940, 1,736,191; 1930, 1,563,396. Seattle (1940), 368,302; Spokane, 122,001; Tacoma, 109,408; Olympia, the capital, 13,254. The urban population (dwellers in places of 2500 or more) gained (1930-40) 37,430 and attained 921,969, the rural population, mounting by 135,365, to 814,222, cut in half the lead of the urban group.

**Agriculture.** Washington harvested, in 1940, 3,548,000 acres of the principal crops; wheat and tame hay took up five-sixths of this area. Wheat, on 1,978,000 acres, bore 41,808,000 bu. (\$25,921,000 in estimated value to the cultivator). Tame hay, 1,001,000 acres, made 1,864,000 tons (\$14,912,000); apples for market totaled 28,804,000 bu. (\$24,483,000); pears, 6,585,000 bu. (\$4,840,000); potatoes, 45,000 acres, grew 8,325,000 bu. (\$4,662,000); dry peas, 136,000 acres, 1,768,000 bu. (\$3,713,000); hops, 6000 acres, 11,700,000 lb. (\$3,276,000); oats, 222,000 acres, 8,658,000 bu. (\$3,030,000); barley, 135,000 acres, 3,915,000 bu. (\$1,683,000).

**Mineral Production.** Washington's yearly production of its native minerals, as estimated by the U. S. Bureau of Mines, totaled \$21,167,004 for 1938. Coal, the leading item, yielded 1,566,973 net tons, (value \$4,939,000) in 1938; the yearly quantity mined rose to some 1,690,000 tons for 1939; the approximate output for 1940 was 1,688,000 tons.

**Metal mines'** production of ores of gold, silver, copper, lead, and zinc rose, in value of recoverable metal, to \$7,193,391 for 1940, from \$6,739,467 for 1939 and \$5,510,440 for 1938. The yearly total of gold diminished to some 84,665 oz. (1940), from 90,420 (1939), and by value to \$2,963,275, from \$3,164,700. But the total of zinc increased to 23,942,000 lb. (1940), from 20,262,000 lb. (1939); by value, to \$1,556,230, from \$1,053,624. That of copper rose also, to 18,858,000 lb., from 17,996,000 lb., and to \$2,130,954, from \$1,871,584.

**Education.** Enrollments of pupils in all the ordinary public schools of Washington numbered 331,409 for the academic year 1939-40. The total comprised 225,429 in elementary study and 105,980 in high school. Apart from these figures, the system of evening schools reported 10,434 elementary and 31,665 secondary enrollments. The year's expenditure for public-school education totaled \$29,442,858. The teachers numbered 11,216 and averaged, in yearly pay, \$1641.20.

**History.** A strike of groups in the International Longshoremen's Union in September halted considerable shipping in Tacoma and some other Sound ports, one of the vessels loading lumber for an aeronautical base of the U. S. Army in Alaska was delayed.

Against the State law requiring a license for catching salmon in the Columbia River, certain tribes of Indians brought Federal suit on behalf of the specific right of salmon-fishing accorded them by the United States in a treaty of 1855. In a similar situation the neighboring State of Oregon had been brought by public opinion only shortly before to enact exemption, from its fishing-license requirements, of Indians with treaty rights. See also BRIDGES, for collapse of the Tacoma Narrows Bridge; DISTRICT OF COLUMBIA; LABOR LEGISLATION; PUBLIC BUILDINGS ADMINISTRATION, RECLAMATION, BUREAU OF

**Elections.** At the general election (November 5) the popular vote for President went to Roosevelt (Dem.), by a total of 462,145, against 322,123 for Willkie (Rep.). Mon C. Wallgren (Dem.) was elected U. S. Senator, and an all-Democratic delegation of six were elected U. S. Representatives. The Governorship went to Arthur B. Langlie (Rep.), opposed by former U. S. Senator C. C. Dill (Dem.), in a close vote.

**Officers.** Washington's chief officers, serving in 1940, were Governor, Clarence D. Martin (Dem.), Lieutenant Governor, Victor A. Meyers; Secretary of State, Belle Reeves; Auditor, Cliff Yelle; Treasurer, Phil H. Gallagher; Attorney General, G. W. Hamilton; Superintendent of Public Instruction, Stanley F. Atwood.

**WATER POWER.** See ELECTRIC LIGHT AND POWER, POWER PLANTS.

**WATER SUPPLY.** See AQUEDUCTS; GEOLOGICAL SURVEY; SOIL CONSERVATION SERVICE, TUNNELS.

**WATERWAYS, Inland.** The largest enterprise of this kind in the United States is the control of the Mississippi River, south from the Missouri River to the Gulf, for both safe navigation and protection from floods. Its purpose is to maintain a minimum depth and clear channel during low-water periods, and to prevent flood damage along the river. This, however, is a continuous job, under the direction of the U. S. Engineer Corps (q. v.), going on year by year in the building and reinforcement of levees and the dredging, clearing, and straightening of the navigable channel.

Canalization of the Upper Mississippi, from the mouth of the Missouri to Minneapolis, was completed March 13, with the putting into service of lock and dam No. 24, at Clarksville, Mo. This was the last of the series of 26 dams, with locks for barge traffic. The lift of the locks averages 12½ ft., with a maximum of 38.2 ft. at the Keokuk dam, and a minimum of 5.5 ft. at the Winona dam. The locks are 600 ft. long and 110 ft. wide, the standard dimensions for government inland waterways. Flow over the Clarksville dam is regulated by a row of 15 radial Taintor gates 80 ft. long,

along the crest. Navigation is the main purpose of this project, with flood protection and power development as secondary considerations. The Cape Cod Canal is being deepened to have 32 ft. of water, and is being widened from 500 ft. to 700 ft.

Improvement of the New York State Barge Canal, started in 1935, is approaching completion. This work provides for deepening the canal from the former 12-ft. depth to 14 ft., from the Hudson River to Oswego, on Lake Ontario. It provides also for widening at bends and other points, and for raising all bridges to give a minimum clearance or headroom of 20 ft. above maximum water level for navigation. About 25 bridges have been raised so far. The deepening will be completed probably by July, 1941, and the raising of bridges by 1943.

For the Illinois State Water Waterway connecting Lake Michigan (at Chicago) with the Mississippi, application was made to the courts in 1940 for permission to increase the present flow from Lake Michigan for both navigation and sanitary purposes. This flow was reduced to 1500 cu. ft. per second on Jan. 1, 1939, by court order, and owing to the present discharge of some sewage effluent from Chicago it is claimed to have resulted in unsanitary conditions along the Illinois River. Increased flow will not affect navigation, as the waterway has a navigable depth of 9 ft., with 14 ft. of water on the sills of the locks.

The project of the Tennessee Valley Authority (q.v.) includes the formation of a navigable channel 9 ft. deep in the Tennessee River, from the Ohio, at Paducah, Ky., to Knoxville, Tenn., 650 miles, with a rise of about 500 ft. from the normal level of the Ohio. The ten dams on this river will have locks 110 x 600 ft., with an average lift of 57 ft. The Kentucky Dam is the largest, situated 23 miles from the Ohio, and having a lift of 73 ft. in the lock.

A large waterway with minimum depth of 10 ft. of water from the Atlantic Ocean at Charleston, S.C., to Columbia, S.C., will be a part of the Santee-Cooper hydroelectric development project, now under construction. Two dams on the Santee and Cooper rivers will form storage reservoirs which will be connected by a channel or canal 7½ miles long, thus diverting the water of the Santee into the Cooper River. The Cooper River dam at Pinopolis, with the power house, will have a lock 60 x 184 ft., giving a lift of 75 ft. A second canal, 5 miles long, 300 ft. wide, and with 11 ft. of water, will connect the lower end of the lock with the Cooper River. Above the lock, barges will pass through the two reservoirs and up the Congaree River to Columbia, a distance of over 100 miles.

Another small coastal inland waterway is that across Florida, by canal from the Atlantic near Miami to Lake Okeechobee, and from that lake along the Caloosahatchie River to the Gulf, near Fort Myers. The minimum depth is 10 ft. of water. New locks, 50 x 250 ft., to accommodate modern barge traffic, replace old locks 30 x 150 ft. This waterway is distinct, of course, from the project for a ship canal across Florida.

The old but often revived Lake Erie and Ohio River Canal project has been reported adversely by the Interstate Commerce Commission, as being an unnecessary competitor of railways covering the route. Its traffic would be what it could take from the railways, which could not stand such a loss. Furthermore, these railways have ample line and terminal capacity to carry any traffic likely to develop.

The St. Lawrence seaway project, to enable

large steamers to pass between the Atlantic Ocean and the Great Lakes, was still under consideration. In December, 1940, the President Roosevelt ordered another study of the power aspect, although several such engineering studies have been made. Opposition was based on the limited use in relation to the enormous cost (\$550,000,000); on the fact that part of the length and some of the locks would be in Canada, and on the possible detrimental effect on the flow and levels of the Great Lakes.

Canalization of the San Juan River, in Nicaragua, to provide a shallow-draft waterway between the Atlantic Ocean and Lake Nicaragua, was advanced in 1940 by an agreement between the governments of Nicaragua and Costa Rica as to certain rights and responsibilities for both countries. These conditions will apply also to the possible future extension of the waterway from the lake to the Pacific Ocean, which would require heavier construction work. Surveys and river studies for a waterway with navigable depth of either 8 ft. or 12 ft. have been made under the direction of the Chief of Engineers, U.S. Army, at the request of the government of Nicaragua.

The Albert Canal, in Belgium, opened in 1939 as a navigable waterway and a line of defense against invasion, failed of its latter purpose against the German advance in 1940. This failure seems to have been due largely to the number of bridges crossing the canal and the neglect to destroy these bridges in time, although such destruction had been carefully planned. Important canal and river navigation developments have been reported from Russia and Germany. The Corinth Canal, in Greece, has been attacked by bombs, but apparently without suffering serious damage.

E. E. RUSSELL TRATMAN.

## WATER WORKS AND WATER PURIFICATION.

The Quabbin reservoir on Swift River, heading the additional water supply system for the Boston Metropolitan District, had filled to a depth of 85 ft. by December 1, storing 70 billion of its ultimate capacity of 415 billion gallons. When filled the maximum water depth will be 150 ft. and the area flooded 38.6 square miles. Aqueducts connecting with the trunk mains leading to the various municipalities of the district and a large part of the 18-mile pressure tunnel-aqueduct at the eastern end of the aqueduct system are in use. New York City had holed through 80 miles of the 85-mile Delaware River Aqueduct by the close of the year and lined 25 miles of it with concrete. Construction of the Merriman and Never-sink dams had been started. The 242-mile Colorado River aqueduct of the Metropolitan Water District of Southern California and the half dozen pumping and repumping stations which lift water 1616 ft. had delivered enough water to the Cajalico terminal reservoir (renamed Lake Mathews) to store 80 per cent of the initial capacity of 35 billion gallons. Delivery of water to Los Angeles and the other 12 cities of the district by March 1 was expected. The initial 100 million-gallon unit of a lime-zeolite water-softening plant was under construction. The ultimate capacity of the project is one billion gallons. (For details of these three great projects see earlier issues of the YEAR BOOK.)

For Baltimore the pressure aqueduct connecting Loch Raven reservoir with the filtration plant was nearly completed. Its inside diameter is 12 ft., its length nearly 7 miles, and its capacity 275 million gallons a day. It is lined with concrete, smoothly finished on the inside for two-thirds of its length

and inner lined the rest of the way with continuously-welded steel plates. It supplements an unlined tunnel completed in 1874. At Toledo work continued on the \$9,000,000 project to bring water from Lake Erie through nearly 10 miles of 72-in. steel pipe to an 80-million-gallon filtration plant. This will replace the supply from the Maumee River. Grand Rapids has introduced a supply from Lake Michigan, 30 miles distant, and built a filtration plant replacing its old supply from Grand River. Wichita, Kan., has sunk wells, built a 30-mile conduit and a new iron-removal and filtration plant. Included in the conduit is a 16-mile stretch of 48-in. cement-lined centrifugally-cast iron pipe, the largest of its kind. Water is delivered by the city to the Wichita Water Co. for distribution, displacing a somewhat similar supply of poorer quality. See PENNSYLVANIA.

Of Chicago's three immense water purification projects to treat a total of a billion gallons a day, one was well under way and layout plans for the other two were being made at the close of the year. At St. Paul, water softening was begun in January at the enlarged filtration plant. Atlantic City, N.J., is building a 20-million-gallon aeration and filtration plant to remove taste and odor from the portion of its supply drawn from surface sources. In Canada, Toronto completed a 100-million-gallon filtration plant to supplement two already in use but postponed putting it in operation. Moose Jaw, Sask., has a unique new system of supply. Water is collected in a gallery alongside the South Saskatchewan River, pumped to an open ditch 68 miles long which delivers water to a 50-acre tract of land from which the top soil was removed to uncover a deep stratum of sand. Into the sand thus saturated 192 well points have been sunk and connected with pipes leading to pumps. (See *American City*, July, 1940.)

Guarding public water supplies from damage by covert enemies and preparation for possible damage in case of war is receiving increased attention. Some pumping stations and filtration plants have been closed to visitors. Watchmen at dams and along aqueducts have been increased. Plans to meet various emergencies have been made. In Great Britain civil defense authorities have issued orders for disinfection of water supplies by chlorination, where not already practiced, in order to eliminate possible contamination by enemy or other sources.

**WESTERN AUSTRALIA.** A State of Australia. Area, 975,920 square miles; population

(Mar. 31, 1940), 466,686, exclusive of full-blood aboriginals. Vital statistics (1939): 9036 births, 4336 deaths, 4203 marriages. Capital, Perth, 224,800 inhabitants (1939) including the port of Fremantle and other suburbs. Other important cities (1938 populations): Subiaco, 18,340; Kalgoorlie, 10,650. Education (1938): 1011 schools and 71,646 students enrolled.

**Production.** Chief crops: wheat (40,860,000 bu. in 1939-40), oats, barley, hay, grapes, apples, and potatoes. Livestock (1938): 9,177,531 sheep, 767,680 cattle, 143,674 horses, 81,383 swine, 14,144 goats. Wool (as in the grease) output (1940): 78,000,000 lb. Chief dairy products (1938-39): 16,244,449 lb. of butter, 980,254 lb. of cheese, 4,242,083 lb. of bacon and ham. The gold output for 1939 was valued at £11,796,085. Manufacturing (1938-39): 2129 factories, 23,211 employees, £8,775,586 net value of production. There were 4378 route miles of State railway in 1938-39; 11,415,615 passengers and 3,605,912 tons of freight were carried.

**Government.** Finance (1939-40): revenue, £11,120,000; expenditure, £11,267,000; public debt, £96,230,000. The executive authority was vested in a governor, aided by an executive council of responsible ministers. Parliament consists of a legislative council of 30 members elected for a 6-year term, and a legislative assembly of 50 members elected for a 3-year term by universal adult suffrage. The standing of the various political parties at the election of Mar. 18, 1939, was: Labor 27, Country 12, Nationalist 9, and Independent 2. Governor (position vacant); Lieutenant Governor, Sir James Mitchell (appointed July, 1933); Premier, John Collings Willcock. See AUSTRALIA.

**WESTERN SAHARA.** See SPAIN under *Colonial Empire*.

**WESTERN SAMOA.** See under SAMOA.

**WEST INDIES NATIONAL COUNCIL.** See BRITISH WEST INDIES under *History*.

**WESTRICK CASE.** See FASCISM.

**WEST VIRGINIA.** Area, 24,170 square miles; includes water, 148 square miles. Population (U.S. Census), April, 1940, 1,901,974; 1930, 1,729,205. Charleston, the capital (1940), 67,914. The State's rural population increased (1930-40) by 129,981, to 1,367,682; the urban population (dwellers in places of 2500 or more) rose by 42,788, to 534,292.

**Agriculture.** West Virginia harvested, in 1940, 1,491,600 acres of the principal crops. Corn, on 476,000 acres, bore 12,852,000 bu. (\$10,282,000 in estimated value to the cultivator; tame hay, 726,000 acres, made 833,000 tons (\$8,746,000); potatoes, 33,000 acres, 3,630,000 bu. (\$3,013,000); apples for market totaled 4,868,000 bu. (\$3,408,000); wheat, 139,000 acres, 2,016,000 bu. (\$1,774,000). Farms numbered 99,282 in 1940 and averaged 89.7 acres.

**Mineral Production.** The value of native minerals produced by West Virginia in 1938, as estimated by the U.S. Bureau of Mines, came to \$254,995,309; of this sum coal contributed over seven-tenths and natural gas, over one-fifth. From 93,288,172 net tons (value, \$179,356,000) for 1938, the mines' output of coal advanced to 107,938,000 tons for 1939 and to some 126,302,000 tons for 12 months of 1940. Natural gas delivered to consumers totaled 134,342 million cu. ft. (value, \$55,910,000) for 1938. Though drilling for natural gas diminished in 1939, it brought a number of additions to the reserve of gas in the ground and some finds in fresh fields or formations. Gasoline was obtained from natural gas, to the quantity of 50,-

612,000 gal. in 1939, as against 50,398,000 gal. (value, \$2,063,000) in 1938. The production of Pennsylvania-grade petroleum diminished somewhat, to 3,444,000 bbl. (1940) from 3,580,000 bbl. (1939), and 3,684,000 bbl., value \$5,600,000 (1938).

**Education.** For the academic year 1939-40, West Virginia's inhabitants of school age (from 6 years to 20) were reckoned at 541,873. Enrollments of pupils in the public schools numbered 452,821: those in elementary study, 312,640; those in high schools, 140,181. The year's expenditure for public-school education totaled \$26,808,014. The teachers numbered 16,133; their salaries for the year averaged \$1169.40.

**History.** The manufacturing industries in the State gained heavily in business on account of orders created by the new Federal program of increased armament. The Government's great establishment for producing armor plate underwent reconditioning and enlargement with a view to its soon resuming production on a higher scale, after years of idleness. A contract between the Government and the Du Ponts called for the latter's building near Morgantown, at Federal expense, a \$15,000,000 establishment for producing ammonia, and for their operation of the undertaking.

A State Court order was granted in August, restraining the Secretary of State from including Communist candidates on the ballot. U.S. Senator Rush D. Holt was removed from the number of the Senate's Democratic opponents of the New Deal; at the primary elections (May 14) he failed of renomination, and Judge Harley M. Kilgore, a whole-hearted approver of the Federal Administration, was chosen in his place. See **COMMUNISM**.

At the general election (November 5) the voting ran consistently Democratic. The popular vote for President totaled 496,146 for Roosevelt (Dem.) and 372,662 for Willkie (Rep.). U.S. Senator M. M. Neely (Dem.) was elected Governor, defeating D. Boone Dawson (Rep.). For U.S. Senator, Harley M. Kilgore (Dem.) beat T. B. Sweeney (Rep.). Six Democrats were elected U.S. Representatives.

**Officers.** West Virginia's chief officers, serving in 1940, were: Governor, Homer A. Holt (Dem.); Secretary of State, William S. O'Brien; Treasurer, Richard E. Talbott; Auditor, Edgar B. Sims; Attorney General, Clarence W. Meadows; Commissioner of Agriculture, J. B. McLaughlin; Superintendent of Free Schools, W. W. Trent.

**WHEAT.** The wheat crop in the United States in 1940 was estimated by the U.S. Department of Agriculture at 816,698,000 bu., about 9 per cent larger than the 1939 crop of 751,435,000 bu. and substantially above the 1929-38 average of 754,685,000 bu. The total area harvested in 1940, 53,503,000, compared with 53,482,000 acres in 1939 and the 10-year average of 56,869,000 acres. Total acreages differed little but yield per acre averaged 15.3 bu. in 1940 and 14.1 in 1939. The acreages harvested, average acre yields, and total production, respectively, were for winter wheat 36,147,000 acres, 16.3 bu., 589,151,000 bu.; durum 3,121,000 acres, 11.1 bu., 34,776,000 bu.; and other spring wheat 14,235,000 acres, 13.5 bu., 192,771,000 bu. The States leading in winter wheat production included Kansas 123,648,000 bu., Oklahoma 56,332,000, Ohio 42,097,000, Illinois 39,555,000, Nebraska 33,696,000, Missouri 31,690,000, Indiana 30,030,000, and Texas 29,355,000 bu. Spring wheat production in leading States was in North Dakota 97,054,000 bu., Montana 36,950,000, Minnesota 28,061,000, South Dakota 25,121,000, and Washington 15,824,-

000 bu. The durum crop included 27,082,000 bu. harvested in North Dakota, 6,270,000 in South Dakota, and 1,424,000 bu. in Minnesota. The season average price per bu. (preliminary) received by farmers was 67 cents and the value of production was estimated at \$547,084,000 in 1940 compared to 69.1 cents and \$519,575,000 in 1939.

World wheat production in 1940 was estimated at 4,116,000,000 bu., substantially below the 4,268,796,000 grown in 1939; and world wheat supplies, excluding U.S.S.R. and China, for the year beginning July 1, 1940, were estimated in late December at about 5,536,000,000 bu. compared with 5,474,000,000 bu. in 1939-40.

**WINDSTORMS.** See **INSURANCE**.

**WINDWARD ISLANDS.** An insular group in the British West Indies comprising the colonies shown in the accompanying table.

<i>Colony (Capital)</i>	<i>Sq. mi.</i>	<i>Pop (1938)</i>
Dominica (Roseau) . . . . .	304	50,617*
Grenada (St. George's) . . . . .	133 <sup>b</sup>	89,415 <sup>b</sup>
St. Lucia (Castries) . . . . .	233	69,084
St. Vincent (Kingstown) . . . . .	150*	58,381*
Windward Islands . . . . .	820	267,497

\* The estimated population on Dec. 31, 1939, was 51,951. <sup>b</sup> Includes the islands of the southern Grenadines—Carriacou, etc (13 sq. mi.). \* Includes the islands—Bequia, Canouan, Mayreau, Mustique, and Union—of the northern Grenadines (17 sq. mi.).

St. George's, the capital, had 4629 inhabitants (1921 census); Roseau, 9000; Castries, 21,124; Kingstown, 4269.

**Production and Trade.** Chief products: arrowroot, cotton, sugar, molasses, rum, copra, cacao, peanuts, cassava, spices, limes, citrus fruits, and vegetables. St. Vincent is noted for its arrowroot and its sea-island cotton. Trade (1938): imports, £785,215; exports (excluding re-exports), £666,713.

**Government.** Finance (1938): revenue, £429,181; expenditure, £447,363; debt, £537,335. There is one governor for all the four colonies but there is no common legislature and each colony has its own executive and legislative councils. In view of the transfer of Dominica to the Windward Islands on Jan. 1, 1940, a conference was held in St. Lucia to determine the arrangements between the four governments. Governor and Commander-in-Chief, Sir Henry Popham (appointed Jan. 19, 1937). See **SR. LUCIA**; **BRITISH WEST INDIES** under *History*.

**WINE.** See **ALCOHOLIC BEVERAGES**.

**WIRE TAPPING.** See **COURTS** under *Admissibility*.

**WISCONSIN.** Area, 56,066 square miles; includes water, 810 square miles (but not the State's

part of the Great Lakes). Population (U.S. Census), April, 1940, 3,137,587; 1930, 2,939,006. Milwaukee (1940), 587,472; Madison, the capital, 67,447. The urban population—dwellers in places of 2500 or more—increased (1930-40), by 125,301, to 1,679,144; the rural population, by 73,280, to 1,458,443.

**Agriculture.** Wisconsin harvested, in 1940, about 10,166,000 acres of the principal crops. Corn, on 2,255,000 acres, bore 93,582,000 bu. (\$56,149,000 in estimated value to cultivator). Tame hay, 4,086,000 acres, made 7,416,000 tons (\$49,687,000); tonnage (and its estimated farm value) were the year's highest, for this crop, in the Union. Oats, 2,251,000 acres, produced 96,793,000 bu. (\$30,006,000); barley, 654,000 acres, 24,525,000 bu. (\$11,527,000); potatoes, 193,000 acres, 15,054,000 bu. (\$7,527,000); tobacco, 24,500 acres, 36,532,000 lb. (\$3,678,000); wheat, 86,000 acres, 1,743,000 bu. (\$1,307,000); rye, 193,000 acres, 2,509,000 bu. (\$1,079,000).

**Manufacturing.** The yearly value of Wisconsin's manufactured products totaled \$1,604,506,797 for 1939 (for 1937, \$1,772,310,417). Other related totals for 1939 (each with that for 1937 subjoined) follow. Establishments numbering 6718 (6318) paid to 200,897 (234,067) persons wages totaling \$251,947,973 (\$296,365,346); spent for materials, contract work, etc., \$917,868,435 (\$1,062,486,184); and added to materials, etc., by manufacture, \$686,638,362 (\$709,824,233).

**Mineral Production.** The value of native minerals produced in Wisconsin, as stated in 1940 by the U.S. Bureau of Mines, totaled \$10,636,741 for 1938. The shipments of iron ore from the two mines in Iron county rallied to 1,173,828 gross tons for 1939, from 625,378 for 1938; by value, to \$3,526,980, from \$1,886,477. The mines' actual production varied less, being 972,685 tons for 1939 and 854,795 for 1938. The mining of zinc, increasing in importance, produced in 1940 an estimated 5950 tons of recoverable zinc, having a value of some \$773,500. Production (1939) of stone, 3,182,780 tons, was valued at \$3,564,045, including about \$1,000,000 in granite and limestone sold in specified dimensions for building, etc.

**Education.** For the academic year 1938-39 (latest covered by the data that follow), Wisconsin's inhabitants of school age (from 4 years to 20, inclusive) were reckoned at 834,095. The enrollments in all public schools numbered 537,653: this comprised 382,245 in elementary study and 155,408 in high school. The year's expenditure for public-school education totaled \$53,688,670. The teachers numbered 21,600; their yearly salaries averaged \$1307.

**History.** The State administration, still troubled by high expenditure and a depleted general fund, both inherited from its predecessor, was aided by the better yield of the State's taxes on incomes, raised in some respects by the Legislature in 1939. A curtailment of work on improving highways and a considerable curtailment of personnel in departments that had been consolidated were effected for economy.

The moderation of liberalism among the voters appeared anew in Milwaukee's municipal election, which interrupted after 24 years the tenure of the city's Socialist Mayor, Daniel W. Hoan; Carl F. Zeidler was elected Mayor (April 2), defeating Hoan by a moderate margin. Zeidler had no Democratic or Republican affiliation; although he had a brother in the local Socialist organization, he made his campaign largely against Socialism. The voters

had no particular quarrel with Hoan, who had kept up the widely praised type of government established when he freed the city of corruption at the outset of his tenure; Hoan indeed made his disastrous campaign on a generally acknowledged record of honest and successful administration. Zeidler's victory was attributed to a winning personality and a well-organized following, plus a well-timed appeal to the revulsion against liberal theories.

A Research Bureau created by the Legislature in 1939 to seek out possible malfunctioning in the organs of the State government was active in 1940. One of its inquiries went into indications of irregularity in deals of the Department of Conservation, under the previous administration, to exchange public for private lands.

**Elections.** At the State's general election (November 5), victory was divided among the tickets of the Republican, Democratic, and Progressive parties. The popular vote for President went to Roosevelt (Dem.) by a total of 704,821, as against 679,206 for Willkie (Rep.). Julius P. Heil (Rep.) was re-elected Governor, defeating Orland S. Loomis (Progressive) and Francis E. McGovern (Rep.). Robert M. LaFollette (Progressive) won re-election to the U.S. Senate, against Fred H. Clausen (Rep.) and James E. Finnegan (Dem.). Republicans and Progressives shared up seats in the U.S. House of Representatives. The main successes of Democratic and Progressive candidates were ascribed to a friendly understanding between the two groups: the Progressives refrained from nominating a Presidential candidate and thus left the party's members free to vote for Roosevelt; LaFollette himself, who had attacked the Administration's course in foreign policy, declared continued support, as Senator, for Roosevelt's domestic policies; and Henry A. Wallace, Democratic nominee for Vice-President, expressed, in an address at Madison (October 22), such praise of LaFollette's Senatorial record as virtually to invite votes for the Senator in preference to Finnegan, the Democrats' own nominee. These moves, in combination, encouraged a Progressive vote for Roosevelt.

**Officers.** Wisconsin's chief officers, serving in 1940, were: Governor, Julius P. Heil (Rep.); Lieutenant Governor, Walter S. Goodland; Secretary of State, Fred R. Zimmerman; Treasurer, John M. Smith; Attorney General, John E. Martin; State Superintendent of Schools, John Callahan.

**WOMEN IN INDUSTRY.** See LABOR CONDITIONS; WOMEN'S BUREAU.

**WOMEN'S BUREAU.** The. A bureau in the U.S. Department of Labor authorized by law to "formulate standards and policies which shall promote the welfare of wage-earning women, improve their working conditions, increase their efficiency, and advance their opportunities for profitable employment."

The Women's Bureau in 1940 found its efforts once more concentrated on the needs of women in defense work. A labor advisory committee composed of representatives of international unions that have active women members in industries directly connected with the defense industries was established to assist the Bureau in determining the types of employment in the defense program for which women are best suited and the measures necessary for their welfare. Based on experiences in the war of 1914-18 and more recent developments, standards for the employment of women who must play so important a part in the manu-

facture of war materials were drafted and made public in a pamphlet entitled *Effective Industrial Use of Women in the Defense Program*. In addition, the Bureau made a preliminary survey of about 40 plants filling defense contracts, and on the basis of this investigation made recommendations as to the types of work for which women are best fitted and the technical and vocational training they require. Next a joint conference of the Bureau's advisory committees was held to consider possibilities and plans for training women workers in connection with the defense program. Since discussion disclosed that almost no women were involved in either the vocational training courses or within-industry training system, developed to meet defense needs, the conference urged that suitable numbers of women be included in such programs, since skills in which women can excel will be in demand.

Though of first importance, defense activities have not entirely overshadowed the other services the Bureau performs for wage-earning women. This year additions have been made to its already extensive files on the gainful employment of women: Their occupations; their health and welfare; their wages, hours, and working conditions; the trends of their employment and earnings; their income, cost of living, and responsibilities; their economic and legal status; the census and other data concerning them; legislation in their behalf; and the efforts of Federal, State, and private groups to improve their conditions. Assistance has been given to State and local authorities in improving procedures, enforcement methods, and statutory provisions of various labor legislative programs.

In response to requests, thousands of copies of charts, maps, written materials of all sorts, and various exhibits and films, illustrating and explaining the problems of women in industry have been sent to schools, trade unions and other organizations, and to inquiring individuals, in the United States and abroad.

Of special interest are the various bulletins (including the one mentioned above) issued in 1940. The following deal with employment in special fields and particular communities: *Application of Labor Legislation to the Fruit and Vegetable Canning and Preserving Industries*—comprising a thorough study of earnings, hours, trends of employment, and labor costs; *Earnings in the Women's and Children's Apparel Industry in the Spring of 1939*—a comprehensive analysis of pay-roll data of more than 135,000 workers in this industry; *Hours and Earnings in Certain Men's-Wear Industries, Part 5—Raincoats and Sport Jackets, and Part 6—Caps and Cloth Hats, Neckwear, Work and Knit Gloves, Handkerchiefs; Wages and Hours in Drugs and Medicines and in Certain Toilet Preparations; Earnings and Hours in Hawaii Woman-Employing Industries; Employment in Service and Trade Industries in Maine; Women's Wages and Hours in Nebraska*. Two additional reports deal with legal questions: *Major Legal Distinctions Between Sexes*—condensed from bulletins for every State on the legal status of women; *State Minimum-Wage Laws and Orders: 1939*—this supplements material already available in this field and presents a ready reference manual as of December, 1939.

Certain important facts concerning women's employment in the United States were published this year in Spanish and in Portuguese as a pamphlet entitled *The Woman Worker in the United States*, for distribution in the Latin-American countries.

*The Woman Worker*, the Bureau's bi-monthly publication, which keeps its readers informed as to current developments in the employment of women, was widely circulated.

MARY ANDERSON.

**WOOL.** The strong mill demand for wool and the upward trend in prices at the close of 1940 was in sharp contrast to the relatively weak demand and declining prices during the first quarter of the year. Consumption of apparel wool for the first half of 1940 was 16 per cent below the 1939 level. Stimulated by large Army orders plus increased demand of woollen goods for civilian use, monthly mill consumption increased sharply after July and reached record proportions during November and December. Total consumption for the year was about 2 per cent above the 1939 level of 630 million lb. The price, on the Boston market, for territory fine staple wool, scoured basis, averaged 108.5 cents per lb. during November and December and 96.3 cents for 1940, as compared with 82.7 cents for 1939 and 70.4 cents for 1938. Other grades followed similar price trends. Army contracts for cloth and blankets let during the last half of the year, covering requirements to June 30, 1941, called for approximately 200,000,000 lb. of unscoured wool, chiefly of the fine domestic grades. Heavy unfilled orders were carried into the new year.

The 1940 wool clip in the United States was estimated to total 387,763,000 lb., the largest on record. This is 3 per cent above the shorn wool production of 1939 and 7 per cent above the preceding 10 year average. The total domestic production was augmented by about 62 million lb. of pulled wool. The average price received by farmers for grease wool in December was 31.2 cents per lb. as compared with 27.5 cents in December, 1939, and averages of 19.2, 22.3, and 28.4 cents during 1938, 1939, 1940, respectively.

Imports of apparel wool into the United States during 1940 totaled 222,983,000 lb. as compared with 98,193,000 lb. in 1939. Imports of carpet wool were 134,691,000 lb. in 1940 and 144,875,000 lb. in 1939.

World production of wool during 1939-40, exclusive of the Soviet Union and China, totaled 3670 million lb., of which 2202 million lb. were produced in the five major exporting countries of the Southern Hemisphere, Australia, New Zealand, South Africa, Argentina, and Uruguay. Preliminary estimates place the 1940-41 wool clip of these countries at 2104 million lb., or about 4 per cent below that of the preceding season, with Australia accounting for most of the decrease.

The British Government, following the action of 1939 in contracting for the entire wool production of Australia and New Zealand for the duration of the war, took over the South African clip in 1940 so that about 85 per cent of all Southern Hemisphere wool is now subject to the British Wool Control. Reasonable quantities from these sources were released to fill United States orders during the year. In addition, an agreement between the British and United States Governments, consummated Dec. 9, 1940, provided for the storage-in-bond of 250 million lb. of British-owned, Australian wool in the United States, to be used by this country whenever the U.S. Government decides that an emergency wool shortage exists. Heavier-than-normal exports of new wool moved out of Argentina and Uruguay during the last quarter of 1940, 87 per cent went to the United States. In contrast, only 49 per cent of the 1939-

40 wool exports and 18 per cent of the 1938-39 exports from Argentina, and even smaller percentages from Uruguay, came to this country. See CUSTOMS, BUREAU OF; FEDERAL TRADE COMMISSION; GARMENT INDUSTRY; TEXTILES.

E. C. ELTING.

**WORKMEN'S COMPENSATION.** See LABOR LEGISLATION; ARKANSAS under *History*; INSURANCE under *Casualty Insurance*.

**WORK PROJECTS ADMINISTRATION (WPA).** That part of the Federal Works Agency which conducts a program of useful public work, in co-operation with State and local governments, in order to provide work and wages for the needy able-bodied unemployed.

The outstanding development in the WPA program during 1940 was the provision made for more extensive use of its organization and personnel in strengthening the defenses of the nation. Legislation passed by Congress facilitated the co-operation of the WPA in the defense program and at the same time provided for continuance of its operation of the principal program supplying jobs for the unemployed.

The number of unemployed people in the United States, after jumping from 9,200,000 in December, 1939, to a peak of 10,700,000 in January, 1940 (estimate of American Federation of Labor), dropped gradually during the rest of the year under the influence of improving business conditions. Following the same trend, WPA employment rose from an average of 2,100,000 in December, 1939, to 2,300,000 in February and March, 1940, and then followed unemployment downward. By the end of the year, unemployment had dropped to 7,900,000 and WPA employment totaled 1,900,000. WPA employment includes a relatively small number of workers, averaging 65,000 throughout the year, employed on WPA projects operated by other Federal agencies with funds allocated to them by the WPA.

During the year, the WPA spent \$1,388,293,000 of Federal funds—of which 3.7 per cent was devoted to administrative costs and 96.3 per cent to project work. Of the \$1,337,471,000 devoted to project work, 92 per cent was paid out in wages to workers. These project funds were supplemented by project sponsors' funds aggregating \$532,207,000, most of which was used for other than labor costs—for materials, equipment, etc. The sponsors' share of the total cost of WPA project work was 28.5 per cent. During the four and one-half preceding years of its existence, the WPA had spent in all some \$7,385,073,000 of Federal funds—4 per cent of it on administration and 96 per cent on project work. To supplement the approximately \$7,073,893,000 of WPA project funds, local sponsors had contributed some \$1,547,614,000, or 18 per cent of the total amount spent on project work. In addition, other Federal agencies spent the following amounts of WPA funds allocated to them for the operation of WPA projects under their direct supervision: some \$51,795,000 in 1940, and a total of \$154,060,000 since July, 1938, when the policy of allocating WPA funds to other agencies for operation of projects was initiated.

The primary function of the WPA during 1940, as during preceding years, was to provide work and wages for the unemployed. Experience had shown that work was better for the unemployed than direct relief, because it preserved their skills and morale; better also for the country as a whole, because it built up public facilities and provided

many needed services at the same time that it contributed to recovery by increasing purchasing power.

Certain characteristics which the WPA had acquired in the course of its development remained essentially unchanged during 1940. Its projects were adjusted to the skills of the people whom it employed, and were carried on in the communities where they lived. Its projects conformed also with the needs and desires of the communities themselves—this being assured through local sponsorship of the projects. (Some projects, however, were sponsored by Federal agencies, such as the War and Navy Departments.) Local relief agencies certified the need of workers for WPA employment, while actual assignment of workers to projects was left to the WPA. About 96 per cent of those employed were taken from local relief rolls. Wages varied with the section of the country and with the size of the community in which the worker lived as well as with his skill; the average monthly wage being about \$56.

The kinds of work undertaken during 1940 were much the same as in previous years, except for the greater emphasis on activities that fit into the national defense plans. About three-fourths of the WPA program (on the basis of employment as well as of expenditures) was devoted during 1940, as during preceding years, to construction work. More than two-fifths of all WPA workers were on road projects—a slightly larger proportion than in earlier years. (While most of this work was on farm-to-market roads, an increasing share was done on strategic highways and on roads giving access to airports, military reservations, and training centers.) About a tenth each were employed on public buildings and public utilities; parks, white-collar work, and sewing projects also provided jobs for large numbers of workers.

No statistics showing physical accomplishments during 1940 are yet available, but the amount of work done was proportional to that accomplished during the first five years of WPA operation. Some idea of the extent and diversity of the program may also be derived from the following statistics for projects completed during the five-year period that ended on June 30, 1940.

More than 517,000 miles of roads, mostly in rural areas, and more than 104,000 bridges were built or improved. More than 96,000 public buildings were newly built, remodeled, renovated, or erected as additions to existing structures. Over 14,000 miles of water lines and over 21,000 miles of sewer lines were newly laid or reconditioned. Over 7200 parks, over 4800 athletic fields, over 11,000 playgrounds, and about 600 landing fields for aircraft were built or improved.

The amount of non-construction work done was also considerable. By Sept. 30, 1940, some 369,000,000 garments and household articles had been made in WPA sewing rooms for distribution among needy families, and 504,600,000 lunches had been served to undernourished school children. Millions of needy adults and children had received aid from WPA medical clinics and nursing service. Some 1,000,000 people were enrolled in 100,000 WPA educational classes. About 116,000 drawings, paintings, murals, and sculptured works had been produced by art workers; music performances (numbering about 4700 in June, 1940) had attracted monthly attendance of around 4,000,000; and writers, chiefly occupied in producing a series of guide-books, had completed nearly 700 books and pamphlets.

Much of the work done was related to national defense. Besides the airports, about 11,500 of the buildings built or improved by the end of June serve a defense purpose, as do also 1500 other buildings on which work was completed some time during the three months from July through September, 1940. Among the total of 13,000 buildings were nearly 5000 new or remodeled barracks and officers' quarters, some 900 mess halls and kitchens, about 600 armories (chiefly for the National Guard), about 2000 storage buildings, and many hospitals, infirmaries, garages, and buildings of other types. WPA defense work has also included many other improvements at military and naval reservations, such as the installation of sewers, water mains, and telephone, telegraph and electric power lines, road building, construction of gun ranges and maneuver grounds, and other activities, some of which were conducted on a camp-wide basis.

Concentration on defense work during the latter half of 1940 was encouraged by legislative provisions which made it possible to exempt certified defense projects (i.e. projects certified by the Secretary of War or the Secretary of the Navy as important for military or naval purposes) from many of the restrictions that usually apply to WPA projects. For example, certified defense projects may be exempted from the limitation on WPA expenditures for non-labor purposes to a State average of \$6 per man per month, and the WPA may spend as much as \$25,000,000 to supplement its usual non-labor expenditures. Certified defense projects may also be exempted from the requirement that Federal expenditures for any public building in the construction of which the WPA participates must not exceed \$100,000, as well as from the requirement that sponsors must pay 25 per cent of the total cost of projects approved after Jan. 1, 1940, in any State. Finally, they may be exempted from the usual regulations concerning hours of work and wages of workers.

In addition, the WPA was authorized to undertake projects for the training of workers for nursing and for manual occupations in industries engaged in production for national defense purposes. A nation-wide vocational training project, sponsored by the Advisory Commission to the Council of National Defense and co-sponsored by the United States Office of Education, was initiated in July, and by the end of the year had enrolled a cumulative total of 58,000 WPA workers.

Recent legislation differs slightly in some other respects from the previous act governing the operation of the WPA program. The Emergency Relief Appropriation Act for fiscal 1940-41 raised to \$100,000 the limitation on the amount of Federal funds that may be used for any public building in the construction of which the WPA participates. (The previous act restricted expenditures to \$50,000 and \$52,000, respectively, for Federal and non-Federal buildings.) The recent act extended to wives of unemployable veterans and to veterans' widows who had not subsequently remarried, two provisions that previously applied only to veterans—preference in project employment and exemption from the requirement that all relief workers who have been continuously employed on WPA projects for 18 months must be dismissed. It also extended the previous act's prohibition of the employment of aliens to apply to members of any Nazi bund organization, to Communists, and to any persons who advocate, or belong to an organization which advocates, the overthrow of the United States Government. See COMMUNISM;

MUSIC; RELIEF; UNITED STATES under *Investigations*.

HOWARD O. HUNTER.

**WORLD COURT.** The functioning of the Permanent Court of International Justice was interrupted by the German occupation of The Hague, seat of the Court. A session was held from February 19 to 26, but a further session scheduled for May was adjourned because of the intervening occupation. The officials of the Court remained at The Hague till July 16, when the occupying authorities cancelled their diplomatic status and they sought hospitality in Switzerland, ready to function when called.

The Court's membership remained unchanged, except for the death of Count Rostworoski in Poland on March 24. No step was taken in regard to the general election of judges postponed in 1939, the present judges continuing as provided in the Statute, with Mr. Guerrero of Salvador as President, Sir Cecil J. B. Hurst of Great Britain as Vice-President, Mr. Lopez Olivan of Spain as Registrar, and Mr. Manley O. Hudson as the judge of American nationality.

The Court's jurisdiction was somewhat modified in 1940. Greece ratified and Thailand renewed for ten years its acceptance of the Court's compulsory jurisdiction, while Great Britain on February 28, paralleled shortly by India, New Zealand, South Africa, and Australia, made a new declaration accepting that jurisdiction for five years, except for disputes arising during hostilities.

ARTHUR SWEETSER.

**WORLD SERIES.** See BASEBALL.

**WPA.** See WORKS PROJECTS ADMINISTRATION.

**WÜRTEMBERG.** See GERMANY under *Area and Population*.

**WYOMING.** Area, 97,914 square miles; includes water, 366 square miles. Population (U.S. Census), April, 1940, 250,742; 1930, 225,565. Cheyenne, the capital: (1940) 22,474. All the State's gain (1930-40) in population, except an increase of 1697 in the rural group, occurred in the urban population—dwellers in places of 2500 or more; the urban population, by a rise of 23,480, attained 93,577, or 37.3 per cent of all the inhabitants.

**Agriculture.** Wyoming harvested, in 1940, about 1,868,000 acres of the principal crops. Tame hay, on 746,000 acres, bore 927,000 tons (\$7,416,000 in estimated value to the farmer); sugar beets, 47,000 acres, made 634,000 tons (the smaller crop of the previous year, 1939, was estimated at \$2,533,000); wheat, 300,000 acres, 3,410,000 bu. (estimated at \$2,012,000); dry beans, 55,000 acres, 605,000 100-lb. bags (\$1,237,000); potatoes, 20,000 acres, 2,400,000 bu. (\$1,416,000); corn, 193,000 acres, 1,930,000 bu. (\$1,235,000); oats, 110,000 acres, 2,915,000 bu. (\$1,049,000); barley, 75,000 acres, 1,838,000 bu. (\$882,000).

**Mineral Production.** Wyoming produced \$37,364,363, in value, of its native minerals in 1938; the chief components, petroleum, coal, and natural gas, furnished within \$5,000,000 of the whole. From 19,022,000 bbl., value \$18,000,000 (1938), the yearly yield of petroleum increased to 21,417,000 for 1939 and to 25,683,000 for 12 months of 1940. The addition to yield in 1939 resulted mainly from success in deeper drilling and lateral extension in the Lance Creek field, which displaced the 20-year-old Salt Creek field as the chief producer. Natural gas delivered to consumers attained, for 1938, 26,678 million cu. ft., in value at points of

consumption, \$4,853,000. The gasoline extracted from natural gas in 1938 totaled 30,024,000 gal. (value, \$1,634,000). The coal mines' output, 5,203,877 net tons, \$9,851,000 in value, for 1938, totaled 5,383,000 tons (1939) and 5,748,000 tons (1940).

**Education.** For the academic year 1939-40, Wyoming's inhabitants of school age (from 6 years to 21) were reckoned at 72,283. The year's enrollments of pupils in public schools numbered 56,220. This comprised 39,761 in elementary study, 15,931 in high school, and 528 otherwise classified. The year's expenditure for public-school education totaled \$6,025,333. The teachers numbered 2720; the average yearly pay, according to teachers' groups, ran from \$1350 in high schools to \$650 in the rural schools.

**History.** Strife over the tendencies and merits of some of the teaching staff at the University of Wyoming brought on a situation somewhat similar to that in Montana (q.v.). Governor Smith of Wyoming called upon the trustees of the University not to renew the contracts of eleven of its teaching body. One of the number, Dean Arnold of the law school, was a brother of the Federal Attorney General; another, Prof. Arthur Himbert of the Law School, had served as special assistant to the Federal committee investigating monopolies. The impression went out that some at least of the eleven incurred disapproval by reason of their social-political ideas. The Episcopal diocesan Bishop, W. H. Zeigler, took the part of the eleven in a published protest (April 6) accusing the Governor, in turn, of seeking to fill the University's faculty with "political tools." The trustees renewed (April 8) the contracts of all the eleven.

At the general election (November 5) the popular vote for President totaled 59,287 for Roosevelt (Dem.) and 52,633 for Willkie (Rep.). U.S. Senator Joseph C. O'Mahoney (Dem.) was re-elected by 65,022 votes, defeating Milward Simpson (Rep.), who received 45,682. No election of major State officers fell due. See COLORADO.

**Officers.** Wyoming's chief officers, serving in 1940, were: Governor, Nels H. Smith (Rep.); Secretary of State, Lester C. Hunt; Treasurer, Mart T. Christensen; Auditor, William Jack; Attorney General, Ewing T. Kerr; Superintendent of Public Instruction, Esther L. Anderson.

**X-RAYS.** See CHEMISTRY; CHEMISTRY, INDUSTRIAL; ELECTRICAL INDUSTRIES; PHOTOGRAPHY.

**YACHTING.** With international competition among the larger craft cancelled because of war conditions, American yachting during 1940 experienced a comparatively quiet season. Even the much-advertised Cruising Club's Bermuda race was called off because of a more important contest involving British and German boats in those environs. A 455-mile substitute for the Bermuda classic was staged off Block Island and in adjacent Massachusetts and Maine waters. The winner of the event was Henry C. Taylor's well-known yawl *Baruna*, champion of the 1938 Bermuda pageant and one of the finest ocean yachts afloat. Through choppy seas and heavy fog it proved itself the leader of the pack, outdistancing another famous racing craft, James Grove's *Blitzen*.

Another distinguished competition of the year, the King's Cup Race, was won by Harold S. Vanderbilt's *Vim*, which snatched the late King George V's coveted prize away from F. T. Bedford's *Nyala*. The Vanderbilt yacht also wrested the cherished Astor Cup from *Nyala* in one of the most spectacular regattas of the season.

The second longest race in 1940 was the Stamford Yacht Club's 232-mile sail around Vineyard Lightship and return. It was led by Rudolph C. Lowenstein's little ketch *Soerabaja*. Frank C. Paine's sloop *Gypsy* took first honors in the Eastern Club's annual frolic from New London to Marblehead. *Viking*, Kenneth Millett's miniature sloop, appropriated the Myrick Trophy in the New Rochelle Club's 130-mile waltz around Cornfield Lightship. The annual dash of yachts across the Gulf Stream from Miami to Nassau was won by William H. Labrot's yawl *Stormy Weather*, for the fourth consecutive year. The 11th annual St. Petersburg-Havana race was captured by Robert W. Johnson's yawl *Good News*, a newcomer to the pastime. In Star Class racing, the world championship was taken from Germany by James and Gordon Cowie of Los Angeles, Calif., with their vessel *Rambunctious II* in maneuvers off San Diego, Calif.

**YANAON.** See FRENCH INDIA.

**YAP ISLAND.** See JAPANESE PACIFIC ISLANDS.

**YEMEN.** See under ARABIA.

**YOUTH MOVEMENT.** While there is no militant and regimented nationwide youth movement in the United States, there is a growing nexus of thought compounded of eagerness on the part of young people to foster and defend democracy, good will toward youth on the part of the adult population, and a pervasive recognition that the nation's human resources can be conserved and strengthened by continued improvement in the facilities for the education, employment, health, recreation, and general welfare of children and youth.

Progress during the year 1940 may be noted by observing advances in the programs of governmental agencies concerned with youth, and developments among the principal non-governmental youth-serving organizations. The principal agencies of the national government dealing directly with youth are the Civilian Conservation Corps (q.v.), and the National Youth Administration (q.v.). Among other national governmental agencies concerned in part with various aspects of the care and education of youth are: Education, U.S. Office of (q.v.), Public Health Service (q.v.), Children's Bureau, U.S. (q.v.), and the Employment Service Division of the Bureau of Employment Security in the Social Security Board. The Extension Service of the Department of Agriculture works in co-operation with State and local agencies, and conducts varied activities affecting many rural young people.

After the course of international events led to the inauguration of the comprehensive national defense program in the summer of 1940, the Congress appropriated an aggregate of about \$75,000,000 for the speedy training of technicians and other workers for defense industries. With the stimulation and guidance of the U.S. Office of Education, summer courses of technical training were immediately instituted in many local public school systems, and with the coming of the academic year 1940-41 this program was continued and expanded. The problem of co-ordinating all current efforts to train the skilled workers whom it is anticipated will be needed in the national defense program is the responsibility of the Division of Labor Supply, under the Labor Commissioner in the 7-member National Advisory Commission to the Council of National Defense.

The national policy of compulsory military training under a system of selective service was adopted

in the late summer of 1940, and subsequently October 16 was designated as the day on which 16,500,000 men aged 21 to 35 were registered for possible military service. It is expected that by July 1, 1941, 800,000 young men will have been selected by local draft boards and placed in military training camps for a period of one year. The program of peace-time military training will not only contribute to immediate military preparedness, but will also add much to the physical stamina and general efficiency of many of the nation's young men. It may well be, in the words of Dr. Clarence A. Dykstra, Director of Selective Service, that the experience will "not take a year out of a young man's life, but put a year into his life." The young men of the nation have, with the rarest exceptions, responded with good will and enthusiasm to the unprecedented policy of peace-time compulsory military service.

Among the larger non-governmental associations touching the lives of many young people are the Young Men's Christian Associations, the Young Women's Christian Associations, the 4-H Clubs for rural boys and girls, the Boy Scouts of America, the Girl Scouts, and the Camp Fire Girls. There are many other active youth-membership organizations. A recent survey, published in book form by the American Youth Commission in February, 1941, identified a total of 80 such national associations, as well as 250 national voluntary societies of adults, a substantial part of whose activities are devoted to the welfare of youth. Among these a place of importance is held by the religious societies for young people. See SOCIETIES AND ASSOCIATIONS

A conspicuous effort to mobilize the opinion of American youth is the American Youth Congress, in existence since 1934. It is composed of delegates from a large variety of loosely affiliated national and local societies of young people, and in 1940 claimed an aggregate underlying membership of 4,697,915. It held a "National Youth Citizenship Institute" in Washington, D.C., February 9-12, which received widespread notice in the press. Its sixth annual meeting at Williams Bay, Wisconsin, July 3-7 was marked by a factional dispute which took the form of refusal to seat a small group of dissenters who allegedly lacked proper credentials as delegates, whereupon this group withdrew and formed a rival agency known as the National Foundation for American Youth, under the sponsorship of Gene Tunney, former heavyweight boxing champion. An earlier schism had occurred in 1939, when a group representing a small number of Socialist, labor, and Jewish organizations, principally in New York City, instituted the agency known as the Campaign for Youth Needs.

A non-governmental agency engaged in large-scale research regarding the welfare of youth is the American Youth Commission, a body of fifteen nationally prominent persons set up in 1935 by the American Council on Education, and originally financed for a five-year period by the General Education Board. This period was subsequently extended to July 1, 1941. Newton D. Baker was chairman of the Commission until his death in 1937, and it is now headed by Owen D. Young. During 1940 the Commission continued its program of research and publication, issuing a notable series of five books reporting a comprehensive study of Negro youth in several selected localities. It also published during the year the report of a co-operative project with the U.S. Employment Service in which the co-ordination of local agen-

cies for the guidance and placement of youth was promoted in several localities, entitled *Matching Youth and Jobs*; and the fruits of several years' study of the situation and prospects of young people in rural America, entitled *Guideposts for Rural Youth*. A pamphlet entitled *The Community and Its Young People* was also issued.

The comprehensive investigation of the Civilian Conservation Corps for the American Youth Commission was continued and broadened to embrace a study of the National Youth Administration resident centers. New projects of the Commission include one in which stimulation and in some cases limited financial aid will be given to meritorious local efforts in behalf of rural youth in several selected communities in four States. During the year the Commission held three deliberative meetings and adopted concise recommendations which were issued and widely distributed in the form of leaflets entitled respectively *Occupational Adjustment for Youth*, *Community Responsibility for Youth*, *Shall Youth Organize?*, *Youth, Defense, and the National Welfare*, and *The Civilian Conservation Corps*. These recommendations have been the subject of very widespread discussion in the press and forum throughout the nation, and have already considerably influenced national and local action in behalf of youth. The Commission conceives of the national defense as requiring not only industrial and military expansion, but also the strengthening of the nation's human resources by continued advances, nationally and locally, in provision for suitable education, health service, employment, and recreation for youth. Its principal office is at 744 Jackson Place, Washington, D.C.

See COMMUNISM; JUVENILE DELINQUENCY; PRISONS, PAROLE, AND CRIME.

M. M. CHAMBERS.

**YUGOSLAVIA.** A kingdom in the Balkan region of Europe. Capital, Belgrade (Beograd). King, Peter II, who succeeded to the throne on the assassination of Alexander I, Oct. 9, 1934.

**Area and Population.** Yugoslavia occupies an area of 95,576 square miles. Its population, by estimate of December, 1939, numbered 15,703,000; by the census of 1931, 13,934,038. About 80 per cent of the people are rural. Births in 1938, 411,362; deaths, 240,302. Marriages in 1937, 117,646. Chief cities' population (1931): Belgrade (Beograd), 241,542; Zagreb (Agram), 185,581; Subotica, 100,058; Sarajevo, 78,182; Skoplje, 64,807; Novi Sad, 63,966; Ljubljana, 59,768. Included in data above, the autonomous Banovina of Croatia occupies 25,634 square miles and has 4,403,199 inhabitants (Croats, 3,325,830).

**National Defense.** Military service is compulsory. The army were said to number, on Nov. 1, 1939, 500,000 in active service and 1,340,000 trained reserves. The strength of the air force was stated as 6500 men and 800 aircraft. The navy included 1 flotilla-leader, 3 destroyers, 4 submarines, 6 torpedo boats, 8 motor torpedo boats, and 35 auxiliary vessels; naval personnel, 583 officers and 8041 men. Occurrences in 1940 caused precautionary addition to the active army.

**Education and Religion.** Attendance at school is compulsory for those of appropriate age; free, in schools under the Ministry of Education. Pupils attending in the academic year 1938-39 numbered 1,474,224 in elementary; 177,034 in secondary schools; students in universities, 16,969. By the census of 1931, 48.7 of the population belonged to the Serbian Orthodox Church; 37.45 to the Roman

Catholic Church; Moslems, 11.2 per cent; Protestants, 1.66; Jews, 0.49 per cent; Greek Catholics, 0.32.

**Production.** Agriculture supports about 85 per cent of the inhabitants. The crops of 1940 fell generally short of those of 1939, but among the cereals corn (maize) considerably exceeded 1939's production of 4,045,600 metric tons. The crop of wheat totaled 1,980,000 tons (1940), as against 2,875,600 (1939); rye, made an estimated 200,000 tons (1940), much below the 243,514 of 1939; for barley the estimate was 200,000 tons, as against 424,223 (1939); the crops of fruit were similarly deficient, the important yield of plums apparently scarcely over one-fifth of that for 1939. Other important crops, not definitely reported for 1940: potatoes in 1938, 17,016,000 metric tons; beet sugar, 1939, 108,000 metric tons; tobacco, 1939, 15,400 metric tons; hemp, 1939, 53,500 tons. The farms had the following livestock in 1938: cattle, 4,267,000; swine, 3,451,000; sheep, 10,137,000; goats, 1,890,000; buffaloes, 38,000; poultry, 22,763,000; horses, mules, and asses, 1,407,000.

Mines produced in 1939 ore containing 41,700 metric tons of copper; the output of bauxite (source of aluminum) totaled 314,400 tons; that of coal, 446,000 tons, was supplemented by a heavy output of lignite, 5,622,000 tons, and of brown coal, 1,262,533 tons, for 1938. In 1939 was mined ore containing 26,000 tons of chromite. The minerals produced in 1938 had an aggregate value of 2,230,688,000 dinars, or approximately \$50,000,000 in U.S. money. Manufacturing industries, which employed about 400,000 persons in 1938, had to do mostly with the products of agriculture; but textile production was on the increase and iron was made from native ore.

**Foreign Trade.** Exports in 1940 went increasingly to Germany and Italy and to some of the central European countries not engaged in the European War but cut off by it from distant sources of supply. For 1939 (calendar year), imports totaled 4,757,383,000 dinars (for 1938, 4,975,342,000); exports, 5,521,187,000 (1938, 5,047,433,000). Germany took 1,762,003 thousand dinars of the exports of 1939 and sent 2,268,198 of the imports; Italy took 583,516 of exports and sent 556,953 of the imports; Bohemia-Moravia took 769,203 and sent 308,809; the United States took 280,736 and sent 248,012 (all figures in thousands). The principal exports of 1939 were timber (853,102,000 dinars), swine (484,161,000), copper ore (441,428,000), and wheat (375,101,000).

**Finance.** The dinar, Yugoslavian unit of money, was commonly valued in the United States, during 1940, around \$0.0227. The Yugoslavian fiscal year ends with March 31. The expenditures of the fiscal year 1940-41 were limited by decree to the monthly rate of the year before; but the need of meeting defensive emergency nevertheless caused the issue of a constitutional decree raising the year's total permitted expenditure to 14,708.2 million dinars, as against the 12,327.9 millions spent in 1939-40 (adjusted for credits transferred to the Croatian Banovina upon the latter's receiving financial autonomy). The actual budget of 1939-40 set the government's receipts at 12,786 million dinars and its expenditures at 11,920 millions. The national debt on Mar. 31, 1939, totaled 12,620 million dinars interior and 12,000 millions exterior; these sums did not include any liability of Yugoslavia for parts of the old Ottoman and Austro-Hungarian debts.

**Transportation.** There were 6436 miles of rail-

road line in 1938; of this, 5862 miles operated by the State. Passengers on the State lines numbered 54,327,793 for 1938; the freight hauled totaled 20,759,000 metric tons for 1938 and 20,938,000 for 1939. These lines' operating revenue for 1937 was 2,211,782,163 dinars; operating expense, 1,659,484,104. The Yugoslav Air Transportation Co. flew, in 1939, 386,856 miles, carrying 12,687 passengers, 23,372 lb. of mail, and 60,639 lb. of other matter; flights numbered 2776.

**Government.** Under the constitution of 1931, Yugoslavia is a constitutional monarchy. It is subdivided into banovinas (banovine) having in general the character of administrative provinces. But by decree of Aug. 26, 1939, an enlarged Banovina of Croatia (Banovina Hrvatska) acquired a great measure of home rule, notably over finances, public education, and social and economic functions. The Yugoslavian legislative power rests in the Crown and the Parliament; the executive power in the Crown. The Crown acts through a ministry, which is not responsible to the Parliament. There are two legislative houses: the Senate, of 94 members, half of them elected and half appointed by the Crown; and the Lower Chamber (Skupština), elective, of 371 members, but temporarily in abeyance, having been dissolved on Aug. 26, 1939. King Peter being still a minor in 1940, his powers were exercised by a Regency headed by Prince Paul, cousin of the late King Alexander.

#### HISTORY

**Drift toward War.** Yugoslavia during 1940 was drawn steadily nearer to the vortex of the European War. The Chief Regent, Prince Paul, who was actual ruler of the kingdom; the government, and the mass of the population were strongly pro-Ally or pro-Soviet and just as strongly anti-German and anti-Italian. But the country was boxed between the powerful armies of Germany and Italy, while Hungary and Bulgaria both sought the return of territories lost to Yugoslavia in the Balkan and World wars. Yugoslav cities were exposed to easy Italo-German air attack. Moreover dissensions between the Serbs, Croats, and Slovenes still divided the kingdom, despite the distinctly better atmosphere created by the partial autonomy extended to Croatia and Slovenia under the accord of Aug. 24, 1939 (see YEAR BOOK, 1939, p. 815). There was religious dissension between the Serbian Orthodox and the Roman Catholic faiths. Minority groups of Germans, Hungarians, and Bulgarians, aided and directed from Berlin, Budapest, and Sofia, provided further elements of internal disunity and dissension.

These circumstances forced the Belgrade Government to follow a policy of strict neutrality as long as that proved feasible. But with the collapse of France, the entrance of Italy into the war, the adhesion of Hungary and Rumania to the Axis's "new order" in Europe, and Bulgaria's tacit capitulation to German pressure, Yugoslavia became even more isolated and its external and internal problems more menacing.

The government repeatedly reaffirmed its determination to fight any infringement upon Yugoslavia's independence and territorial integrity. It reaffirmed its neutrality when Italy entered the European War, and again when Mussolini launched his attack upon Greece. But the growing diplomatic, economic, and military pressure from Germany, Italy, and their satellite States drew the kingdom gradually into closer collaboration with the Axis.

Toward the end of the year Prince Paul ap-

peared resigned to the necessity of some form of more active co-operation with Berlin. In this he was supported by the principal figures in the cabinet—Prime Minister Dragisha Cvetkovich, Vice Premier Vladimir Matchek (leader of the Croat Peasant party), and Foreign Minister Alexander Cincar-Markovich. The Serb military leaders and the bulk of the Serb population vigorously opposed this policy. They preferred war against any odds to acceptance of a subordinate role in the Axis's "new order," which they believed meant eventual servitude and disruption of their State. Thus at the end of 1940 the stage was set for a break between the Chief Regent and the government on the one hand and the army and people on the other over the crucial issue of acceptance of Adolf Hitler's "new order" in Europe.

**Internal Developments.** Axis efforts to use Yugoslavia's internal dissensions as a lever for forcing the kingdom into the "new order" were persistent. During the German campaign in Norway in April, a simultaneous Axis propaganda drive and "war of nerves" was launched in the Balkans, with the aid of carefully organized "fifth columns" within the Balkan countries. The Belgrade authorities took the lead in repulsing this non-military offensive by breaking up the "fifth column" throughout Yugoslavia. Former Premier Milan Stoyadinovich, the most influential pro-Axis leader in the country, was arrested on April 18 on a charge of plotting the overthrow of the government and the establishment of a pro-Nazi regime with the aid of German Nazis, who had organized Yugoslavia's German minority of some 500,000. He was interned under heavy guard to prevent further contact with German agents and his own Yugoslav followers. The same measures were taken with Milan Achimovich, former Minister of Interior and Police Chief of Belgrade, and several other prominent Stoyadinovich adherents.

Defying pressure from both Berlin and Rome, the government during April and May took extensive measures to eradicate the pro-Axis subversive organization. To curb the activities of German "tourists" many foreigners were forced to leave the country and the freedom of others was curtailed. Homes of suspected fifth columnists were searched, caches of arms, ammunition, and uniforms were seized, and numerous arrests were made, particularly among the German minority. On May 18 the army requisitioned 10,000 motorcycles from the districts along the frontier inhabited mainly by Germans and Hungarians. Early in June army officers suspected of connections with the German minority were demoted.

Further measures against subversive elements were taken early in November, when the government struck at the rapidly growing semi-Fascist Zbor movement. About 100 of the chief assistants of the Zbor leader, former Minister of Justice Dmitri Ljotich, were reported to have been arrested and the headquarters were closed and sealed. On November 16 the movement was declared illegal. Ljotich himself was discovered in hiding and arrested on December 20.

The breach between the government and the army over foreign policy came to the surface as a result of repeated bombing raids on the Yugoslav town of Bitolj (Monastir), near the Greek-Albanian frontier early in November. The raids, which killed a score or more of people, were attributed to Italian planes. The army, led by the pro-Ally War Minister, Gen. Milan Nedich, favored retaliatory action against Italy. But the government,

swayed by the Slovenian Catholic leader Father Anton Koroshetz (Minister of Education and President of the Senate), who was pro-Italian in his sympathies, decided to ignore the raids. Consequently War Minister Nedich resigned on November 6. He was succeeded by the retired Gen. Petar Pesich. The death of Father Koroshetz on December 14 (see **NECROLOGY**) removed one of the principal advocates of compromise with the Axis.

War Minister Pesich on November 16 effected a shake-up in the army's high command, the most important change being the promotion of Gen. Dusan Simovich from command of the Second Army to supreme command of the Air Force. Meanwhile there had been a steady increase in the number of men under arms and in war preparations of all kinds. The compulsory military service term was increased from 18 to 24 months on August 31.

**Food Riots.** The mustering of large numbers of peasants in the armed forces reduced the harvest and added to the economic strain under which the kingdom had labored since the economic crisis of the 1930's. Large shipments of foodstuffs to Germany and Italy further restricted food supplies and, together with drastic inflation of the currency, caused rapidly rising prices. Commencing in September, this situation provoked a series of food riots and demonstrations during which numerous persons were injured in clashes with the police and many arrested. Communist agitators were said to have stirred up many of these outbreaks. They charged the government with being a "fifth column" for the Axis and demanded a Yugoslav-Soviet military alliance. On December 30 the government was moved to action by sporadic bread shortages in the capital. Corn prices were stabilized and a number of bakers and brokers were arrested on charges of hoarding and profiteering on corn, wheat, and flour. The government on March 29 had assumed complete control over foreign trade.

Other repressive measures were taken to curb anti-government agitation. All trade unions were dissolved on December 31, and further union activity was forbidden. Press restrictions, a prohibition against all Masonic activities, and discriminatory measures against Jews were carried into effect earlier in the year. Some of these measures seemed primarily intended to placate the Axis.

**Situation in Croatia.** Under Prince Paul's guidance, the policy of conciliating the Croats through the extension of autonomy was carried forward during 1940 with the co-operation of the outstanding Croat leader, Vice Premier Matchek. On January 14 Prince Paul paid a State visit to Zagreb, the Croat capital, and signed an electoral law for the election of a Croatian Diet. His cordial reception testified to the great change in Croatian sentiment produced by the 1939 Croat-Serb accord. Early in February agreement was reached for the extension of similar autonomous rights to the Serb and Slovene districts of the kingdom.

An extremist faction of Croats, demanding the complete separation of Croatia from Serbia and the acceptance of an Axis protectorate, began a terroristic campaign against Dr. Matchek's dominant Croat Peasant party. There were clashes between Matchek supporters and opponents among the students at Zagreb University and a number of the anti-Matchek minority leaders were arrested. Some of them were accused of serving the German and Italian governments.

**Defense of Neutrality.** In its feverish efforts to remain outside the widening circle of the war,

the Belgrade Government followed two major courses. It sought to play Italy and the Soviet Union off against Germany, and thus prevent the Reich from gaining a free hand in Yugoslavia. Secondly, it attempted to strengthen friendly relations with the other Balkan States and to win their collaboration in preventing the spread of the war into the Balkan peninsula. At the same time, it firmly rejected Allied and Turkish efforts to draw the kingdom into an anti-Axis coalition.

These policies determined Yugoslavia's attitude during the annual conference of the Balkan Entente held in Belgrade during February 2-4. The Yugoslav Foreign Minister opposed Turkey's suggestion that the Balkan Entente be extended to provide mutual military support against an attack upon any one of its members from any source. Thus the conference disbanded with some innocuous resolutions that offered no obstacle to Axis methods of undermining the independence of small States.

In April the British Government protested shipments of Yugoslav bauxite from Ragusa to Trieste, threatening to sink ships engaged in this traffic. Italy in turn indicated that she would not allow the British navy to interfere with neutral commerce in the Adriatic. Later the same month Italy adopted a threatening tone toward Belgrade after the Yugoslav Government had rejected a Hungarian-Italian request that Italian troops be permitted to cross Yugoslav territory to aid Hungary in the event of a Hungarian-Soviet clash. Italian troops were concentrated on the Yugoslav frontier, and Italian sources launched a propaganda drive for the expansion of Albania to include the Albanian minority residing in Yugoslavia. Simultaneously, there was an intensification of German diplomatic and economic pressure.

**Rapprochement with Russia.** Belgrade countered by sending a trade mission to Moscow on April 20 as a gesture in the direction of closer Soviet-Yugoslav co-operation. A trade and shipping accord was signed in Moscow on May 11, but the Soviet Government declined to undertake any political obligations toward Yugoslavia that would bring Russia into collision with the Axis. However the negotiations along this line were continued and resulted on June 24 in the extension of mutual recognition by the two governments. Diplomatic representatives were exchanged for the first time since the Bolshevik revolution in the U.S.S.R. Milan Gavrilovich, vigorous leader of the Serb Peasant party, was sent to Moscow as the Yugoslav Minister.

**Attempts to Placate Axis.** The rapprochement with Russia aroused more complaints of Yugoslav unfriendliness in Berlin and Rome. There were further menacing troop movements and on May 21 the Italo-Yugoslav frontier was suddenly closed. Throughout the summer the Yugoslavs watched the Italian war preparations in Albania without knowing whether they were directed against Yugoslavia or Greece. To placate the Axis, Belgrade early in October disbanded the anti-Italian Slovene Association of Yugoslav Immigrants, active for years among the Slovenian minority in Italy. The war crisis with Italy arising from the air raid on Bitolj early in November was ended November 18 with an Italian admission that Italian planes had bombed the town "by mistake." Italy expressed profound regret and undertook to pay for all material damages.

**Concessions to Berlin.** Belgrade meanwhile made placatory gestures toward Berlin in the hope

of lessening German pressures. With Yugoslav consent and the co-operation of the Vichy Government, the Reich in June succeeded in obtaining control of the French-owned Bor copper mines in Yugoslavia, the largest source of copper in Europe. In October Belgrade curtailed passenger service on the railways in order to give Germany increased transit facilities for the shipment of Rumanian oil to the Reich. At German demand, steps were taken to curb sabotage of German oil trains passing through Yugoslavia.

After four weeks of negotiation by a German economic mission, Yugoslavia on October 19 signed a new economic accord with the Reich giving Germany approximately 60 per cent of all Yugoslav exports, as against some 50 per cent under the previous agreement. The accord increased the purchasing power of the reichsmark in terms of the dinar by about 20 per cent. In announcing this agreement, Foreign Minister Cincar-Markovich declared that Yugoslavia's co-operation with Germany was "not only economic but political." On December 3 it was announced that the Germans had obtained control of the largest bank in Yugoslavia, formerly in Belgian hands. The German Consul General and leader of the German Nazis in Yugoslavia was appointed president of the institution.

These concessions brought no relaxation of German pressure. On the contrary the Berlin Government in December began to insist that Yugoslavia align itself definitely with the Axis or suffer the consequences. This demand, which was accompanied by heavy German troop movements to the Yugoslav frontiers, was in line with Hitler's decision to bring the Italo-Greek war to a close and drive the British from their foothold in Greece. To attack Greece, or force it to yield without fighting, the Germans had to cross Bulgaria and Yugoslavia. The best and safest route for a German drive on the Greek port of Salonika was down the Vardar River through Yugoslavia. Consequently the conquest of Yugoslavia by peaceful or warlike means was essential to the consolidation of Axis control over the Balkans.

Hoping to induce Belgrade to accept its assigned role in the Axis without fighting, the German Government undertook to guarantee Yugoslavia's independence and territorial integrity and to assure it of an outlet to the Aegean Sea through the cession of Greek territory. It was reported that Yugoslavia was also promised part of Albania. On December 6 Premier Cvetkovich declared that Yugoslavia was willing to participate in the creation of a new European order, but only on the basis of the retention of its security and freedom. These crucial negotiations were still in progress at the end of the year.

Meanwhile the Belgrade authorities sought to obtain the support of the Hungarian, Bulgarian, and Turkish governments in refusing to permit the movement of foreign troops across their territories. This was the primary motive for Belgrade's signature of the Yugoslav-Hungarian treaty of "constant and perpetual friendship" on December 12. Hope of Bulgaria's co-operation in resisting Germany waned toward the year's end, however, when demands for the cession of the Yugoslav portion of Macedonia were made in the National Assembly at Sofia.

See ALBANIA, BULGARIA, GERMANY, GREECE, HUNGARY, ITALY, RUMANIA, and TURKEY, under *History*; BALKAN ENTENTE; COMMUNISM; REPARATIONS and WAR DEBTS.

**YUKON.** A territory of northwestern Canada. Area, 207,076 square miles; population (1939), 4000. Capital, Dawson. Mining is the main occupation. Mineral output (1939) was valued at \$4,961,321, including gold (87,745 fine oz.) \$3,171,102, silver (3,830,864 fine oz.) \$1,551,040, lead (7,544,632 lb.) \$239,089. Fur production (1938-39) was valued at \$267,700. There were 58 miles of railway. The territory is governed by a controller and a territorial council of 3 elected members. One commoner represents Yukon in the Canadian parliament at Ottawa. Controller, George A. Jeckell (appointed June 30, 1932).

**ZANZIBAR.** A British protectorate in East Africa, comprising the islands of Zanzibar (640 sq. mi.) and Pemba (380 sq. mi.). Population (1931 census), 235,428 (Zanzibar, 137,741; Pemba, 97,687). Capital, Zanzibar, 45,276 inhabitants. Chief products: cloves, copra, sesame oil, tobacco. Trade (1939): imports, £833,000; exports, £1,167,000, including cloves (13,187 tons) valued at £857,596 and copra (10,715 tons), £81,133. Finance (1939): revenue, £484,900; expenditure, £454,700. Budget (1940): revenue, £445,800; expenditure, £435,800. The nominal ruler is the Sultan. A British Resident administers the government. There is an executive council over which the Sultan presides, and a legislative council of 15 members including the British Resident as president. Sultan, Seyyid Sir Khalifa bin Harub (succeeded Dec. 9, 1911): British Resident, John H. Hall (assumed office, Oct. 5, 1939).

**ZINC.** The war seriously disrupted the activities of the world zinc industry in 1940. When Germany overran the Low Countries she obtained control of three-quarters of the European capacity for zinc reduction, but lacked a corresponding source of supply. It was therefore inevitable that the producers whose European smelting facilities were cut off should seek an outlet for their ores and concentrates in the United States. Adequate statistics are not available, but it is known that imports into the United States, mostly from Mexico, were very heavy, also that exports of zinc products were unusually large, particularly to Great Britain. The effect of this pressure on the domestic smelting facilities was to rehabilitate several obsolete and idle smelters and to construct some wholly new capacity in an effort to satisfy the unexpectedly large demand from Great Britain. At the end of 1940 smelter production of zinc in the United States was at the rate of nearly 790,000 tons per annum, including secondary metal.

The St. Louis price for prime Western zinc clearly reflected the effect of the war. Opening the year at 5.75¢ per lb. the price rose steadily to 7.25¢ in September, at which figure it remained to the end of the year. The average price for 1940 was 6.335¢ compared with 5.11¢ in 1939. The metal was not quoted abroad because the London Metal Exchange was closed and the Ministry of Supplies fixed the price at which consumers might buy.

The Census of Manufactures, 1939, showed a general decline from 1937 in all major essentials of zinc smelting and refining. The number of establishments decreased 25 to 21. Salaried personnel and salaries; wage earners and wages; cost of materials and energy purchased, value of products and value added by manufacture were all substantially decreased. This reflected the distressed state of the industry in 1939 for which it sought relief by revocation of the tariff reduction made in the Canadian treaty. Protest against this revocation

was made without success, and subsequently the problems of the war became paramount. Postwar adjustments will probably call for further tariff consideration.

Production of primary metallic zinc in the United States from domestic ores was estimated by the Bureau of Mines to be 588,600 short tons in 1940, compared with 491,058 tons in 1939, and the largest reported since 1929. Production from both domestic and foreign ores in 1940 totaled 674,100 tons, 33 per cent more than in 1939. Electrolytic zinc accounted for 186,100 tons of the 1940 total output of primary metal. Total supply of distilled and electrolytic primary and secondary zinc in 1940 was about 721,900 tons, composed of 190,700 tons of special high grade, 101,300 tons of ordinary high grade, 62,900 tons of intermediate, 83,000 tons of selected brass special, and 284,000 tons of prime western.

Imports of slab zinc for consumption for the calendar year of 1940 amounted to 10,095 tons, according to the Bureau of Foreign & Domestic Commerce. Total imports of zinc in ore for the same period were 180,655 tons. For the entire year 1939 the respective figures were 30,960 and 36,100 tons. Apparent consumption of primary slab zinc by domestic consumers established a new high record in 1940, amounting to about 662,900 tons, an increase of 9 per cent over 1939.

**ZIONISM.** See JEWS; PALESTINE; Organizations listed under SOCIETIES.

**ZOOLOGY. Ecology and Taxonomy.** Ecology is a study of the relationship of the organism to its environment, taxonomy attempts a classification of animals and plants in accordance with their structural characteristics. The British Ecological Society held a symposium on the *Reciprocal Relationship of Ecology and Taxonomy*, the general conclusion being that the two should co-operate and be of mutual assistance. The *New Systematics*, edited by Julian Huxley, contains a series of essays by workers in ecology, genetics, and cytology, all leading to the co-operation of workers in these distinct subjects toward furthering the advance of taxonomy along more liberal and inclusive lines than frequently has been the case in the past.

As a result of recent developments, the Tennessee river has largely been converted into a series of reservoirs and this condition raises practical questions such as mosquito control and the conservation of wild life, including fisheries. A Technical Committee appointed to consider these problems made (*Science* 92, p. 201), a preliminary report on the work of 1939. The most important feature of this report dealt with the effect of insecticides (such as arsenic which may have been used for mosquito control), especially in relation to fish. So far no deleterious effect upon either fish or vegetation has been observed. Andrews, (*Ecology* 21, p. 335), found that the snail *Neritina virginea* in a salt pond in Jamaica, B.W.I., showed over a period of years that optimum living conditions resulted in a deterioration in size.

**General.** The U.S. Bureau of Fisheries and the Bureau of Biological Survey have been consolidated into a new bureau to be known as Fish and Wild Life Service (q.v.). By presidential proclamation, Barro Colorado Island in the Canal zone has been set aside for permanent preservation in its present condition. The Board of Directors are to be the Secretaries of War, Agriculture, and

Interior; the Secretary of the Smithsonian Institution; the President of the National Academy of Sciences and three biologists to be appointed. Ten thousand dollars a year has been appropriated for expenses. The Marine Biological Laboratory at Woods Hole, Mass., announced the beginning of the construction of an addition to its library to be paid for by a donation from the Rockefeller Foundation. At San Diego, Cal., the Biological Research Institution is conducting investigations into diseases and nutritional requirements of animals (*Science* 92, p. 212). The Mt. Desert Biological Laboratory in Maine reported that three new buildings will be erected for next year's use. Roy Forster was elected Director. *Nature* reported that a large number of the potentially dangerous animals, such as poisonous snakes and young lions, have been killed in the London Zoological Garden as an air raid precaution, and others removed to a shelter at Whipsnade. At the time of a raid visitors are taken into shelters and are not allowed outside until rifle patrols determine if any dangerous animals are at liberty.

**Sex Determination.** For sentimental reasons in man and of economic importance to breeders of lower animals would be the possibility of regulating the sex of unborn offspring, and for more than a century the subject has been discussed and many theories of sex determination proposed. Coe (*Science* 91, p. 175), discussed the problem partly from the standpoint of his own researches on reversal of sex where the animal is at one time of one sex and later becomes the opposite, his work having been mainly on oysters (See 1938 YEAR BOOK). In the majority of observed cases the animal is first male and later female. Coe thought that all of these phenomena support the belief that sex is determined by a qualitative balance between male determinant as opposed to female. In vertebrates it seems to be certain that internal secretions govern the determination, but this has not been demonstrated in the invertebrates. In some insects and amphibia a sex reversal may be artificially induced, but there is no reason to think that this is possible in mammals.

**Genetics.** As stated in the 1939 YEAR BOOK, Russian geneticists refused to attend the 1939 Genetics Congress held in Edinburgh. Pincus (*Jour. Heredity* 31, p. 165) stated that the Russians have formed a genetics school of their own and are discarding both the Mendelian theory as well as the pure-line hypothesis, and are basing their science on selection methods. Gardner and Newman (*Jour. Heredity* 31, p. 419), discussed the question of the relative influence of heredity and environment in forming the character of the individual, using a case of quadruplets in which two are obviously one-egg twins (e.g. arise from the division of a single egg) while the others are from two separate eggs. The first have identical hereditary equipment, while the second pair are hereditarily no more alike than any two brothers or sisters not twins. Although brought up under identical conditions, the one-egg twins retain their original differences from the others and do not tend to grow like them as they grow older.

**Embryology.** The "primitive streak" is a grouping of cells in a linear area which is the first visible indication of the developing embryo in birds and mammals and has been supposed to be an evanescent structure, disappearing early in the course of development. Streeter (*Nat. Acad. Sciences*, Oct.), announced his discovery of the fact that so far from being temporary this streak is really a

reservoir of material, "a continuing residuum of the primitive germplasm from which specialized cells and cell masses emerge to become the various body tissues," or, in other words, a supply of raw material out of which the developing embryo is built up to the final stages of its formation.

**Twinning.** As the first of a proposed series of popular scientific books published under the auspices of the American Association for the Advancement of Science, Newman, in *Multiple Human Births*, discussed the physiological, social, and psychological problems of human twinning, answering in part numerous inquiries that interested persons have proposed to him in the course of an extended study of multiple births in vertebrate animals in general. A question often asked is whether twins are or are not "desirable." His general conclusion seemed to be that because of "interference" of one twin with the other during fetal life there is in the case of twins a greater risk of injury with resulting abnormality during this period than in single births.

**Protozoa.** Jennings (*Science* 92, p. 539), showed that in a population of *Paramecium bursaria* there are series of families or clones and that in the interrelations between the individuals of one clone as well as between those of different clones there are "complicated codes of taboos, inhibitions, and permissible practices connected with the mating behavior, a complex social system." In animals in general the most primitive behavior is that involved in seeking mates and this appears even in the protozoa. Jennings concluded that this seeking of mates is the "fountainhead of both social behavior and self consciousness."

**Mollusca.** In the limpet (a snail) the conical shell accurately fits along its margin into irregularities in the rock on which it lies, this being the "home" of the snail from which it migrates in search of food but to which it returns. Hewatt (*Midland Naturalist* 24, p. 205), studied this homing process in the limpet *Acmaea scabra*. He found no evidence for geotropism or response to the pull of gravity, nor for the existence of any "homing sense." In homing the limpet retraced its outward path apparently following this through response to some sensory stimulus from something left on this path on its outward journey. If the margin of the shell is filed so that it no longer fits its home locality it will return there but is "uneasy" and will not remain for any length of time.

Galtsoff (*Biol. Bull.* 78, p. 117), found that the only stimulus leading to the spawning of female oysters is the presence of the sperm, while thermal changes may stimulate the males to discharge. In a large population, spawning by one individual chemically stimulates all of the others and advantage is taken of this fact in securing artificial impregnation of large numbers of individuals. Orton (*Nature* 145, p. 708), reported a very great destruction of English oysters in the cold winter of 1939-40. A possible cause was that the low temperature partially paralysed the adductor muscles, thus allowing injurious quantities of mud to enter the shells. A low degree of salinity in the sea water due to the melting of large quantities of snow may have contributed to this mortality. Luntz (*Science* 92, p. 310), reported that along the Atlantic seaboard an annelid *Polydora ciliata* has seriously injured the oyster crop by living in the inside of the oyster shell where it forms small blisters. Injury to the oyster is due to a restriction of its living space. The oysters are not inedible, but are unsightly and not readily salable. About

30 per cent of South Carolina oysters are reported to be infested. Prytherch (*Jour. Morphology* 66, p. 39), described the life history of a new protozoon parasite *Nematopsis ostrearum* which infests oysters from Virginia to Louisiana. It has an alternation of hosts, one host being two species of mud crab. Apparently it causes little injury if any, to the crab host, but may occur in epidemics causing a loss of from 50 to 90 per cent of oysters in both natural and cultivated beds.

**Crustacea.** The common fresh water crustacean *Daphnia* carries parthenogenetic eggs in a brood chamber and it has been supposed that the liquid in this chamber has a definite nutritive value. Obreskove and Frazer (*Biol. Bull.* 78, p. 428) showed that normal development will go on if the young are reared in sterile pond water. Lloyd and Yonge (*Nature* 146, p. 334), found in the crayfish *Crangon* a confirmation of an observation made earlier on *Homarus* (a lobster). In each a secondary sex character is the possession of special setæ on the abdomen which carry glands and to which the eggs are attached. These setæ appear only at the breeding season and possibly are produced by hormones secreted from the ovary.

**Fishes.** Huntsman and Dymond (*Science* 91, p. 447) discussed the numerous attempts that have been made to transplant Pacific salmon to streams of the Atlantic coast of North America and, although the evidence is conflicting, decided that there is no reason for believing that any of these experiments had been successful. Powers (*Science* 92, p. 353) gave reasons for thinking that a carbon-dioxide gradient in the water of rivers running into the ocean is a guiding factor in leading salmon to ascend streams. Sexually mature salmon are more sensitive to this gradient than are the immature and, hence, the former go up the streams while the others remain outside. Gudger (*Mem. Royal Asiatic Society of Bengal*) reviewed the literature of recorded cases where swordfish had attacked vessels. He considered the fish as naturally timid and not at all pugnacious, and that the attacks occur either when the fish are fighting against attacks by fishermen or, in some cases, when they are pursuing schools of smaller fishes and accidentally run into the vessel in the dark. Since a swordfish may weigh as much as 1250 lb. its momentum when swimming rapidly is very great. Cases are on record where the sword has pierced through 18.5 inches of hard wood in a ship's bottom.

Huggins (*Nature* 146, p. 206) warned conservationists that fish are the most delicately adjusted to their environments of all animals and hence most easily injured by unfavorable conditions; it is therefore desirable that before any conservation program is started a thorough study be made of all environmental conditions. The breeding habits and development of *Cladoselachus*, an archaic fish, as recorded in notes made by the late Bashford Dean, have been edited by Gudger and published in the series of *Dean Memorial Volumes*. This fish appears to be unusual in that the breeding season extends throughout the year instead of being limited

to certain months. Bridges (*Bull. N.Y. Zool. Soc.* 43, p. 74), reported the discovery in a Mexican cave of a blindfish, *Anoptichthys jordani*, in which all stages of eye development occur from complete blindness to well developed eyes. While most blindfish are found in cold water, the water in these caves is warm.

**Amphibia.** Smith (*Science* 92, p. 379) recorded observations on the mating habits of the Pacific tree frog, *Hyla regilla*. The males go into the water first and are usually more abundant than the females, so that mating takes place very soon after the females enter. Unless the females are allowed to mate, the eggs are retained in the body, and this causes the death of the animal. The maximum number of eggs laid by one female was 1250, though the average was from 500 to 700. Bragg (*Am. Nat.* 74, pp. 322 and 424), found decided and unexpected differences between the breeding habits of toads of the central and western plains and those found in the east. The eastern toad, *Bufo americanus americanus*, breeds early in the spring in pools, those of the central plains, *Bufo cognatus* and *B. woodhousii woodhousii*, usually breed only after a rain even though there may be abundant water in pools, and the breeding period extends well into the summer. Similar habits were observed in the frogs of this locality. The paper gives a detailed account of the development of the young toads of the plains living species.

**Birds.** The claim has been made, but doubted, that the hummingbird can fly backward. Tyler (*Rev. in Nature* 146, p. 466) verified this observation and describes the mechanisms involved. When backing away from a flower the bird stands almost vertical with its tail pointing forward and a little downward; in this position the beating of the wing forces the air forward away from the breast and pushes the bird backward.

The Trumpeter Swan has been so much hunted for its down and breast skin that for some time it was feared to be extinct. The press stated in September that as a result of protection in the Red Rocks Lakes refuge in Montana and in the Yellowstone Park the lowest estimate then made of the birds now living there is 212.

**Mammals.** Valuable hints to breeders of fur-bearing animals are contained in Kellogg's *Nutrition of Fur Animals*, published by the U.S. Printing Office as separate No. 177. Carr (*Bird Lore*, April-May, p. 141) reported that the introduction of beavers into the Bear Mountain Park has had important ecological consequences. As soon as ponds formed behind the beaver dams various species of birds began to nest in their vicinity, notably the Wood Duck. Woodpeckers found food in the trees killed by the flooding, and various mammals resorted to the ponds for drinking. Gradually silt washes down behind the dam and accumulates to such an extent that the beavers abandon that site and move elsewhere. This silted region is the basis for meadows which eventually form at that place. See also ENTOMOLOGY.
